Q. Are you through with the plot as it was originally?

A. With the original size of this plot, yes.

1330 Q. Now take Exhibit 48, the same property as shown after the improvement has been made.

A. After the improvement has taken place there is space left of 20,789 square feet, on the marginal street, at $6.75 per square foot; that is $139,731. There is left 19 feet on 19th Street at a value of $400 per front foot, the basis being $10,000 for a full lot; that is $7,600. Then there are two lots on 20th Street at $11,000, $22,000; then there is 15 feet on 20th Street extra at $404 per front foot, on the basis of $11,000 per full lot. That would be $6,060, a total of $175,391. Add 10 per cent., $17,539, will give you $192,930. That would show an addition of $163,470.

Q. Now, turning to Exhibit No. 49, we have block No. 666, lot 3.

A. That is an irregular sized lot here, referring to lot No. 3, between 11th Avenue and 13th Avenue, from 16th to 17th Street; that contains 8,420.8 square feet. That is on the basis of the avenue front of $6.46, $54,390. There is added to that 10 per cent. for the double frontage on the 10th Avenue basis; in other words, I have taken the value of a front foot on 10th Avenue here and I have applied the same value here (indicating) and I allow an advance of 10 per cent. on the number of square feet on account of the double frontage, these lots running from one avenue to the other. I computed the value of that and I have added a plottage of 10 per cent. on that.

Q. Plottage on a lot 24 feet on one end and 66.11 feet on the other?

A. Yes, but it is a whole block in itself, and has a connection with the water front.

Q. But plottage is for a large piece of property combined. You have practically got only two lots here.

A. That triangle—you have to pay it on account of its shape. For instance, take Broadway and 23rd Street, see what it is, and if
you want to buy that as a whole lot you have to pay extra
1331 value, not what the lots would be according to the number of
square feet represented in that triangle—or whatever it is——

Q. Well, make it triangular value.

A. Whatever it is. Now, there is an addition of 10 per cent. for plottage and 5 per cent. for the connections. That means for the conjunction with the water front here. That is $13,598, a total of $67,991.

Q. Now, if you will take the next, which is lot 12, just above, Block No. 666.

A. That contains 18,628.16 square feet; computed at the same basis, $6.46 as above, $204,379. The double frontage, 10 per cent., is $20,337; 10 per cent. for plottage and 5 per cent. for the conjunction is $30,406, leaving a toal of $224,122.

Q. If you wish to arrive at the value of the property as it is now shown on Exhibit 48, then you would deduct entirely the value of lots 3 and 12, would you?

A. I certainly would.

Q. Now, take Block 716, lot 14.

A. Block 716, lot 14, is a plot of 75 feet on the north side of 18th Street. Now I have valued this property, the land value, including the buildings, at $43,875, analyzed as follows: Three lots at $12,500 is $37,500, 5 per cent. plottage added is $1,875, which gives $39,375, plus values of buildings, $4,500, which is $43,875.

Q. Now take Block 715, lots 51 to 59.

A. 715 is on the same street, on the south side, 150 feet east of 10th Avenue. There are nine lots altogether at $12,250, that is $110,250, and a plottage of 10 per cent., $11,025, making a total of $121,750.

Q. Now, turn to the next page of Exhibit 48, block 951, lot 35.

A. I have valued that at $85,820. There are altogether 7 and 1-25th lots at $8,500 each, that is $59,840, and a plottage of 10 per cent., $5,984, which is a total of $65,820, to which I have added the
value of the buildings at $20,000, making $85,820.

1332 Q. Now take block 952, lots 7, 29, 30 and 32.

A. Block 952, the total value is $438,530, analyzed as follows: For the northwest corner of 20th Street and Avenue A——

Mr. Mathewson: Northeast you mean, don't you?

A. No, sir. Block 952 is the west corner. It is 184 feet by 517. It is the northwest corner. The northwest corner of Avenue A and 20th Street, lot 23 by 100, an inside lot, being on the basis of $12,750, plus 50 per cent. for the corner, being $19,150. The next lot adjoining the corner, 23 by 100, is $14,000. The next four lots valued at $12,750 is $51,000. The next lot is $14,000, and the corner of 21st Street and Avenue A is $19,150. Now there are 16 lots 25 by 92 on the North side of 20th Street at $8,500 a lot, which makes $136,000. There are 17 extra feet at $340 per front foot, which makes $5,786. There are 16 lots 25 feet by 92 on 21st Street at $8,000, which is $128,000, and 17 extra feet at $280, which is $4,760. The land value is $391,846, plus 10 per cent. or $39,184, which makes a total of $431,030, to which I add the value of the buildings at $7,500, arriving at the total of $438,530.

Q. Now take block 953, lot 1.

A. Block 953 is the entire block on Avenue A and First Avenue and 21st and 22d Streets, I value that at $619,136, analyzed as follows: For the Northeast corner of First Avenue and 21st Street, 24 feet 7 inches by 109, $25,500. The lot adjoining, $18,000. The next four lots at $17,000, $68,000. For the next lot $18,000. And for the corner of 22d Street, 24 feet 7 inches by 100 feet, $25,500. Now for the Avenue A front I have allowed the same as I did in block 952. That means the total of the First Avenue front is $155,000. The Avenue A front is $117,300. And Thirty-third
Street lots at $8,500 a lot is $280,500, bringing it up to
1333 $552,800, plus 12 per cent. for plottage here, which is
$66,336, making a grand total of $619,136.

Q. Now take Block 979.

A. I have valued that at $570,080, the entire block. For the northeast corner of Avenue A and 21st Street, 24 feet 7 by 100, $19,500. For the southeast corner of Avenue A and 22nd Street, $20,800. For the two adjoining lots on the avenue, each $14,000, making $28,000. For the 4 inside lots on the avenue, at $13,000, being $52,000. There are 19 4-5 lots on 22nd Street at $8,000, making $158,400. The same number of lots on 21st Street at $7,000 is $138,600. That is figured on the same principle here, making the block rectangular here (indicating), and allowing per square foot for the marginal front the same as before. There are 6,599 square feet on the marginal street, which on the basis of the Avenue A front would be $6.10 per square foot. That is $100,955. That would make altogether $518,255, plus 10 per cent., or $51,825, making $570,080.

Q. 10 per cent. is for plottage.

A. Yes, sir.

Q. Now take Block 978.

A. Block 978 I value at $539,474.

Q. With buildings?

A. Yes. The northeast corner of Avenue A, 23 by 100, the southeast corner, 23 by 100, and the plot 46 feet by 100 adjoining the corner of 20th Street, and the plot 69 feet on the avenue by 100 on

21st Street, which on account of this lot being changed I have made the avenue front here 100 feet deep, dissected the blocks, laid it out the same as it would be in case of a sale; the avenue lots would be sold 100 feet and not as they are, 70. That would be same as Block 952 opposite on Avenue A, on the basis of $12,750 per lot less the value of the plot 23 by 70 on Avenue A, which is out; altogether 16,100 square feet at $6.30, or $10,200. That is the value for that
piece of property which does not belong to the complain-t.
1334 That would be $117,300, less the value of that lot out, or
$10,200, which is $107,100. Now the northwest corner of Avenue B and 20th Street I have estimated on the basis of 23 x 100, adding 40 to the value of inside lots, making $14,000. The southwest corner of 21st Street the same, $14,000. Two adjoining lots at $11,000 is $22,000. Four inside avenue lots at $10,000 is $40,000. 14 lots on 20th Street at $8,000 is $112,000. There are 16 extra feet on 20th Street at $5,120. There are 14 lots on 21st Street at $8,000, making $112,000. There are 16 extra feet on 21st Street at $5,120. That will bring it up to $471,340, plus 10 per cent., which is $47,134, or a total of $518,474, plus the value of the buildings at $21,000, which is $539,474.

Q. Block 987 is the next?

A. 987 is the marginal Street, Avenue B, 20th and 21st Streets. There are altogether 29,745 square feet in that plot at $3.50; that is $104,000. 10 per cent. added to it is $10,400, which makes $114,400.

By Mr. **Mathewson**:

Q. What is the 10 per cent. for?

A. Plottage.

By Mr. **Page**:

Q. I suppose the same condition exists here. If this gas plant were removed this property would be worth about 15 per cent. more, would it?

A. Yes, sir. If it was removed in its entirety.

Q. Yes, in its entirety. Now take Block 1090 on page 5 of the exhibit, lot 23?

A. There are 6 lots in that plot, 24 x 100 feet 5 inches each, at $11,000, which is $66,000, plus 10 per cent. for plottage is $6,600, which makes a total value of $72,600.

Q. Take the next block, 1071, lots 10 to 13.

A. 1071 I valued at $57,200. There are four lots at
1335 $13,000 each, which makes $52,000, plus 10 per cent. plottage, or $5,200, making $57,200.

Q. Then take block 1070.

A. 1070, there are eight lots at $9,500, which is $76,000. There is added for plottage $7,600, making $83,600.

Q. Now, the large block 1089.

A. 1089, that is a block between 41st and 42nd Streets. I value that block at $957,600, as follows: Northwest corner of 41st Street and 11th Avenue, 24 feet 7 by 100, $18,000. The lot adjoining the corner, $13,000. The four next lots at $12,000 each, $48,000. The next lot $13,000, and the southwest corner of 42nd Street I allow 75 per cent. over the value of the inside lot for that, which is $21,000. There are thirty-seven lots on 42nd Street at $12,000 each, which is $444,000. There is one lot adjoining the corner, $13,000. There are thirty-seven lots on 41st Street at $7,500, which is $276,500; and one lot adjoining the corner $8,500, makes altogether $855,000; 12 per cent. plottage to that is $102,600 or a total of $957,600.

Q. That property and the blocks 1090, 1071 and 1070 would all be increased in value by the removal of the gas plant that is on this property which you last testified to?

A. More or less, yes, sir, because now, for instance, that 42nd Street, block 1071, that would only slightly be benefited and still it would be benefited, so would the others.

Q. How much?

A. I couldn't tell you that because I can't say when you are going to do that, it is all of a speculative nature or character, and I cannot discount the future.

Q. If there wasn't any gas plant there to-day how much would it be worth?

A. About 10 or 15 per cent. anyway.

Q. And 1090 would be worth a good deal more, would it?

A. Yes, sir.

Q. How much would that be worth?

A. About 15 per cent. easily.

1336 Q. And 1089 would be advanced?

A. Yes. 1089 would be largely benefited, perhaps 20 per cent.

Q. Take block 1092 on page 6 of the exhibit.

A. 44th and 45th Streets. I value that at $647,150. That is 38 lots on 44th Street at $8,000 per lot, which is $304,000; 37 lots on 45th Street at $7,500 is $277,500, a total of $581,500, plus 10 per cent. plottage, $58,150, which makes a total of $639,650, to which I add the value of buildings $7,500, making a total of $647,150.

Q. Now, take block 1093.

A. 1093, there are 33 lots on 45th Street at $7,500, which is $247,500; and 30 lots on 46th Street at $8,000, is $240,000, a total of $487,500, plus plottage of 12 per cent., or $58,500, making a total of $546,000.

Q. What size lots are the 30 on 46th Street?

A. Those lots are 25 by 100 feet 5 inches. The width of the block is 200 feet 10 inches there.

Q. But I call your attention to the fact that the dimensions as given on this map are only 500 feet on 46th Street. That would be 20 lots instead of 30, wouldn't it?

A. Yes, but where are the 250 feet to come in to the easterly line of the bulkhead?

Q. Oh, you have taken then the land in the marginal street?

A. Yes, take the land to the bulkhead line or the land marked blue on this diagram. I have taken the 250 feet eventually to be the 12th Avenue marginal street.

Q. If the company does not own that land in the bulkhead line on the part marked blue on this map, then you would have to deduct the value of 10 lots, would you?

A. Yes, sir.

Mr. **Mathewson**: No, not so much as that.

Mr. **Page**: Well, the value of 20 lots, 10 on each street.

The **Witness**: Ten on each street, that is 20 lots per block of 250 x 200.

1337 Mr. **Mathewson**: Between the present bulkhead line and the westerly margin of the projected avenue, there are about 70 feet, as I recollect it, which even on that hypothesis would belong to the company. So that it would not take out the whole 250 feet.

Mr. **Page**: But the difference would be that 65 feet would be land under water. It would not be worth much.

Mr. **Mathewson**: No, it is right next to the bulkhead line. I do not think it is land under water. I think it is land all built up.

Q. This property is also occupied as a gas manufacturing plant, isn't it?

A. Yes, sir.

Q. And if that was absolutely removed how much would it increase the value of this property?

A. About 17 per cent. That is a mere general statement on my part, you know, because I cannot tell you precisely. It would depend upon the condition of the market and the number of people that are in the market for just such property as that.

Q. Well, I suppose the number would be about the same wouldn't it, as to-day?

A. No. I believe that they would first try to sell it as a very large plot for manufacturing purposes and not for tenement houses, and it would have to be divided up into different plots. Those are all speculative things, I cannot discount them, but that is a general idea of mine that it would be about 15 per cent. anyway, 10 or 15 per cent., as the case might be.

Q. Take block 1457 next.

A. There are 19 4-5 of a lot in the street at $8,000 a lot, that is $168,400, and the plottage added is $16,840, being 10 per cent., which makes $185,240.

Q. Take the next block, 1455?

A. Block 1455 I have valued at $222,750. That is analyzed as follows: The northwest corner of Avenue A and 60th Street, 1338 25 feet 5 by 100 feet, at $15,000. The southwest corner of 61st Street, $15,000. Two lots adjoining the corner at $11,000 is $22,000. Four inside avenue lots at $10,000 is $40,000, and seventeen street lots at $6,500, that means in this number of seventeen street lots is included the 13 extra feet on each street. It would be only 16 lots and 13 feet on each street. I made it in round figures 17 lots of $6,500, which is $111,500. The total value is

$202,500, with 10 per cent. plottage of $20,250, which is $222,750.

Q. Now take Block 1474.

A. 1474 is the northeast corner of Avenue A and is an irregular plot. You have got the dimensions. There are altogether in that plot 5230 square feet. I took them at $4 a square foot, which is 55 cents less per square foot than it is on the west side of Avenue A, where it is $4.55 a square foot.

Q. Take next Block 1177.

A. Block 1177 is a value of $194,062, divided up as follows: West End Avenue front is the same as I shall give subsequently here as to Block 1157 right opposite, less 10 per cent., that is $87,500. There are 16 street lots at $5,000 each, that is $80,000, and there are 8,835 square feet at $200 a square foot, right on the retaining wall of the Hudson River Railroad Company right there (indicating) at $17,670, that is $176,420, plus 10 per cent. for plottage, or $17,642, making a total of $194,062.

Q. We will take now Block 1157.

A. 1157, that I have valued at $701,680. I valued the northwest corner of Amsterdam Avenue and 65th Street at $25,500; the southwest corner of Amsterdam Avenue and 66th Street, $25,500; the two adjoining avenue lots on the corner, $18,000 each, $36,000; the four inside avenue lots at $17,000 is $68,000. Now, the northeast
corner of West End Avenue and 65th Street I value at
1339 $14,250, the southeast corner of 66th Street, $14,250; the
two lots adjoining the avenue corners at $10,500 is $21,000;
the four inside avenue lots at $9,500 each is $38,000; and forty eight street lots at $8,000 is $384,000. The total value is $626,500, plus twelve per cent. plottage, $75,180, is $701,680.

Q. And Block 1156, lots 45 and 46.

A. 1156 is on the south side here; that I valued at $40,100. There are four lots at $8,000, $32,000. There is five per cent. plottage, which is $1,600, and the value of the buildings is $6,500, making a total of $40,100.

Q. Now, Block 1670.

A. 1670, First Avenue between 98th and 99th Streets. That block I valued at $667,184. The northeast corner of Second Avenue and 98th Street, 25 feet 11 inches x 100 feet, $23,870; the southeast corner of 99th Street and Second Avenue, $23,870; the two lots adjoining the avenue corners at $16,500 each is $33,000. Four inside avenue lots at $14,500 each is $62,000. Now, the northwest corner of First Avenue and 98th Street, $18,480; the southwest corner of 99th Street, $18,480; two adjoining lots to the corners, $13,000 each, is $26,000; the four inside lots at $12,000 is $48,000; and thirty-six street lots at $9,500 is $342,000. Now, on those corners I have allowed fifty per cent. over and above the value of an inside lot. That value would be $595,700 and adding a plottage of twelve per cent., or $71,484, gives a total of $667,184.

Q. Why do you add a plottage of twelve per cent. in this case, where you have been adding ten per cent. heretofore?

A. Well, there is a large block in its entirety with another block in its entirety adjoining owned by the same parties and both on the marginal street, which is a water front street.

Q. Well, they do not both front the marginal street?

A. That is true, but when you have two adjoining blocks in one hand and they may be both wanted together for a large con-
1340 cern, there is a larger plottage always computed in such cases than if there is a smaller plot not of a block in its entirety.

By Mr. **Mathewson**:

Q. You mean considered together, they face a marginal street?

The **Witness**: Yes. I took that item into consideration.

Q. I understand your reason now. Now take Block 1692.

A. Block 1692 I have valued at $262,697. That is the east side of First Avenue, the same value as Block 1670 opposite, less 10 per cent., that would be $99,864. Twelve street lots at $6,500 each is $78,000. Twenty extra feet on the street is $5,200. There are 10,100 square feet on the marginal streets, same value as First Avenue front, 98th to 99th street, that is $55,752, which makes $238,816, plus the plottage of $23,881, makes a total of $262,697.

Q. This is also a manufacturing station of the Consolidated Gas Company?

A. Yes, sir.

Q. And these values I suppose of yours you would estimate would increase from 15 to 20 per cent. upon the removal of the plant?

A. If the plant is removed in its entirety right away, yes, sir.

Q. Block 1683 on page 10.

A. 1683, lots 18, 34 and 35 I have valued at $118,800. That is the northwest corner of 111th Street and First Avenue, 25 feet 11 inches by 100 feet, $20,000. The next lot, $13,000; the next lot $12,000, and 7 street lots at $9,000 each is $63,000, a total of $108,000, plus 10 per cent. plottage, $10,800, gives a total of $118,800.

Q. Now take Block 1682.

A. 1682 I valued at $436,700. The northwest corner of 110th Street and First Avenue, 25 feet by 100, $18,000; that is on the basis of $12,000 for an inside lot, plus 50 per cent. The
1341 southwest corner of 111th Street I have made 26 feet 10 inches by 100. As I did in the former case, I have added a surplus of one foot 10 inches to that particular corner because it is right opposite this large public park which has been created and called the Jefferson Park, and on account of that with its extra size it is much more valuable than the lots would be if the difference was divided up and added to each lot. That corner I valued at $20,000. The two adjoining lots on the avenue $13,000 each is $26,000; the next four inside lots at $12,000 each is $48,000; there are thirteen street lots at $9,500, which is $285,000. The total would be $397,000 plus plottage of 10 per cent., $39,700, which would be a total of $436,700.

Q. For use as a gas plant that park does not enhance the value of this property, does it?

A. No, it does not enhance it now at all, but the price I give you is what it is worth to-day.

Q. If the gas plant was not there?

A. Well, if a part of it was removed. If this whole thing is gradually cleared off; for instance, if you are going to sell off portions of it gradually——

Q. If you sold off that corner, then there would be some advantage?

A. Yes, if you want to sell that front with the corner on 111th Street right opposite that park you will get more for it than I have valued it at. That is just the case as it is with the next one. I will bring you a man who will give you more than I have appraised it for.

Q. Go ahead, take block 1704?

A. I valued that at $556,827. That is the First Avenue front, which is the same as block 1682, that is $95,000. The Pleasant Avenue front at the same value, less 10 per cent., $85,500. I have sixteen lots on 110th Street at $6,000, which is $96,000; I have thirteen extra feet on 110th Street at $204 a front foot, that is
$2,650. I have sixteen lots on 111th Street at $10,000.
1342 Now those lots are the ones fronting the square, this Jefferson
Park. That is $160,000; I have thirteen extra feet there or
$5,200. The total is $493,350. I have allowed twelve per cent. plottage on that, that is $58,202, and the total is $556,827.

Q. You have allowed there for the increase in valuation because of its proximity to the park?

A. Yes, fronting on the park and fronting through on the Pleasant Avenue which is also right there a part of the park; you know from 111th Street up. The easterly side of Pleasant Avenue is all taken up by park to the bulkheads. That is a mighty fine block.

Q. Too good a block for a gas plant isn't it?

A. No, sir. If you take that block to-day and sell it for speculative purposes you will get a great deal more that I have appraised it for. I know a man who will give more than I have appraised it for, but still I don't believe it is worth that. That man figures on the resale of the property to build a saloon at a very large increase in value; in other words he expects to buy it with very little money and put a large amount of money out of his pocket into it to build a saloon and take his chances.

Q. Take block 1999?

A. I valued it at $447,700. That is two 12th Avenue corners at $15,000 each, $30,000; two adjoining lots at $11,000 each, $22,000; four inside lots at $10,000 each is $40,000, and 45 Street lots at $7,000 is $315,000; a total of $407,000 to which I added 10 per cent. for plottage $40,700, making a round figure of $447,700.

Q. Now Block 2175?

A. 2175 is a very irregular piece of property on Broadway, formerly Kingsbridge Road, northeast of Elwood Street, and running through to Sherman Avenue. That plot contains 62,523 square feet, about twenty-six full city lots, which at $1.50 per square foot would
be worth $103,162 including a plottage of ten per cent. It
1343 means the land without the plottage would be worth $93,784
and a plottage of $9,378.

Q. How much per square foot did you say that was?

A. $1.50 a square foot.

By Mr. Mathewson:

Q. How many feet?

A. 62,523 square feet; that is the nearest I can come to it.

Mr. Page: That is all I wish to ask.

Cross-examination by Mr. Burr:

Q. How long were you engaged in making this appraisal?

A. It must be between seven and eight weeks now.

Q. It took you all that time, did it?

A. More or less. I went over it twice just to be perfectly satisfied. I walked over every inch of ground.

Q. Where did you take your dimensions from?

A. I took the dimensions from the blue print that I have here.

Mr. Mathewson: Exhibit No. 48?

The Witness: Yes. Where there was a discrepancy I took it from the city maps, so I have not in every instance followed exactly the dimensions given here in this blue print.

Q. You did not take the dimensions in any event from the deeds themselves, did you?

A. No, sir, from the diagrams furnished me here by the gas company and where I saw, compared with the city maps, that there was a discrepancy, I made inquiries and I was told by the engineer that the discrepancy might possibly be due to their having drawn their diagram according to old deeds and lands actually in possession, whereas the city maps would show more or less.

1344 Q. I notice you made a 5 per cent. allowance for the conjunction of the land with the bulkhead?

A. Yes, sir.

Q. You said the other experts allowed it to the bulkheads itself.

A. Well, that is optional. I believe that when you own a plot of ground with water front opposite the real value of the water front goes in the land and not the land value to the water front.

Q. Well, that 5 per cent. would not be allowed if the street was opened and in use between the bulkhead and the land on the other side?

A. I have not allowed 5 per cent. for the conjunction in any instance where there is a street to run through. There I have omitted the plottage altogether. I have omitted plottage on 41st and 42d Streets, on 44th and 45th Streets, and 45th and 46th Streets, because it does not run through there. I have allowed nothing for plottage there, but that land runs out under water.

Q. What have you allowed at 98th and 99th Streets?

A. 98th and 99th Streets I have allowed nothing.

Q. Didn't you allow plottage there at 12 per cent.?

A. Yes, plottage at 12 per cent. but not for conjunction.

Mr. Mathewson: Plottage and conjunction he uses as two different terms.

The Witess: Or call it connection with the water front, or connection with the bulkhead, that is what I generally call it.

Q. Did you examine these buildings when you were seeking to ascertain their values?

A. Yes—not the value of the gas plants, although I went through all the buildings in every gas plant in every block. I went and saw every building, but then I was ordered to value only those buildings that were occupied by tenants.

1345 Q. Did you ascertain the rentals received from those buildings occupied by tenants?

A. Yes, sir; I did.

Q. Now, taken as a whole, has this property improved in value within the last year?

A. Well, it has on general principles, like everything; it has increased all over the city as a whole, and certainly a portion of that increase has reverted to that property.

Q. Well, about what per cent. of increase would you place on this property within the past year?

A. Within the past year? Well, that is hard to say.

Q. Well, within the past two or three years?

A. Within the past two or three years it might be about 10 per cent.

Q. Not more than that?

A. Well, it would depend where the property is located. As you take property for instance on Lexington Avenue and 116th Street, Irving Place or on Third Avenue, it is a different computation than if you go away down on the East Side.

Q. Well, take 42d Street, the West Side?

A. At 42d Street I think that has appreciated at least 10 per cent. during the last three years, perhaps more.

Q. Take 98th and 99th Streets on the East Side. That is a thickly populated neighborhood, isn't it, between First and Second Avenue?

A. Yes, sir, it is.

Q. How much has that appreciated?

A. Well, certainly 10 per cent.; certainly, if not more.

Q. That is a growing neighborhood, isn't it?

A. Yes, sir.

Q. How much in your opinion will it increase in value in the next two years?

A. I could not tell.

Q. You are now undertaking to give the present day value of this property, are you?

A. I am, yes, sir.

1346 Q. And what you believe it would realize if sold to-day?

A. Yes, sir.

Q. And you have testified that without the gas plants on such property that the value would be enhanced or increased from 15 to 20 per cent.?

A. Yes, sir, if sold simultaneously, in one lump, you know, and the whole land cleared up.

Q. When you say simultaneously you do not mean to say if all this property were sold at once, do you?

A. Well, in the plants for instance, if you were to remove all the gas plants from 14th Street up to 16th Street on one occasion, or all the plants on Avenue A from 19th to 20th Streets, it would be a different thing, and it would not necessitate the sale of the whole property together, all that property. I believe that auction prices would go from 10 to 15 per cent. higher if that whole thing was put up at auction.

Q. And has not that property increased over 30 per cent. in value since 1884?

A. Well, I cannot tell that; I have not computed that.

Q. You would not say it had not?

A. I would not say it has not and I would not say it has, for the reason that I have not investigated it.

Mr. **Burr**: That is all.

Redirect examination by Mr. **Mathewson**:

Q. In addition to your own dealings in real estate have you up to date kept track of sales of property, recorded sales and considerations all over the city?

A. Yes, sir.

Q. So that you have kept a record of transactions in which you had no part, as well as those in which you did have part, so far as possible?

A. Certainly.

Q. And in making your estimates which you have given here, did you take into consideration and make a study of actual transactions, whether by you or by others, so far as you could
1347 ascertarin them?

A. Yes, sir.

Q. I understand that your estimate of values here is as the company is now in possession of the property?

A. Yes, sir.

Q. You say that in some cases you examined the city's maps?

A. Yes, sir.

Q. You did not find any material or substantial differences from the dimensions shown on Exhibit 48, did you?

A. Not in general; only on one, and that is 14th to 15th Streets and Tompkins Street.

Q. Was that a large difference?

A. It was a difference of about two feet.

Q. That is all?

A. That is all.

Q. Now, I understand that the value you have testified to here is what you call the value to-day?

A. Yes, sir.

Q. That is what the company might realize for the property if sold off in ordinary course?

A. Yes, sir.

Q. But you think that if these gas manufacturing plants were removed all at a time that that would increase the figures you have testified to by the percentage which you have named?

A. Yes, sir.

Mr. **Mathewson**: That is all.

Recess until 2 P. M.

1348 After Recess.

Frederick J. Mayer, called as a witness on behalf of the complainant, being duly sworn, testified as follows:

Direct examination by Mr. **Mathewson**:

Q. What is your age?
A. Fifty-four.
Q. What is your business?
A. Mechanical engineer.
Q. For how long have you been a practicing mechanical engineer?
A. Thirty-four years.
Q. Are you a graduate of any technical institute?
A. Yes, the School of Technology, Stuttgart, Germany.
Q. What year?
A. 1872.
Q. Are you connected now with any firm?
A. I am not.
Q. Where is your place of business?
A. Baltimore.
Q. Were you ever connected with the firm of Bartlett, Hayward & Company?
A. Yes, I was their chief engineer for 23 years, and altogether with them for 33 years.
Q. Have you ever had anything to do with the construction of gas works and apparatus?
A. Yes.
Q. How much and how long?
A. During the last 25 years.
Q. Has gas work construction been a specialty of yours and this firm of Bartlett, Hayward & Company?
A. Yes, entirely.
Q. During that time with how many gas works have you had to do in the construction of, do you think?
A. I have designed and constructed in the neighborhood of 100 complete plants, fuel, coal and water gas plants.
Q. Where?
A. Throughout the entire country.
1349 Q. Any outside of this country?
A. Yes, partly in South America and Cuba.
Q. Have you ever designed and constructed any gas holders?
A. In the neighborhood of 400, yes, sir.
Q. Did you have anything to do with designing and constructing the heating and ventilating plants of the United States Government at Washington?

A. Yes, previous to taking up gas works construction I made plans for the heating and ventilating of all the large government buildings at Washington.

Q. With the exception of the Capitol?

A. No, sir, that was not in it, no, sir.

Q. In addition to this gas works construction, which you have testified is a specialty, have you ever been engaged in structural work for buildings other than gas plants?

A. No, sir.

Q. Have you examined and appraised the manufacturing plants of the Consolidated Gas Company on the Island of Manhattan?

A. I have.

Q. What time was consumed in such appraisal and examination?

A. I have been working with 12 people altogether for the last six weeks, day and night and Sundays included; very often as late as midnight. I should judge that would be equivalent, ordinary working time, in the neighborhood of three months.

Q. Have you personally examined these plants?

A. I have.

Q. And the apparatus in them?

A. Yes.

Q. Every piece of it, which you have valued?

A. Yes.

Q. Have you examined the buildings?

A. I have.

Q. How about the holders which you have valued?

A. I also examined the holders, yes, sir.

Q. Are you able to state the value of the plants as they exist to-day?

A. I am, sir, yes.

1350 Q. The values which you are about to give mean the cost of reconstruction of the plant new to-day, or is depreciation taken out or deducted, where you have observed any depreciation?

A. My figures are based on prices of to-day, allowing for depreciation dependent upon the condition of each apparatus, building or holder.

Q. So that your figures have taken into account depreciation and deducted it?

A. They have in each instance.

Q. If these plants were to be reconstructed new with the same capacity and of the same character, would such cost of construction therefore be greater than the figure at which you have appraised them?

A. Yes, sir.

Q. I will ask you to take first the 14th Street plant of the company, located between 14th and 16th Streets on or near the East River. What sort of plant is that?

A. A coal gas plant, five million cubic feet capacity a day.

Q. And generally speaking, what area does it cover, how many blocks?

A. I would have to refer to the plans, I did not put the streets down; I have not got the plans here.

Q. Did you personally go over this?

A. I did, repeatedly.

Q. What is the value of the buildings there?

A. For the 14th Street plant——

Mr. PAGE: I object to the giving of this testimony in a general way. Find out what buildings there are.

Mr. MATHEWSON: That has already been testified to, what the buildings are.

Mr. PAGE: No, it has not been testified to at all; not a line of testimony about it.

The MASTER: Why not ask him to describe the plant generally?

1351 Q. Well, describe the plant and buildings. You have stated what the character of the plant is.

A. There is an office building—do you want the dimensions of it?

Q. Yes.

A. (Continuing:) 42 feet by 32 feet 6 inches by 23 feet 9 inches high, to the underside of the roof frontage.

Q. Go on with the other building.

A. A pay room attached to this building, a two-story brick building 28 feet 1 inch by 13 feet 1 inch by 23 feet high.

Building over alley, one-story, 11 feet wide 28 feet 1 inch by 10 feet 10 inches.

Store room, two-story building, 21 feet 9 inches by 28 feet 1 inch by 23 feet high.

Boiler room, one-story building, 28 feet by 44 feet by 24 feet high.

Engine room, two-story building and attic, 44 feet by 13 feet 10 inches by 24 feet high.

Exhauster house, two-story building, 28 feet 1 inch by 20 feet 6 inches by 23 feet high.

Machine shop and store, 47 feet by 28 feet by 23 feet.

Smith shop, 35 feet by 52 feet 2 inches by 23 feet high.

Condenser house, one-story building, 54 feet 1 inch by 36 feet 6 inches by 27 feet high.

Shed, one-story building, with galvanized iron sidings 38 feet 3 inches by 31 feet by 11 feet 6 inches high.

Large purifier house, 67 feet by 127 feet by 24 feet high.

Small purifier house, 40 feet 5 inches by 67 feet by 16 feet 6 inches high.

Oxide house, 37 feet 10 inches by 67 feet by 16 feet 6 inches high.

Meter house, 33 feet 7 inches by 40 feet 4 inches by 24 feet high.

1352 Center seal house, 16 feet by 16 feet 2 inches by 14 feet 9 inches high.

Another house of same description and dimensions and for the same purpose.

Boiler house, one-story brick building, 15 feet 2 inches by 38 feet 10 inches by 16 feet 6 inches.

Valve house, one-story and basement brick building, 12 feet 3 inches by 21 feet 4 inches by 12 feet 6 inches.

Now, before I have any other buildings I have the brick walls, to the boiler yard. Do you want those, or shall I continue with the buildings.

Q. Just continue with the buildings?

A. Retort house, one-story brick building, 185 feet 9 inches by 245 feet 4 inches by 22 feet 9 inches.

Scrubber house, one-story brick building, 48 feet 3 inches by 12 feet by 16 feet 5 inches.

Then there are some more walls around the property, brick walls.

Q. Are those included in the value of the buildings?

A. They are on the building schedule.

Q. Just mention them as they go along then, I did not understand it?

A. There is a brick wall around the holder yard; north wall 351 feet 2 inches long, south wall 366 feet 6 inches, west wall 207 feet.

By Mr. Page:

Q. How high and how thick are the walls?

A. They average 12 inches, with 20-inch pilasters, 3-inch stone coping and 3-inch water tables. The average height is about 12 feet above grade line.

Walls between Avenue C and D, 23 feet 7 inches on 14th Street and 245 feet 4 inches on 14th Street. That forms part of the retort house wall; that is a continuation of it. Two walls, one on 14th Street, and one on 15th Street, each 131 feet 6 inches long. All of those walls are 12 inches with pilasters, with water tables and stone copings.

1353 Shed 75 feet 6 inches by 21 feet 6 inches by 17 feet, covered with corrugated iron on wooden framing.

Another shed, same description and dimensions.

Coke storage, 131 feet 6 inches by 63 feet 8 inches. The two end walls are formed by the walls of the retort house and coal shed. The two long walls are formed by brick piers, 28 inches square, with arches between the piers.

Gas engine house, one story brick building, 13 feet 3 inches by 41 feet 6 inches by 11 feet 3 inches.

Coal hopper, 21 feet 6 inches by 63 feet by 32 feet 7 inches, one-story.

Coal shed, one story brick building, 184 feet 5 inches by 206 feet 6 inches by 26 feet 6 inches.

Rigging house at end of coal shed, two story building, 22 feet long by 13 feet 6 inches by 20 feet high.

Small office building 10 feet by 10 feet by 10 feet high.

A. Coal and coke storage. There are four lots, with cover the length of 282 feet 8 inches on the northside, 371 feet 11 inches on the south side, 226 feet 6 inches on the east side and 206 feet 6 inches on the west side. These lots are surrounded by timber fences and timber trestle work, arranged for coal handling machinery.

Another boiler and engine house combined, one-story brick building, 11 feet by 25 feet by 20 feet.

Another boiler house 16 feet by 28 feet 1 inch by 11 feet.

A circular brick building, 11 feet diameter, 54 feet high.

Another boiler house. One-story frame building 32 feet 5 inches by 16 feet by 11 feet 6 inches.

Valve house, one-story frame building 12 feet 4 inches by 10 feet 4 inches by 9 feet 6 inches.

1354 Exhaust house. One-story brick and basement building, 50 feet 8 inches by 43 feet 4 inches by 20 feet 3 inches.

Boiler house. One-story brick building, 27 feet 8 inches by 32 feet by 20 feet 2 inches.

Foundations for tar and ammonia tanks.

Coke office, one-story brick building, 9 feet 5 inches by 15 feet 5½ inches by 13 feet 10 inches.

Boiler house. One-story brick building, 18 feet 5 inches by 19 feet 2½ inches by 17 feet one-half inch, or an average of 16 feet high.

Clay mill. One-story frame building, 17 feet ½ inch by 29 feet 6 inches by 12 feet 3½ inches.

Clay storage. Similar building, 20 feet 3 inches by 19 feet ½ inch by 14 feet 9 inches.

Storage shed. One open frame shed, 33 feet 5½ inches by 40 feet by 9 feet 10 inches.

Another shed of similar description. 36 feet 1 inch by 19 feet 4 inches by 8 feet 11 inches high.

Stable. Two-story brick building, 50 feet by 32 feet 1 inch by 26 feet 11½ inches.

Storage shed. One-story open-frame building, 19 feet 6 inches by 84 feet 11 inches by 11 feet 4½ inches.

Carriage room, called Shed No. 1. One-story frame building, 19 feet 10 inches by 19 feet 10 inches by 10 feet 4½ inches.

Pump house. One-story frame building, 11 feet by 13 feet 2 inches by 8 feet 6 inches.

Another storage shed. One-story brick building, 20 feet 9 inches by 46 feet 8 inches by 12 feet 10 inches.

Another storage building. One-story brick, 21 feet by 36 feet 4 inches by 12 feet 10 inches high.

Another storage shed, 25 feet 10 inches by 31 feet 2 inches by 10 feet high.

Q. Brick also?

A. No, corrugated iron on the east and north sides; the fence forms the south and west sides.

1355 Fences: One iron fence, 381 feet 3 inches, 5 feet high; 251 feet iron fence, 4 feet 6 inches high; 715 feet iron fence, 3 feet high; 296 feet 6 inches, timber fence, 12 feet 6 inches high; 1,170 feet wooden fence, 9 feet 6 inches high; 605 feet of plank fence, of 3-inch plank, 13 feet high; 480 feet of wooden fence, 1-inch boards, 8 feet high.

Paving in holder yard: 11,140 square feet of brick, laid flat.

Another boiler house. One-story brick building, 18 feet 4 inches by 20 feet by 20 feet 9 inches long.

Weigh office. One-story and basement brick building, 16 feet 5 inches by 26 feet 6 inches by 13 feet 2 inches.

Another storage building. One-story brick building, 8 feet by 7 feet 11 inches by 7 feet.

Another valve house, 10 feet by 7 feet by 12 feet.

Another boiler house, 14 feet by 20 feet by 13 feet.

Now, pile foundation on the north side of 15th Street, for a similar foundation as coal handling trestle on opposite side of the street.

A portion of a newly erected boiler house, now in course of construction.

Foundations for tower scrubbers.

Concrete: 34 feet wide, 64 feet long, 4 feet deep. That is all for the buildings.

By Mr. Mathewson:

Q. Have you carefully estimated the value of the buildings and structures which you have just enumerated and making deduction for deterioration or depreciation wherever you found it to occur?

A. I have.

Q. Will you state the value of those structures?

A. $691,961.

Q. Will you now describe generally the apparatus at the 14th Street plant which you have examined and valued?

1356 A. The entire apparatus consists of all the machinery required to produce 5,000,000 feet of coal gas in 24 hours, consisting of the ordinary apparatus, including benches, purifiers, exhausters, the boilers, scrubbers, condensers, meters, pipe connections and so forth that make a complete plant.

Q. All contained in the structures which you have just valued?

A. Yes, sir.

Q. What is the value of such apparatus, making similar deduction for depreciation where you found it to occur.

Mr. Page: I object to the question as calling for a conclusion, without any detail, not based upon anything in the case.

The Master: I will allow it.

Mr. Page: Exception.

A. In detail?

Q. Well, I think I will let you give it. Yes, you may proceed and state the apparatus which you are about to value?

A. Now, together with the apparatus I have included all the contents of all the other buildings before mentioned, such as office buildings.

Q. Yes.

A. There is —— office building; contents:

One bookkeeper's desk.

One iron safe.

One roll-top desk.

One chair.

One flat-top desk and chair.

One lavatory and toilet.

One washstand.

Three Black walnut closets.

The Master: Excuse me a minute. Wouldn't it be possible to have these schedules or copies of them submitted as part of the witness' testimony, asking him the general questions about the
1357 value and then put those in evidence. In other words, is it necessary to sit here and by question and answer have all these items of office desks and waste baskets spread out on this record?

Mr. Page: No objection if we can have an opportunity to examine the exhibits so as to make a proper cross-examination. They probably could not be printed inside of some weeks.

The Master: That is merely a suggestion. That would be my way of doing it. But go on, if counsel insists on having it this way. Proceed.

Mr. Page: We do not insist.

The Master: I understood you did, Senator. I understood you objected to a general description and you wanted him to state the particulars.

Mr. Page: I just stated I would be perfectly willing if they would submit this schedule, or if they would give us a copy so that we would have an opportunity to examine properly. If offered in evidence in this form it probably wouldn't be printed for several weeks yet.

Mr. Mathewson: If you wish, I can give you a copy of the description of this apparatus which the witness is referring to now as the witness would read it, and a description of that which he values. There are pages of it.

Mr. Kirby: If counsel would have a statement prepared giving an inventory of the plants and the value the witness puts upon them that will do.

Mr. Mathewson: You have the value in the testimony, Mr. Kirby.

The Master: You may go on, Mr. Mayer.

The Witness (continuing): One bookkeeper's desk, two
1358 roll top desks, one safe, one flat top desk, and typewriter, one washstand, one 5 foot meter purifier, one drawing case filled with drawings, one toilet, one sink, chemical apparatus and books.

In the storeroom; contents: small oil tanks and work bench and some junk.

In one of the boiler houses: One Roland, 60 inches by 16 inches, 80 horsepower boiler.

One Clark's steam and fire regulator.

One cast iron tank, 32 feet by 48 feet by 4 feet 6 inches deep over the boiler house.

Mr. Mathewson: In view of the time consumed in reciting these details we will prepare and deliver the description of the apparatus and contents for the total value of which I have just asked the witness, in lieu of the witness reading the items, if that is acceptable, Senator?

Mr. Page: Yes.

Q. Now will you state the total value of the apparatus and contents of the buildings to which you have referred and which apparatus and the contents you began to enumerate?

A. $578,940.

Q. Does that allow for depreciation wherever you found it to occur?

A. Yes, sir.

Q. Have you appraised what are known as the connections or yard connections of the 14th Street plant?

A. Yes, sir.

Q. That is not long, is it?

A. No, it is very short.

Q. Just state what they are and their value in toto?

A. There is cast iron pipe from 2 inches to 30 inches in diameter, 1079.58 tons, 22,523 feet.

Wrought iron connections, 1 inch to 4 inches in diameter, 7,425 feet.

Valves:

Six 1 inch.
1359 Twelve 1-½ inch.
Seven ¾ inch.
Ten 1-¼ inch.
Four 2 inch.
Twenty-two 4 inch.
Five 6 inch.
Three 10 inch.
Seventeen 12 inch.
Four 16 inch.
Fourteen 24 inch, three way valves.
Forty-eight 20 inch.
Sixty-seven 30 inch.

Q. What is the total value of those yard connections?

A. $146,895.

Q. Will you now enumerate the holders connected with the 14th Street plant?

A. Six gas holders of 345,500 cubic feet capacity each; two gas holders 250,000 cubic feet capacity each. The six holders are all provided with brick tanks constructed upon pile foundations.

Mr. Page: What about the other two?

The Witness: I only gave you six.

Mr. Page: You gave us eight.

The Witness: It should be eight. The holders are all alike, six and two. There are 8 holders and 8 tanks.

Q. Is that all?

A. That is all for the holders.

Q. What is the total value of those holders, considering their condition to-day?

A. $475,356.

Now, holders in steel tanks, one holder, 3,250,000 cubic feet capacity. This holder has a concrete foundation constructed upon piles and surrounded by a retaining wall. The total value?

Q. The total for holders?

A. Holders in steel tanks, $314,248.

1360 Q. What is the total of holders both with and without steel tanks?

Mr. Page: There is just one steel tank holder, is that it?

The Witness: Yes, one steel tank holder. You want the total of all the holders?

Q. Yes.

A. The total of all holders is $789,604.

Q. In these holders I assume you have included the pile foundations and the retaining walls, etc., where they exist?

A. Yes, sir.

Q. And the tanks?

A. Yes, sir.

Q. Will you now state the total value of the 14th Street plant, including buildings, apparatus and contents, yard connections and holders to which you have testified?

A. To those prices which I have given must be added an item of 10 per cent. for general engineering and drawings and gradings, pavings, curbing, sewerage, drainage, temporary fences operating tools and other utensils used for operating of plant. Water for holder tanks and other items which I overlooked in my examination.

Q. How much is this additional 10 per cent.?

A. For the buildings it is $141,779. For the holders it is $78,960. And then there is an interest charge of 5 per cent., amounting to $77,978 in the instance of the buildings, and $43,428 in the instance of the holders. What I mean by buildings, that includes buildings, apparatus and pipe connections, that first total item.

Q. Did you say $140,000 on buildings?

Mr. Page: He says he meant buildings, apparatus and pipe connections.

The Witness: Yes, everything except the holders.

Q. And connections?

A. Yes, sir, everything except the holders. That makes a
1361 total for everything except the holders of $1,637,553, and
everything for all holders $911,992; a total for the entire
plant of $2,549,545.

Q. Is that what you consider the value to-day, having allowed for depreciation wherever you found it to occur?

A. You must excuse me one moment. I make the total value here $2,549,545, but there seems to be a discrepancy between my summary figure and my figure on the detailed sheet. I would like to look that over and see if there is any difference in it. The value is $2,549,545.

Q. To-day, allowing depreciation?

A. Yes, sir.

Q. Now, upon what do you base this 10 per cent. allowance for engineering and other items to which you have referred?

A. That is the general engineering and making of plans for the entire plant.

Q. Based upon your experience and study?

A. Yes, sir.

Q. Do you consider that a fair figure?

A. I consider it a low figure. In order to establish this figure I went especially to Baltimore a week ago for twenty-four hours in order to look over my records and I found that this item averages nearer 15 per cent. than 10 per cent.

Q. You took the 10 per cent. so as to be conservative?

A. I made the 10 per cent. so as I would be sure not to value it too high.

Q. Now, the 5 per cent. interest is based, is it not, upon the assumption of the time it would require to build a plant of this kind?

A. Yes. It will take on an average two years to build a plant of this kind, any one of these plants.

Q. So assuming the construction to progress favorably, that would make a year's interest on the whole sum?

A. Yes. Of course, in the beginning you have very little expenses, and they gradually accumulate as you proceed with
1362 the construction, so I have assumed an average of one year
on the total amount.

Q. Now, Mr. Mayer, will you take what is known as the 42d Street Plant, located at 42d and 43d Streets and the North River. State whether you have examined the buildings, apparatus and yard connections and holders forming part of or connected with that plant?

A. Yes, sir.

Q. Will you describe the buildings briefly as you did before in reference to the 14th Street plant?

A. Yes.

One valve house, octagonal brick building, 21 feet 10 inches by 12 feet high. That is, 21 feet 10 inches between the parallel sides.

One meter house, one-story brick building, 10 feet 8 inches by 22 feet 3 inches and 9 feet 6 inches high.

Purifier house; one-story frame building, 160 feet by 76 feet by 20 feet.

Engine and meter house, two-story brick building, 14 feet 6 inches by 59 feet 6 inches by 28 feet.

One toilet building, one-story brick, 5 feet 6 inches by 5 feet 6 inches by 8 feet 6 inches.

One retort house, 261 feet 2 inches by 62 feet 2 inches by 27 feet high.

Condenser and scrubber house, two-story brick building, 23 feet 3 inches by 60 feet 2 inches by 42 feet high.

Retort houses No. 2 and 3, 100 feet 4 inches by 118 feet 3 inches by 24 feet high.

Exhauster and engine house, one-story brick building, 28 feet 6 inches by 100 feet 4 inches by 24 feet high.

Retort house No. 4, one-story brick building, 34 feet 4 inches by 38 feet by 24 feet high.

South and north walls of Nos. 1, 2 and 3 retort houses.

Wall between purifier and exhauster houses.

One shed, 12 feet by 140 feet by 12 feet high.

1363 No. 1 coal shed, one-story brick building, 171 feet by 90 feet by 21 feet 9 inches high.

Runways in coal sheds. Two runways 9 feet wide, 170 feet long.

No. 2 coal shed, two-story brick building, 89 feet 9 inches by 171 feet by 29 feet high.

Carpenter shop. Small room partitioned off in second story of No. 2 coal shed.

Brick fence on Eleventh Avenue, 195 feet 10 inches, 9 feet above grade, 16 inches thick.

One wrought iron picket fence, same length as brick wall.

Brick fence on 42d Street, 235 feet 3½ inches long.

Stable and wagon shed, 98 feet 9 inches by 67 feet 10½ inches by 18 feet high.

Eastern extension of above building, 32 feet 10½ inches by 30 feet 4 inches by 10 feet high.

Additional extension, 32 feet 10½ inches by 26 feet 6 inches by 14 feet high.

Storage building, one-story brick, 34 feet by 24 feet 6 inches by 20 feet.

Harness house, 16 feet 6 inches by 16 feet 6 inches by 18 feet high.

Coke storage office, 15 feet, 4 inches by 7 feet 4 inches by 13 feet 6 inches.

Iron bridge crossing Twelfth Avenue. Span, 100 feet by 12 feet wide.

Frame building for deodorizing purposes 26 feet by 20 feet 4 inches by 12 feet high.

One timber pump house, 20 feet by 10 feet by 10 feet.

One timber ash dump.

Timber retaining fence for coke storage 700 feet. That is all.

Q. What is the capacity of this plant, Mr. Mayer?

A. 4,500,000 cubic feet of coal gas.

Q. Per day?

A. Per day, yes, sir.

1364 Q. What is the value of the buildings and structures which you have just enumerated at that plant, allowing for depreciation wherever you observed it?

A. For the buildings alone?

Q. Yes.

A. $598,848.

Q. Did you also examine and value the apparatus and contents of the buildings?

A. Yes.

Q. Of the 42nd Street plant?

A. Yes.

Mr. **Mathewson**: I will furnish counsel a similar description to that which we propose for 14th Street.

Q. Without taking time to enumerate them on the record will you state what the value is of the apparatus and contents at 42nd Street, depreciation deducted where you found it?

A. For the apparatus $551,743.

Q. Will you now describe the yard connections or general connections of the plant if you valued them separately?

A. Cast iron pipes and connections from three to thirty inches in diameter, 18,129 feet; steel riveted pipes from 20 to 24 inches in diameter 540 feet; wrought iron pipe connections, three inches and less, 2,800 feet; valves, three 30 inches, thirty-four 24 inches, eleven 20 inches, fifteen 16 inches, twenty-five 12 inches, three 10 inches, and ten 8 inches.

Q. What is the total value of those connections?

A. $134,157.

Q. And you also examined and valued the holders connected with the 42nd Street plant?

A. Yes.

Q. Please describe them and give their values.

A. There are four holders of 250,000 feet capacity each, with brick tanks constructed on pile foundations. The total cost of those holders—do you want the cost?

Q. Yes, go ahead.

A. $225,778.

1365 Q. You mean value, the same as you have been testifying, $225,778?

A. Yes.

Q. Are those items exclusive of the 10 per cent. engineering and the five per cent. interest?

A. Yes.

Q. Will you now state what additions you make to the figures you have given to get the entire value of the plant.

A. The entire cost of all the buildings, apparatus and connections, with ten per cent. for contingencies and five per cent. for interest amounts to $1,483,888.

Q. How much does the ten per cent. additional for engineering amount to? And how much the five per cent. for interest?

A. On the items above referred to $128,474 for contingent fees and $70,666 for interest.

Q. This value of $1,483,888, do I understand is the value to-day, allowing depreciation and deducting it where you find it to occur?

A. Yes, sir.

Q. Are there any additions which should be added, or any other items additional at 42nd Street?

A. Yes, the same ten per cent, for contingencies and five per cent. for interest on the value of the holders, which amounts to $22,577 for contingencies, and $12,417 for interest, making a total value for the holders, of $260,772, and the value of the entire plant, $1,744,660.

Q. The $1,483,888 did not include then the holders?

A. It did not.

Q. Nor the 10 per cent. and the 5 per cent. computed on them?

A. Not on the holders, no, sir.

Q. So that the total valuation is how much now to-day, deducting depreciations?

A. $1,744,660.

Q. The 42nd Street plant is a coal gas plant?

A. Yes, sir.

Q. We will now take the 44th Street plant; have you also examined and appraised the apparatus and contents, connections and holders there located?

A. Yes.

1366 Q. What kind of gas is manufactured at 44th Street?

A. Water gas.

Q. What is the capacity of the works?

A. 8,500,000 cubic feet per day.

Q. Will you now describe the buildings there in the same manner as you have for the other plants, briefly?

A.—

Governor house, octagonal building, 11 feet 2½ inches between parallel sides, 16 feet high.

Valve house, octagonal brick building, 9 feet 7 inches between parallel sides, 18 feet 6 inches high.

Carpenter shop, two-story brick building, 26 feet by 35 feet 6 inches by 30 feet.

Lumber shop, 25 feet by 28 feet by 22 feet.

Purifier house, one-story brick building, 155 feet 9 inches by 65 feet 8 inches by 30 feet.

Oxide room, included in purifier house.

Meter house, two-story brick building, 43 feet 9 inches by 45 feet 1 inch by 37 feet 6 inches.

Condenser house, 44 feet 10 inches by 49 feet 8 inches by 32 feet 10 inches high.

Engine house, two-story brick, 49 feet by 44 feet 10 inches by 47 feet 1 inch.

Generator house, two-story brick, 139 feet 9 inches by 65 feet 10 inches by 27 feet.

Retort house, one-story brick, 207 feet by 65 feet by 21 feet.

Coal hoist, wooden frame structure, a small wooden frame building.

Concrete mixer shop, frame building, 25 feet by 16 feet by 9 feet.

Storage, tar tank building, 12 feet by 12 feet by 12 feet, wood frame, corrugated iron sides.

Oil pump house, two-story brick, 28 feet 9 inches by 18 feet 9 inches by 27 feet 3 inches.

Tar separators, foundations for tar separating system on 12 inch piles, brick walls and concrete footing.

1367 Coal shed, frame structure, 118 feet 9 inches by 69 feet 9 inches by 32 feet high.

Scale building, one-story brick, 6 feet by 6 feet by 9 feet.

Water tower, two-story circular brick building, 20 feet in diameter by 35 feet high.

Exhauster house, two-story brick building, 25 feet by 27 feet by 20 feet.

Lime shed, 104 feet by 75 feet by 14 feet.

Purifier and meter house, brick building, 132 feet 3 inches by 65 feet by 25 feet 6 inches; roof construction, iron trusses, iron purlines, slate covering.

Stable, 60 feet by 45 feet by 20 feet, brick building.

Tool shed, one-story brick, 37 feet 7 inches by 26 feet by 16 feet.

Storehouse, brick building, 24 feet by 24 feet 3 inches by 16 feet 3 inches.

Small brick building, 10 feet by 10 feet by 20 feet.

One frame shed covered with corrugated iron, 10 feet by 8 feet by 8 feet.

Blacksmith shop, frame building, 15 feet by 35 feet by 16 feet.

Pipe house, storage shed for wrought iron pipe.

Pump house, frame building, 8 feet by 6 feet by 7 feet. Tin roof.

By Mr. KIRBY:

Q. Most of the largest buildings have iron roofs, have they not?

A. Partly iron, partly wood; the generator houses and purifier houses have iron trusses, some of them; some of the purifier houses are wooden and some iron.

Brick walls, 1,179 feet of stone and brick walls, 1,100 feet of brick fence.

Shed over oil tanks; frame shed, 54 feet by 6 feet 4 inches by 5 feet 6 inches.

Foundations for salt water condenser.

Foundation for hot scrubber.

1368 Foundations for air condenser.

Brick drainage tank underground in yard between scrubber and retort houses.

Draught fan room, frame building, 12 feet by 8 feet by 8 feet.

That is all for the buildings.

Q. Will you state the total valuation of the buildings?

A. Without anything added?

Q. Yes.

A. $407,767.

Q. That deducts depreciation where you found it?

A. Yes, sir.

Q. Have you also examined and valued the apparatus and contents of the buildings?

A. I have.

Mr. MATHEWSON: We will also furnish a description of the apparatus and contents to counsel, as in the case of the other plant.

Q. Will you state what the value of the apparatus and contents is, allowing depreciation where it was found?

A. $409,175.

Q. Will you describe the yard connections and general connections which you have valued at that plant?

A. Cast-iron pipe, 4-inch to 36-inch diameter, 9,117 feet;

Steel-riveted pipe, 16 inches to 30 inches in diameter, 600 feet.

Wrought-iron pipe, 1½-inch to 12-inch diameter, 8,702 feet.

Valves:

Sixty-eight 1½-inch.
Thirty-seven 2-inch.
Thirty-six 2½-inch.
Forty-five 3-inch.

Fifty-eight 4-inch.
Ten 5-inch.
Thirty-four 6-inch.
Seven 7-inch.
1369 Eighteen 8-inch.
Four 12-inch.
Nine 16-inch.
Twelve 20-inch.
Seventy-seven 24-inch.
One 30-inch.
That is all for the connections.

Q. What is the total value of the connections?

A. $99,910.

Q. Will you now describe the holders which you valued in connection with the 44th Street plant?

A. There are four holders, 375,000 cubic feet capacity each; one holder of 2,000,000 cubic feet capacity, and two holders of 125,000 cubic feet capacity each. All of the above holders are supplied with brick tanks constructed in rock excavation.

Q. What is the value of the holders?

A. $814,929.

Q. Do these figures which you have given for building apparatus, connections and holders include the 10 per cent. for engineer and the interest in course of construction?

A. No, sir, they do not.

Q. Now, will you state what items should be added to get the total value of the plant as existing?

A. To the building apparatus and pipe connections 10 per cent., on contingencies, amounting to $91,685, and interest at 5 per cent., $50,426. To the holders, for contingencies, $81,492, and for interest charges, $44,821.

Q. Why do you say 10 per cent. for "contingencies"?

A. That goes on the total plant, holders and buildings and apparatus and pipe connections altogether for the items mentioned, engineer, drainage, storage.

Q. When you say "contingencies" you mean the engineer expenses, sewers and so forth, which you previously described?

A. Yes, I do.

1370 Q. Adding these items then, what is the total valuation of the plant to-day, building, apparatus, connections, and holders, after deducting such depreciation as you found?

A. $2,000,205.

Q. We will now take up the 21st Street plant, located between 20th and 22nd Streets, contiguous to or near the East River. Have you examined and appraised that plant as to the buildings, apparatus, connections and holders?

A. I have, sir.

Q. What gas is produced there?

A. Water and oil gas.

Q. What is the capacity of the plant?

A. Twenty-four million cubic feet of water gas per day and three and one half million cubic feet of oil gas per day.

Mr. Kirby: Did you state the capacity of the 44th Street plant?

The Witness: It is 8,500,000 feet per day of water gas.

Q. Now proceed, please, to describe the buildings at the 21st Street plant which you have appraised and valued.

A. Stove shop, one-story building, 212 feet 6 inches by 50 feet by 20 feet.

Meter shop, one-story brick building, 212 feet 6 inches by 50 feet by 20 feet.

Stove repair shop, part one-story and part two-story buildings; one-story part, 64 feet by 51 feet by 20 feet; two-story part, 20 feet 6 inches by 51 feet by 35 feet.

Stove cleaning room, 51 feet by 14 feet by 20 feet.

Diaphragm room, second story over repair shop.

Prepayment meter repair shop.

Frame shed, 98 feet by 61 feet by 15 feet.

Storage room, 20 feet by 51 feet.

Wash room, 12 feet by 51 feet.

1371 Boiler house. Brick building, 40 feet by 58 feet by 20 feet.

Oil storage house, 12 feet by 14 feet by 7 feet.

Lead house, 22 feet by 17 feet by 10 feet.

Steel frames covered with corrugated iron.

Fire hose house, 5 feet by 5 feet by 6 feet.

Frame building covered with sheathing and tin.

Valve house, 21 feet 9 inches by 28 feet by 11 feet; brick building.

Octagonal valve house, brick building, 10 feet 3 inches between parallel sides; 25 feet high.

Another valve house, brick building, 15 feet 6 inches by 10 feet by 12 feet.

Tinsmith's shop, 26 feet by 28 feet by 25 feet.

Storeroom, triangular in shape, a brick building.

Paint shop, duplicate of storeroom.

Office, 47 feet 4 inches by 51 feet by 26 feet 6 inches high.

Engine room, 150 feet by 74 feet and 46 feet by 44 feet, both 25 feet high.

Engine room, 130 feet by 52 feet by 25 feet high.

Machine shop, 26 feet by 52 feet.

Old retort house, 306 feet by 54 feet by 23 feet.

New shop building, 47 feet by 57 feet by 15 feet.

Old carbureter house, 38 feet square.

Generator house, 204 feet by 50 feet by 30 feet.

Building over boiler and coke storage, 307 feet 3 inches by 68 feet by 25 feet high.

Generator house, 204 feet by 74 feet by 30 feet.

Retort house, 307 feet 3 inches by 74 feet by 25 feet.

Pump house, two-story brick, 20 feet by 38 feet by 29 feet 4 inches.

No. 1 shed, 185 feet 6 inches by 66 feet by 28 feet 6 inches.

Numbers 2, 3, 4 and 5 sheds, same as No. 1 shed.

Purifier house, 185 feet 6 inches by 66 feet by 44 feet high.

1372 Condenser house, 185 feet 6 inches by 66 feet by 44 feet high.

Purifier house, 185 feet 6 inches by 66 feet by 44 feet high.

Meter house, one-story brick, 92 feet by 72 feet by 28 feet high.

Shaving scrubber house, 185 feet 6 inches by 66 feet by 35 feet high.

Exhauster house, two-story brick, 64 feet 4 inches by 49 feet 10 inches by 41 feet 3½ inches high.

Coal shed, 150 feet by 68 feet by 34 feet high.

Water tower, circular brick building, 20 feet diameter, 225 feet high.

Excavation and foundations for 12 oil tanks underground.

Excavation for 10 separating tanks located underground.

One new foundation for additional oil tank 57 feet in diameter by 30 feet high.

One foundation for steel tank, 16 feet by 50 feet by 2 feet 4 inches deep. That is all.

Q. What is the total valuation of the buildings described, depreciation deducted where you found it?

A. $1,579,695.

Q. Did you give the capacity of this plant?

A. I did.

Q. Have you also examined and appraised the apparatus and contents there?

A. I have.

Mr. MATHEWSON: We will furnish counsel a description of those.

Q. Without asking you to repeat those in detail on the record, what is the total value of the apparatus and contents, depreciation deducted?

A. $1,139,677.

Q. Will you now describe the yard connections?

1373 A. It is not yard connections, it is the whole connections throughout the entire plant.

Q. I will change my question to the connections throughout the plant.

Mr. KIRBY: I presume that applies in all instances where you have used the term yard connections, you mean yard connections and internal connections?

The WITNESS: Yes, all connections to the appliances in the plant.

Q. You may proceed to describe the connections at 21st Street.

A. —.

Cast iron pipe 8-inch to 36-inch diameter, 6,624 feet.

Steel riveted pipe, 16-inch to 36-inch in diameter, 4,772 feet.

Wrought iron pipes, 1½-inch to 12-inch in diameter, 1,550 feet.

Valves:

Sixteen 12-inch.
Five 16-inch.
One 18-inch.

Eighteen 20-inch.
Forty-eight 24-inch.
One hundred and thirteen 30-inch.
Twenty-seven 36-inch.
Twelve 36 regulator valves.
That is all for that.

Q. What is your valuation for that item?

A. $218,201.

Q. Will you describe the holders which you valued at or in connection with this 21st Street plant?

A. There are four holders, 400,000 cubic feet capacity. One holder 1,500,000 cubic feet capacity. Those five holders are in brick tanks.

1374 Q. Is that all?

A. Yes, sir. Those are all brick holder tanks.

Q. Just go on with the other holders?

A. Do you want them altogether? We separate them in the office.

Q. All right, what is the value of the holders which you have named?

A. $561,840.

Q. Now, go on with the steel holders?

A. One holder 149,500 cubic feet capacity, and one holder 280,000 cubic feet capacity; they are steel tanks constructed upon concrete foundations on piles.

Q. What is the value of those holders?

A. $104,070.

Q. And the total for all the holders?

A. $665,910.

Q. What other items enter into the total value of the plant?

A. Ten per cent. to the buildings, apparatus and pipe connections, amounting to $292,293, and interest charges of 5 per cent., amounting to $293,757, making a total for plant without holders of $3,392,895. To the value of holders must be added a charge of 10 per cent., amounting to $66,591, and an interest charge of 5 per cent., amounting to $36,625, making the total value of all holders, $769,126.

Q. And the total value of the plant to-day, allowing depreciation, is how much?

A. $4,162,021.

Q. What is the next plant conveniently in order? Is it the 99th Street plant?

A. Yes.

Q. Have you examined and appraised the buildings, apparatus, connections and holders at the 99th Street plant or connected with it?

A. I have.

Q. What is the capacity of the 99th Street plant?

A. 5,500,000 cubic feet in twenty-four hours.

Q. Of what kind of gas?

A. That is water gas.

Q. Will you describe the buildings at that plant as you have done in the case of the other plants?

A. Engine and boiler house and pump house, machine 1375 shop, retort house and accumulator house, five houses under one roof; 271 feet 3 inches by 57 feet 5 inches by 28 feet brick building.

Generator house, two-story brick building, 69 feet by 67 feet 4 inches by 24 feet 6 inches.

Foundations for one air condenser.

Foundations for salt water condenser.

Office building, two-story brick, 42 feet by 30 feet 8 inches by 30 feet 6 inches.

Meter house, one-story brick, 52 feet by 39 feet by 27 feet.

Purifier house, one-story brick, 124 feet by 61 feet 6 inches by 30 feet.

Lime house, one-story brick, 75 feet by 15 feet 9 inches by 18 feet.

Valve house, frame shed, 10 feet by 12 feet by 10 feet.

Valve house, octagonal frame building, 8 feet between parallel sides.

Three additional valve houses, of same dimensions and description as above.

Condenser house, one-story brick, 52 feet by 39 feet by 27 feet.

Exhauster house, one-story brick building, 42 feet 8 inches by 27 feet by 25 feet.

Tar separator system.

Foundations for same.

Foundation for tar storage.

Pump pit, 23 feet by 13 feet 8 inches by 10 feet deep, of concrete.

Coal shed, one-story brick, 125 feet by 46 feet by 18 feet.

Filter press house, one-story frame, 13 feet by 20 feet by 7 seven.

Brick walls, 663 feet of wall, average height 10 feet 12 inches thick.

Timber fences, dressed lumber, 9 feet high.

I have not got the number of feet for that.

Cover over domes of oil tanks.

1376 Frame building, 7 feet 6 inches by 125 feet by 6 feet.

Foundation under hot scrubbers of concrete and steel beams.

Q. What is the value of these buildings you have described, depreciation out?

A. $248,247.

Q. Have you also appraised the apparatus and contents?

A. Yes, sir.

Mr. MATHEWSON: We will also furnish a description of these items to counsel.

Q. Without enumerating the different items on the record will you state what the value of the apparatus and contents is as you found it, deducting the depreciation?

A. $268,177.

Q. Are there any connections at that plant?

A. Yes, sir.

Q. Will you describe them, please?

A. Cast iron pipes 4 inches to 36 inches in diameter, 5,861 feet.
Steel riveted pipes, 30 inches in diameter, 339 feet.
Wrought iron pipe, 1½ to 10 inches in diameter 5,552 feet.

Valves:

Four 3-inch.
Four 4-inch.
Twenty-four 3-inch.
Twenty-five 4-inch.
Thirteen 6-inch.
Ten 8-inch.
Ten 10-inch.
Two 12-inch.
Eighteen 16-inch.
Sixteen 20-inch.
Thirty 24-inch.
One 30-inch.

That is all.

1377 Q. What is the value of these connections?

A. $55,248.

Q. Will you describe the holders which you examined and appraised at or in connection with this 99th Street plant?

A. Yes, sir. Two holders 600,000 cubic feet capacity each; one holder of 300,000 cubic feet capacity; one holder 100,000 cubic feet capacity. All of the above holders are supplied with brick tanks and constructed upon a pile foundation.

Q. What is the valuation of those holders allowing depreciation where it has occurred?

A. $262,106.

Q. Are there other items to be added to obtain the full valuation less depreciation of this plant?

A. Yes, sir.

Q. Will you state what they are?

A. To the buildings, apparatus and pipe connections 10 per cent., amounting to $57,167.

Q. For what?

A. 10 per cent. for general contingencies.

Q. Engineering and so forth?

A. Engineering and so forth, yes sir. And an interest charge of 5 per cent. amounting to $31,441, making a total for buildings, apparatus and connections of $660,280. To the holders will have to be added for general engineering and so forth 10 per cent., amounting to $26,210, and an interest charge of 5 per cent., amounting to $14,415, making a total for holders of $302,731.

Q. Now what is the total value of the plant including buildings, apparatus, connections and holders to-day after deducting depreciation where it is found?

A. $963,011.

Q. Have you also examined and appraised the 18th Street plant of the Company?

A. Yes, sir.

Q. Near the North River?

A. I have.

1378 Q. A portion of that plant has been condemned by the city, has it not, Mr. Mayer?

A. Yes, sir.

Q. Will you first describe the portion of it which is still in the possession of the company and has not been condemned, if you have that separately?

A. Well, I have that now, separated entirely.

Q. Very good. What was the capacity of the plant and what kind of gas?

A. The original capacity was three million feet.

Q. Three million five hundred thousand feet, wasn't it?

A. Three million five hundred thousand feet, yes, sir.

Q. Coal gas?

A. Coal gas.

Q. Will you now describe the buildings which have not been taken by the city?

A. —.

Five small frame sheds in holder yard.

Engine and exhauster house, one-story brick building 36 feet 6 inches by 19 feet by 15 feet 6 inches, all 30 feet high.

Valve house, one-story brick building, 19 feet by 22 feet by 20 feet.

Boiler house, one-story brick building, 46 feet 2½ inches by 14 feet by 14 feet 3 inches.

One wagon shed, 21 by 28 by 15 feet of timber covered with corrugated iron.

One gas holder building of brick, 188 feet by 92 feet by 47 feet high.

Wood fences.

Coal storage yard between 18th and 19th Streets, 520 feet, about 9 feet high.

Coal storage yard between 17th and 18th Streets, 720 feet, about 9 feet high.

One brick wall across end of storage yard 12 inches thick, 180 feet.

One timber coal hoisting trestle complete in holder yard, between 18th and 19th Street.

600 feet of brick retaining wall, 12 inches thick, about 9 feet above grade.

1379 Q. Is that all the structures?

A. That is all for the buildings.

Q. What is the value of those buildings which you have described after allowing for depreciation?

A. $182,901.

Q. Have you also examined and appraised the apparatus and contents of the building?

A. Yes, sir.

Mr. Mathewson: We will also furnish a description of those items to counsel.

Q. Without enumerating the different items on the record, will you state what the value of the apparatus and contents is as you find it, deducting the depreciation?

A. $14,019.

Q. Are there any connections at that plant?

A. There are.

Q. Describe them, please?

A. Cast iron pipes 20 inches in diameter, 1,890 feet.

Wrought iron connections, 1 to 3 inches in diameter, 360 feet.

Valves.

Eight 1-inch.
Three 2-inch.
Four 16-inch.
Twenty-six 24-inch.

Q. What is the total value of those connections?

A. $21,987.

Q. Have you also examined and valued the holders?

A. Yes.

Q. Please describe them and give their value?

A. Two holders each of 205,000 cubic feet capacity, and four holders each of 255,000 cubic feet capacity. Each of above holders is supplied with a brick tank constructed on pile foundations.

Q. What is the value of them?

A. $290,943.

1380 Q. Are the items you have given outside of the 10 per cent. engineering and 5 per cent. interest?

A. They are.

Q. Will you now state what additions there are, if any?

A. There is an addition for buildings, apparatus and pipe connections, 10 per cent. for engineering charges, &c., amounting to $21,890, and an interest charge of 5 per cent., amounting to $12,039, making a total for building apparatus and pipe connections complete, $252,836.

Q. Now, about the holders?

A. There is an additional charge of 10 per cent. for general engineering to the holders, amounting to $29,094, and an interest charge of 5 per cent., amounting to $16,000, making a total for holders of $336,037.

Q. Taking then what is the present value, allowing the depreciation where it has occurred and leaving out that portion which has been condemned by the city, including building apparatus and connections and holders, what is the value?

A. $588,873.

Q. Now, will you state what has been condemned by the city and give your valuation of the plant at 18th Street?

A. The way I arrived at the value of the original plant was by applying a unit figure of $340 per thousand cubic feet capacity of works, which price does not include any holders. The unit figure of $340 was ascertained by comparison with the 14th Street and 42nd Street coal gas works.

Q. The 18th Street manufacturing plant was a coal gas plant?

A. Yes; the total value of the plant thus established is $1,190,000.

Q. Of the manufacturing plant?

A. Yes; to this value must be added the holders, consisting first of those already referred to in the 18th Street plant, amounting to $336,037. Then the holders in addition to those mentioned which were contained in the original plant, consisting of four 250,000 feet holders, each in brick tanks on pile foundations, and one 1381 3,000,000 feet holder and steel tank with concrete and tile foundation. The four brick tank holders represent the total value of $223,590, and the 3,000,000 feet holder with steel tank, $347,281, making the value of the entire plant in the original condition, $2,096,908. From this figure should be deducted the value of the remaining portion of the 18th Street plant, amounting to $588,873, leaving the balance $1,508,035.

Q. You know that the 14th Street plant and the 18th Street plant were the property of the same company when the consolidation took place in 1884, do you?

A. Yes.

Q. Did you observe, as far as you were able to observe, any difference in the character of the plant so far as the cost of plant was concerned. You say you took the same figures?

A. It was practically the same plant as 14th Street.

Q. And you took the figures you found as unit values at 14th Street and 42d Street, which are coal gas plants, and applied them to the 18th Street plant so far as it had been condemned by the city?

A. I did.

Q. And it was open to your inspection?

A. No, it was not there; of course not.

Q. And you took this unit value and considered the capacity of the works and assumed that the works were of the same general character as the 14th Street and 42d Street works?

A. No, sir, I did not assume it was of the same character; I know that from my own knowledge.

Q. You knew that from your own knowledge?

A. Yes.

Q. In other words, you had seen the plant?

A. Many times.

Q. You had seen it many times before it was condemned?

A. Yes, many times.

1382 Q. So that you were entirely familiar with the character of the plant?

A. Absolutely.

Q. And do you feel confident that your estimate of $2,096,908 is a fair estimate, from your knowledge of the plant as it originally existed?

A. I am satisfied that it was a low value, because the value was based upon the estimated values of the 14th Street plant, and in the instance of the 18th Street plant the figure could have been proportionately higher on account of better facilities for handling coal, which are not included in the 14th Street plant. These facilities consisted of iron coal bunkers supported, alongside of the retort house, upon iron columns, which is not the case in the instance of the 14th Street plant.

Q. This $2,096,908 includes, I assume, 10 per cent. for engineering expenses and 5 per cent. interest, in the same manner as similar items computed at 14th Street and 42d Street?

A. Yes.

Q. This completes, does it not, all the manufacturing plants of the Consolidated Gas Company? That is to say, where either coal or water gas has been manufactured?

A. Yes, it does.

Q. Are there in addition certain distributing holder plants or stations which you have examined and appraised?

A. Yes, there are five.

Q. Will you state what they are?

A. The 63d Street holder station, the 65th Street station, the 111th Street holder station, the 132d Street holder station, and the so-called Inwood station.

Q. Take the 63d Street station. Will you describe any buildings which there are there?

A. Do you want me to describe the buildings?

Q. Yes.

A. Engine room, frame building, 24 feet by 28 feet by 10 feet; valve house, frame building, 16 feet by 30 feet by 10 feet 6 inches; boiler house, 17 feet by 30 feet by 15 feet 6 inches. Brick 1383 fence walls, 440 feet, 10 feet above grade, 5 feet 6 inches below grade; that is all.

Q. What is the value of those buildings, depreciation deducted?

A. $11,429.

Q. What apparatus is there there? There is not much apparatus described, is there?

A. There is not many in this instance.

Q. State what apparatus is there.

A. In the engine room:

One 30-horsepower Morris engine, horizontal reversible.

One Sturtevant exhauster, steam and exhaust connections, countershafts and pulleys, gauges and connections.

In the valve house, one photometer.

In the boiler house:

One 66 feet by 16 feet Continental Iron Works boiler.

One Simplex Blake's pump, 6 inches by 10 inches.

One Metropolitan injector, pressure gauges, pipe connections and firing tools.

In the yards:

One Duplex pump, 10 feet by 6 feet; one drip water tank with two-inch pipe connections. That is all for that.

Q. What is the value of that apparatus, allowing for depreciation?

A. $4,828.

Q. Will you describe the connections there?

A. Yes, cast-iron connections 24 inches to 30 inches diameter, 225 feet; wrought iron connections, 1½ inches to 2 inches diameter, 80 feet; valves, two 24 inches and four 30 inches.

Q. What is the total valuation of such connections?

A. $7,887.

Q. Now describe the holders there.

A. One 3-million feet holder, one retaining wall 200 feet long, one brick tank for above holder, constructed in rock excavation. That is all.

1384 Q. What is the value of those holders?

A. $420,367.

Q. Does this include any allowance for engineering and interest?

A. No, sir, it does not.

Q. Please add those items and state what the totals are?

A. For general engineering I have only made a charge in the instance of holder stations of five per cent. instead of ten per cent., for the reason that I could not have overlooked as many items and omitted them from the schedule that I put in the plant, this being a very much simpler matter to examine.

Q. All the rest that you are about to describe are holder stations, including this 63d Street station?

A. On the same basis, five per cent. for general engineering and five per cent. for interest charges; the five per cent. for engineering amounts to $1,207 and the five per cent. for interest $1,267. That is on the station without the holders, making total value $26,618.

Q. For everything exclusive of holders?

A. Yes, five per cent. for engineering charges on the holders amounts to $21,018, and the five per cent. interest charges, $22,069.

Q. Making a total for holders of what?

A. $463,454.

Q. What is the total value to-day of the buildings, apparatus, connections and holders at the 63d Street station after deducting depreciation where you have found it?

A. $490,072.

Q. Take the 65th Street station and describe the buildings there.

A. Engine house, frame building, 20 by 38 by 20.

Exhauster house, two-story brick building, 37 by 42 by 45.

Boiler house, one-story brick building, 24 by 32 by 21.

Boiler house extension, one-story brick building, 16 by 20 by 16.

1385 Brick walls, 2,164 feet, averaging about 12 feet at different heights. I have the detail as to each height.

Q. The total value of the buildings and structures which you have enumerated at the 65th Street station is what?

A. $51,183.

Q. Will you describe the apparatus which you have appraised there?

A. Yes.

In the engine house, one beam engine, 6 inches by 18 inches.

In the exhauster house, one 12 by 12 Rowland vertical engine with steam and exhaust piping.

One 30-inch Mackenzie exhauster, gauges and connections, engine shafting and belts.

One photometer; furniture and plumbing.

In the boiler house, two horizontal tubular boilers 48 inches by 10 feet.

One horizontal tubular boiler 48 inches by 12 feet.

The above boilers are on brick settings.

One No. 2 Niagara feed pump 4 inches by 2½ inches by 7 inches.

One No. 4 Korting injector.

One steel stack, with connections to boilers.

In boiler house extension:

One 66 by 14 horizontal tubular inside fire box boiler and

One No. 5 Korting injector.

Q. What is the valuation of such apparatus and contents?

A. $10,159.

Q. Now, will you describe the connections at the 65th Street plant?

A. Cast iron pipes, 16 inches to 30 inches in diameter, 750 feet; and 260 feet of average 24-inch pipe.

Wrought iron pipe connection, 500 feet of 2-inch and less in diamater.

Valves, 23 30-inch and 4 16-inch.

Q. What are the value of such connections?

A. $20,406.

Q. Will you describe the holders at that station?

1386 A. Two holders, each 325,000 feet capacity; four holders of same capacity; two holders, each four million feet capacity. All of the above holders are constructed in brick tanks.

Q. What is the value of those holders?

A. $1,212,873.

Q. Does this include an engineer allowance and interest allowance in course of construction?

A. No, sir.

Q. Please state what, if anything, should be added on that account to get the full value?

A. There should be added to the buildings, apparatus and pipe connections, for engineering charges, 5 per cent., amounting to $4,087, and interest charges of 5 per cent., amounting to $4,291 making a total of $90,126, which is exclusive of holders. Now, to the holders there should be added for engineering charges 5 per cent., or $60,643, and for interest charges $63,675, making a total for holders of $1,337,191.

Q. What is the total value of the plant at 65th Street, including buildings, apparatus, connections and holders, and allowing depreciation which has been observed?

A. $1,427,317.

Q. Now, take the next one.

A. 111th Street?

Q. Take now the 111th Street station and describe the buildings there.

A. Office, two-story brick, 50 feet by 25 feet by 31 feet 6 inches.

Exhauster house, one-story brick, 66 feet by 54 feet by 27 feet 4 inches.

Boiler house, 44 feet 3 inches by 32 feet 3 inches by 18 feet.

One-story steel frame building covered with corrugated sides and roof.

Hoisting engine house, frame shed, 13 feet by 18 feet by 7 feet.

Scale house, plain work building, 12 feet by 15 feet by 13 feet.

1387 Stable, brick building with basement, 75 feet by 32 feet by 25 feet.

Coal storage; area, 67 feet by 52 feet.

Generator house, one-story brick, 72 feet by 48 feet by 27 feet.

Tool shed, frame building, 48 feet, 6 inches by 65 feet by 9 feet.

Retort house, brick, 200 feet by 52 feet by 22 feet.

Foundations for oil tank, 43 feet diameter, 11 feet high, of brick, 12 feet thick.

Blacksmith shop, brick, 26 feet by 34 feet by 19 feet.

Fences. Stable yard 270 feet of wooden fence 8 feet high.

Fence around holders 1,140 feet, 8 feet high.

Around works, 1000 feet, 8 feet high.

Brick wall on First Avenue, 56 feet by 8 feet high. That is all for the buildings.

Q. What is the value of the buildings without engineer or interest charges?

A. $107,981.

Q. Will you describe the apparatus and contents of what you have valued at the 111th Street station?

A. In the office building, office furniture consisting of desks, chairs, safes and wall maps, cupboards, letter presses, bath and toilet, steam radiators and gas fixtures. In the exhauster house, 42 valve stands for 36-inch and 24-inch valves; tool No. 11; 118 cubic, etc., 11,118 cubic feet, vertical Root's exhausters; two 16-inch by 16-inch Payne reversible link motion engines, 100 horsepower each direct connected to the exhausters.

Two 36-inch Connelly gas governors.

One Cochran feed water meter.

Steam exhaust and *guage* piping and gauges.

Plumbing and piping to steam heating radiators and piping.

One photometer.

Four closets.
1388 One toilet.
One wash basin.

Boiler house.

One steel stack; 4 feet in diameter, 64 feet 8 inches high.

Bridging for above stack.

Three boilers 66 inches by 16 feet, horizontal return tubular, 90 tubes each boiler, 3 inches diameter, 16 feet long, brick setting, ornamental cast iron fronts.

One Knowles pump 6 inches by 4 inches by 7 inches.

Beam and water piping for same.

One 1½-inch Hancock inspirator.

In the hoisting and engine house:

One Lidgerwood hoisting engine, double cylinder, 8¼ inches by 10 inches.

Scale house:

One 10-ton Fairbanks wagon scale.

Stable:

Stable fittings and appliances, thirty-two stalls and feed racks.

Tool shed:

Four old beam engines; lockers.
One lathe and tool bins.

In the retort house:

One stack of sixteen benches of six retorts each, length of retorts, 20 feet.

One stack of five benches of five retorts each; retorts 20 feet long.

In the blacksmith shop:

Forge and tools.

In the yard:

One oil tank; 43-inch diameter, 20 feet deep, of ¼-inch plates.

One atmosphere condenser of cast-iron pipe, 20 feet in diameter, in ten sections, with cast-iron bases and return bends at top, 18-inch connections.

1389 Q. What is your valuation of this apparatus which you have just enumerated?

A. $103,446.

Q. Will you describe the connections at the 111th Street station?

A. Cast-iron pipe, 24 inches to 36 inches, 550 feet; wrought-iron pipe, 1½ inches to 4 inches, 760 feet.

Valves:

Forty-one of 36-inch diameter, and one of 24-inch diameter.

Q. What is the value of such connections?

A. $27,068.

Q. Will you describe the holders at the 111th Street station?

A. Two holders, each 5,000,000 cubic feet capacity, with concrete foundations and retaining walls around lower portion of tank.

Q. What is the value of those holders without interest or engineer?

A. $704,737.

Q. Are there any items to be added to procure the full value?

A. Yes, sir. There are charges for general engineer, 5 per cent., to be added to the buildings, apparatus and pipe connections, amounting to $11,924, and for interest charges a similar amount of 5 per cent., $12,520, making the total for the buildings, apparatus and pipe connections $262,939. To the holders there is to be added for general engineer charges 5 per cent., amounting to $35,236, and interest charges of 5 per cent., amounting to $36,998, making a total of $776,971.

Q. What then is the total value of the plant at 111th Street, buildings, appar-tus, connections and holders, after deducting any depreciation which you found?

A. The total for buildings, apparatus and pipe connections is $1,039,910.

Q. We will take now the 132d Street station. Will you describe the buildings there which you have valued?

A. One governor and boiler house, brick building, 100 feet by 49 feet by 29 feet.

1390 One stack for boilers, 125 feet high, 5 feet 6 inches and 6 feet 9 inches diameter.

Q. What is the value of those buildings?

A. $29,776.

Q. Without engineering charges or interest?

A. Yes.

Q. Will you now state the apparatus and contents at 132d Street which you valued. Is that long?

A. No.

One No. 11½-inch vertical exhaust, 122 cubic feet capacity with flexible coupling.

One 16½-inch by 24-inch horizontal Buckeye engine with reversing gear and outboard bearings, 150 horse-power.

One 24-inch Connelly gas governor.

Three B. & W. boilers, set in two batteries, each with 80 tubes, 4-inch diameter by 16 feet long.

One 6-inch by 4-inch Knowles duplex plunger pump.

One No. 6 Cochrane feed water heater.

One No. 10 steel plate breaching.

One 3-inch Crown water meter.

One No. 12 Metropolitan injector.

One blow-off tank, 3 feet diameter, 10 feet long.

One 8-inch Hudson exhaust head and steam exhaust, water and gauge piping in gauges.

One toilet wash basin and miscellaneous plumbing.

Q. What is your valuation upon this apparatus at 132d Street?

A. $18,979.

Q. Will you describe the connections at 132nd Street?

A. Cast-iron connections, 20-inch to 36-inch pipe, 2,400 feet.

Valves:

Nine 36-inch.
Seven 30-inch.
Six 24-inch.
Four 20-inch.

1391 Q. What is the value of the connections which you have just enumerated?

A. $47,714.

Q. Please describe the holders at 132nd Street.

A. One holder, 5,000,000 cubic feet capacity, on a concrete foundation with concrete retaining wall.

Q. What is the value of this holder and the structures in connection with it which you have mentioned?

A. $393,965.

Q. Do these figures at 132nd Street represent the real value of the property, or are the engineering and interest charges still to be added?

A. Yes, sir, such charges have to be added.

Q. Please state what the additions are.

A. The additions to the buildings, apparatus, and pipe connections for engineering charges are 5 per cent., amounting to $4,823, and for interest charges are 5 per cent., amounting to $5,064, making a total for buildings, apparatus and pipe connections of $106,356. For the holders, similar charges; for engineering, 5 per cent., amounting to $19,698, and for interest charges, 5 per cent., amounting to $20,683, making a total for holders and foundations of $434,346.

Q. What, then, is the total value of the plant at 132nd Street, including buildings, apparatus, connections and holders, deducting such depreciation as you have observed, if any?

A. $540,702.

Q. Will you now take up the Inwood station and say what buildings are there which you have valued?

A. Exhauster house in connection with dwelling, one-story building, 22 feet by 24 feet and 11 feet 4 inches and 24 feet high. Part of that was two stories.

Q. What is your valuation for those buildings, allowing any depreciation?

A. $3,230.

Q. Will you describe the apparatus at Inwood which you have valued?

1392 A. One six-inch Makenzie exhauster, six-inch connections, with countershafting.

One Smith & Sayre vertical engine, diameter of cylinder 4 inches, stroke, 6 inches.

One 12-inch governor.

One upright tubular boiler, 3 feet diameter by 6 feet high, containing 52 tubes, 1½ inches diameter.

Steam connections, pipe and steam fittings, steam and gas pressure gauges.

One Cameron pump, 3 inches by 5 inches.

Q. What is the valuation of this apparatus, exclusive of engineering and interest?

A. $1,640.

Q. Will you describe the connections at that station?

A. Cast-iron pipes 6 inches to 12 inches, 170 feet.

Wrought iron pipe 1-inch to 2-inch in diameter, 80 feet.

Valves, six 6-inch, four 12-inch.

Q. What is your valuation for such connections?

A. $923.

Q. Will you describe the holders at the Inwood station?

A. One holder 60,000 cubic feet capacity with brick tank.

Q. What is the value of this holder?

A. $17,948.

Q. Must any charges for engineering and interest be added to obtain the full value of this property at Inwood?

A. Yes, sir. Engineering charges amounting to 5 per cent. to be added to the buildings, apparatus and pipe connections would be $289; for interest charges at 5 per cent. $304, for the property at Inwood, exclusive of holders, making a total of $6,386. For the holder there would have to be added an engineering charge of 5 per cent., amounting to $897, and an interest charge of $942, making the total for the holder of $19,787.

Q. What is the total value of the Inwood station, including
1393 buildings, apparatus, connections and holders, allowing for
any depreciation which has taken place?

A. $26,173.

Q. What is the total valuation covering all plants and stations respecting which you have testified, for buildings, apparatus, connections and holders, allowing depreciation out wherever it has occurred?

A. $17,040,524. This includes the 18th Street station in its original condition before a part of it was condemned by the city.

Q. Will you now state what such total valuation is, excluding that portion of the 18th Street plant which has been taken by the city and including that portion of the 18th Street station which still remains in the Consolidated Gas Company?

A. $15,532,489.

Q. In your testimony to-day you have first given figures for buildings, apparatus, connections and holders, not including any charge for engineering expense or interest?

A. Yes, sir.

Q. And I understand that such figures are not the real value of the buildings, apparatus, connections and holders respectively, but are merely preliminary figures to which must be added in each case the engineering charge and interest charge in order to get the full and actual value to which you have subsequently testified?

A. Yes, sir.

Q. So that when you or counsel have used the term "value" in referring to these preliminary figures, before addition of any engineering expense or interest, we are to understand that such figures do not in your judgment represent the actual value of the property, until engineering expense and interest have been added thereto?

A. That is right, yes, sir.

Q. And do I understand that in each case the final values to which you have testified are values obtained after deduction of any depreciation which has occurred?

A. Yes, sir.

1394 Q. You examined the property for depreciation in making your appraisal, did you not?

A. Yes, sir.

Q. And where you have spoken of buildings, or holders, or other property, you have included the usual appurtenances as you found them?

A. Yes, sir.

Adjourned to 1:30 P. M., Wednesday, August 29th, 1906.

Last Exhibits:

Complainant's 233.
State's N.
City's 34.

1395 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

Met pursuant to adjournment.

NEW YORK, WEDNESDAY, *August* 29, 1906—1.30 p. m.

Present: The Master, Mr. Mathewson, Mr. Meade, Mr. Page, Mr. Burr, Mr. Kirby.

1396 MR. MATHEWSON: I have a correction to make in Mr. Preiss's testimony. On page 1314 the total, $14,378,516, should be $14,305,916.

FREDERICK J. MAYER resumed.

The MASTER: You have finished your direct examination?
Mr. MATHEWSON: Yes.

Cross-examination by Mr. PAGE:

Q. Mr. Mayer, you state that in making the appraisal, and examination and valuation of this plant that you worked for six weeks day and night and Sundays and had twelve people helping you?

A. Yes, sir.

Q. I suppose that you measured the buildings yourself or had someone do it?

A. Well, my men did, yes, sir.

Q. In this time was included the time necessary to make the measurements of the various buildings?

A. Yes, sir.

Q. And as to the plant, you went through the plant and made a list yourself of the different things that were there?

A. No, my men made the list under my supervision.

Q. I mean, when I say you, I refer, of course, to the work that was done in this six weeks' time.

A. Yes.

Q. After the measurements were made and the list was prepared how long did it take you then to make the appraisal?

A. Why, I started on that from the first day; as soon as a section of the plant was finished it was sent to my office and I worked on the figures during the time the measurements for the balance of the plant were being made.

Q. Did you make any examination of the plant yourself?

A. Yes, sir, several of them.

1397 Q. Did you examine each plant to ascertain its condition?

A. Yes, sir, as near as I could.

Q. Did you make any inquiry as to how old the various apparatus and buildings examined by you were?

A. I did, yes, sir.

Q. Did you have any information as to the original cost of the buildings or apparatus?

A. I did not.

Q. In your appraisal, then, you based your estimate upon the prices of to-day?

A. I did, sir.

Q. Was it your object in making this examination to ascertain what a plant would cost to-day that would produce the results that these plants did?

A. Yes.

Q. And it was not, then, the valuation of this particular plant as it exists to-day?

A. Yes, it was a valuation of the plant.

Q. I understood you to say that you took as your method of valuation what it would cost to produce a plant to-day that would produce the results that this plant produces.

A. That is right, less the depreciation.

Q. And it is not a valuation of this particular apparatus with a view of what it originally cost, less depreciation?

A. No, sir.

Q. Then your appraisal was not of this plant, but it was an appraisal of a supposed plant that could be produced to-day, and some element of depreciation figured off from that?

A. Well, the same plant produced to-day, less depreciation.

Q. A good deal of this apparatus has been in use for a good many years, hasn't it?

A. Yes, sir.

Q. When was the 14th Street plant which you testified to yesterday built, if you know?

A. In the '50's; some parts as far back as 1853.

Q. What part of it was built in 1853?

A. The retort house.

1398 Q. Did you have placed before you the inventory of this property that was made in 1884?

A. No, sir.

Q. Now, how did you arrive at the value of the buildings?

A. Well, I have constructed a great many gas works, and knew the cost of all those works I constructed. The latest built work that I constructed in this neighborhood was the works of the Kings County Gas and Illuminating Company in Brooklyn; that works was constructed in 1899. The class and character of buildings are very similar to the buildings of these various works, plain brick work with 4-inch projecting pilasters and ordinary coping at the top of the walls and wooden and iron roofs such as are generally used in gas works construction.

Q. What was the capacity of that plant?

A. That was a coal gas plant of a million and a half capacity; that is, originally a million and a half, laid out for three million; all the mains and principal details were arranged for three million, so it could be extended to that capacity.

Q. Now, did you base your cost on that as a three million capacity plant or one million and a half?

A. No, sir, I took each building by itself and ascertained the cost of such building per cubic foot of contents, figured from the basement line to the eaves of the roof; those were my unit factors applied in the other buildings of the various gas works now under consideration.

Q. You did not measure the walls and compute the number of bricks that would be in those walls?

A. No, sir.

Q. And the price of brick laid?

A. No, sir.

Q. I understand you assumed the Kings County works, to which you have referred, as a standard of cost?

A. I did not assume that. I knew that. That is a fact.
1399 The thickness of walls compares with the thickness of the
walls of these buildings. They are practically the same.

Q. Well, I say you took that works as a standard, and using that as a standard, by the necessary multiplication produced the result that you have testified to here in regard to buildings?

A. Yes, sir.

Q. Now, what do you mean by per cubic contents?

A. Well, it is merely a factor that is easily applied; almost any other factor could be adopted, such as square feet of surface.

Q. Did you ascertain what was the cubic contents of the buildings —is that what you mean?

A. Yes, sir, I did.

Q. A building enclosed by walls of a certain dimension?

A. Yes.

Q. And what is the cubic air space within that building?

A. Yes.

Q. And what did you divide that by to get your standard after you had got your cubic contents?

A. I divided the price by the number of cubic feet, and that was the price per cubic foot.

Q. That would be the correct standard, would it not, if you were building up a solid building of that cubic contents, but where you are enclosing a space in walls, does that give you the proper standard?

A. Yes, sir, of course; because the buildings from which I figure my value were hollow buildings; they were not solid buildings.

Q. Then, as I understand you, if the building of the Kings County works was fifty feet long on each side and twenty-five feet wide and, say, twenty-three feet high, you would get the cubic contents of that building?

A. Yes, sir.

Q. If the building at 14th Street was twice that length and the same width and the same height, then you would multiply that by two; is that right?

A. If it was twice the length?

Q. Yes.

A. Yes.

1400 Q. You would multiply it by two?

A. Yes, sir, if it was twice the length and the same width.

Q. And the same height?

A. And the same height, yes, sir.

Q. And you would take that as the cost then to be doubled?

A. Yes.

Q. Now, I call your attention to the fact, then, that you would be doubling the end walls of the building, would you not?

A. Well, there would be two end walls and a partition wall.

Q. No, not necessarily a partition wall. Why, a partition wall?

A. Didn't you say a building of twice the size? You mean one continuous building without any partition?

Q. Yes.

A. Then the price would be slightly reduced.

Q. Then you would not assume the standard that you have just testified you would, you would not double the cost of that building?

A. Well, it would be double, less a small omission for that brick in the partition wall.

Q. Well, would a wall twenty-five feet long and twenty-three feet high be a small deduction?

A. In that size building, yes.

Q. In that size building?

A. Yes.

Q. It is one-half the distance on one side of the first supposed building and a quarter the size of the entire side of the second supposed building, and if you doubled the two end walls you have got the size of the side wall on one building and half the side wall on the other. Do you consider that a small deduction?

A. The side walls would be absolutely twice the length of the other building and the gable walls would remain the same.

Q. But your side wall on the first building would be half the length of your gable wall and in the second building it would be a quarter the length of the gable wall, or if you doubled the two gable walls it would be only half the length of the two gable walls? 1401

A. I cannot follow you. If you double the building the side walls are twice as long.

Q. If you sat down to estimate and bid on a plant would you figure in that way?

A. For an approximate figure I would, yes, sir.

Q. I am not speaking about approximate figures because I judge when you bid on a plant you do not make an approximation. If you were going to make figures to put in a bid to the Consolidated Gas Company for building a building, is that the way you would figure the original cost, the way you have testified here?

A. No.

Q. Now, Mr. Mayer, the firm of Bartlett, Hayward & Co., with which you were connected, has been doing the erecting work of the Consolidated Gas Company for some time past, has it not?

A. Yes, sir.

Q. You have built a large number of holders for them?

A. Yes.

Q. And your concern is now the principal contractor that is building the Astoria works at Astoria, Long Island.

A. My former concern. I am not with them now.

Q. You made up the bids for the Astoria plant, did you?

A. Yes.

Mr. Mathewson: You mean for Bartlett, Hayward & Company?

Mr. Page: Yes.

The Witness: Yes.

Q. As their chief engineer you prepared the bids which were put in?

A. Yes.

Q. And upon which the contracts were afterwards awarded?

A. Yes, sir.

Q. When did you cease your connection with Bartlett, Hayward & Company?

A. May first.

1402 Q. Of this year?

A. Yes, sir. Practically in December last before I went to Europe, but actually not until May first.

Q. What is your business now?

A. Consulting Engineer, making a specialty of gas works construction and special apparatus for gas works.

Q. I suppose your relations are still friendly with Bartlett, Hayward & Co.?

A. Very, I am glad to say, yes.

Q. In arriving at your valuation upon the plans, and by that I refer to the apparatus rather than the buildings, did you take also some standard of valuation like this Kings County Works?

A. I did.

Q. And you computed then that works that produce one million feet are worth so much, and works that produce five million are worth five times as much, is that the way you did it?

A. No, sir, I did not.

Q. Well, how did you? What figure did you use as a multiplier?

A. I figured on each and every apparatus and each and every connection throughout the entire works, separately, and applied as a factor the particular cost of each apparatus.

Q. And the factor of cost you obtained by taking the cost price of the Kings County works, is that it?

A. I did not, only for the buildings.

Q. Well, I asked you that. Read him that question; probably he did not understand it.

Q. (Repeated:) In arriving at your valuation upon the plant, and by that I refer to the apparatus rather than the building, did you also take some standard of valuation like this Kings County works?

A. In a general way I applied a factor as I did in the Kings County buildings, but the factor for the apparatus is entirely different from the factor for the buildings.

1403 Q. What is the factor for the apparatus which you applied?

A. The weight of the apparatus, multiplied by a certain number of cents per pound.

Q. The weight of the apparatus multiplied by a certain number of cents per pound?

A. Yes, varying in amount as the apparatus varies.

Q. Well, you ascertained the value of the bench at 14th Street by that factor?

A. I know what the fire brick and the red brick are worth for a bench of sixes, with elevator furnace. I know what it cost for benches of fives with full depth furnace, and I know what it cost for a direct fire furnace. I add the iron work to those figures at a certain price per pound.

Q. Then, in estimating the apparatus you would not take it by weight entirely and multiply the number of pounds by a certain number of cents, would you?

A. No, they are partly brick work in the construction; you could not multiply it by a certain number of cents per pound.

Q. Did you take the price of brick as it is of today, or as it was in 1899?

A. I got the price of the bench complete from several fire brick manufacturers in New York, for what they would place those benches in position to-day, and to that I added my price for the iron work.

Q. Now, we will take up the retorts. How many benches are there in that?

A. Which one?

Q. 14th Street.

A. There is one retort house containing four stacks of thirty benches each.

Q. How many retorts to a bench?

A. I am just looking for another retort house. Do you just want to consider that one house?

Q. Is there more than one retort house there?

A. Yes, sir, I think there is. That is all for the benches.

Q. How many retorts to a bench?

A. Six retorts to a bench.

Q. That would make altogether 180, would it not?

1404 A. I beg your pardon; there is another stack of benches, twenty-four of those.

Q. With six retorts to a bench?

A. Yes.

Q. What is the size of the first 180 retorts that you have spoken of?

A. 12 inches by 21 inches by 8 feet 6 inches long.

Mr. Mathewson: In the first there are four stacks of thirty benches each. That would be 120, and six to a bench.

The Witness: 720 retorts in the first four stacks.

Mr. Mathewson: That would make 864, would it not?

The Witness: Yes; six times thirty times four is 720 in the first four stacks.

Q. 720 retorts in the first four stacks?

A. Yes, and there is [illegible] in the other stacks.

Q. What is the size of those?

A. 12 inches by 21 inches by 8 feet 6 inches.

Q. If you were to build a plant to-day would you put in that size retort?

A. Yes.

Q. You would I suppose if it were specified, but as a gas engineer, if you were to devise an efficient up-to-date plant, would you use that size of retort?

A. For that kind of installation I would, yes, if it was a horizontal installation and I had the space at my disposal.

Q. Well, this is a horizontal installation, is it not?

A. Yes.

Q. Do you know how long ago that was installed, those particular stacks?

A. It was built in 1900, the last stack.

Q. Of those particular four stacks?

A. Yes.

Q. How much was added at that time, or was it just a renewal?

A. Just renewal; replaced.

Q. Do you know when the others were replaced?

1405 A. I have it here 1900 for the entire house; I suppose they were all reproduced at that time.

Q. What do you mean by resetting?

A. That is a term applied to the construction of benches.

Q. And when it is so applied to the construction of benches what does it mean?

A. That the entire material inside of the arches was reset, or the entire arches are filled with new material.

Q. That means that the fire brick is built in of which the retort is built?

A. Fire bricks, retorts, tiles, and settings; everything complete.

Q. You spoke of fire brick and the retort as something separate. Is not the retort made of fire brick?

A. No, sir.

Q. What is it made of?

A. Fire clay.

POOR COPY

Q. When you burn it it becomes fire brick, don't it?

A. No, sir, in that shape it don't.

Q. Everything else then was old, as I understand it, except that the retort inside the arches was filled with fire clay and the retort built, but the brick work was the same as it has been for a number of years before, and the size within the arches was the same?

A. The arches themselves formed the old brick work.

Q. When you refer to the arches to what particular arch do you refer? The arches that are below the retorts or the arches within which the retorts are placed?

A. Each bench consists of an arch built of fire brick, and the arch consists of two side walls and the arch on top, and the entire space within this arch is filled with setting. The setting consists of retorts, &c.

Mr. **Mathewson**: Is there any arch below?

The **Witness**: There is not.

Mr. **Page**: There is an arched space, is there not?

A. An arched space all above.

1406 Q. Then there is not an arch, as you refer to it, for gas making, but there is an arch that an ordinary man would see there and call it an arch, is there not?

A. Yes.

Q. Wherein does resetting differ from tearing down and rebuilding?

A. That is what it practically is. We tear out and rebuild the entire setting.

Q. The setting?

A. Yes, take everything that there is and replace it all new.

Q. What is taken down and what is left standing?

A. The entire interior work contained in the arch is taken out and rebuilt from new material.

Q. How frequently, in the ordinary operation of a gas plant, do you have to thus renew the retorts?

A. About every three years.

Q. And you say the last of that which was done here was when?

A. 1900, but it has been reset since then later, I believe.

By Mr. **Mathewson**:

Q. Look at your memorandum there, if it is a copy of this, and you can find it.

A. I have it 1900. (Mr. Mathewson indicates on the memorandum). Yes, there is something in 1904 and 1905.

By Mr. **Page**:

Q. The brick work within which these arches are fixed is the same as it has been for a great many years?

A. Yes.

Q. And when you refer to resetting it is merely a renewing of the retorts that takes place about once in three years?

A. Yes.

Q. And otherwise than that those first four coal stacks are the same as they were in 1884?

A. That I could not say, it is possible that the entire arches have been rebuilt since that time.

1407 Q. Of course all things are possible. I was asking for your information if any has been given you. I understood that you had been informed when those different buildings had been built.

A. Yes, I have been.

Q. For what period did you measure depreciation upon this particular apparatus?

A. In some of it, for a few years only, some three years, and some perhaps eight or nine years; the depreciation varies from two to 15 per cent.

Q. But some of these have been standing from 1853?

A. No, it has all been rebuilt since 1853.

Mr. Mathewson: Not the apparatus; he said the buildings.

The Witness: That is, the buildings alone, yes.

Q..But your valuation for the buildings; did you figure depreciation there?

A. Yes.

Q. On these retort houses?

A. Yes.

Q. How much depreciation did you figure?

A. 15 per cent.

Q. Why did you use 15 per cent. depreciation? How did you arrive at that?

A. That is my judgment from the appearance of the building.

Q. That is, this building that has been constructed for fifty-three years you consider to-day is depreciated only 15 per cent.?

A. Yes, for the reason that the building was kept in constant repair in order to serve its purpose.

Q. Did you make any examination of the result of this plant to see whether it was operating efficiently?

A. I know that from my own personal knowledge.

Q. You know that; so you didn't have to investigate that?

A. No, sir.

Q. How many pounds of coke does it take to carbonize 100 pounds of coal in an efficient horizontal retort?

1408 A. From 10½ to 55 pounds of coke to 100 pounds of coal carbonized.

Q. You would make a rate of 10½ to 55 pounds?

A. Yes.

Q. And if a plant was using 55 pounds of coke to carbonize 100 pounds of coal would you think that an efficient plant?

A. No, sir, I would not.

Q. Will you kindly pay attention to the questions and answer the questions that I ask you? I asked you how many pounds of coke it would take to carbonize 100 pounds of coal in an efficient horizontal retort. That is the question. Now, what some man could produce is something that was not efficient is not the question.

A. About twenty-two pounds.

POOR COPY

Q. You would differ then from Mr. Bradley, who said it would take from 10 to 15 pounds?

A. In a full depth generator furnace.

Q. What do you mean by that?

A. A furnace of considerable depth, with generating flues below the settings. Those benches are ordinary 4 by 5 benches.

Q. If you were installing a plant to-day, would you use these generator flues below the settings?

A. I would not.

Q. You would not instal this particular plant to produce efficient work to-day?

A. I would not, not so far as the furnace is concerned.

Q. That is what I mean. We are confining ourselves to this particular retort house. Now, how about the size of these retorts? Would a large size produce better results?

A. No; I should apply the same size retort in the same space, and the building controls the space.

Q. You say a 12 by 21 by 8 feet 6 inches is the size retort that you would use to-day if you were installing a gas plant?

A. Yes, in benches of sixes.

Q. Do they use benches of sixes now?

A. Yes.

1409 Q. I notice that one coal gas stack of twenty-four benches, six retorts, the size is 15 by 26 by 9 inches?

A. Yes, sir.

Q. Can you produce better results with a retort that size than you can with a retort the size of the other 720?

A. No.

Q. You would testify, then, as a gas engineer that the operation of a retort 12 by 21 by 8 feet 6 inches is as economical and produces as good results as a larger retort?

A. Yes.

Q. What is the shape of these retorts?

A. They are D-shaped.

Q. What is the size of the retorts that you installed in Astoria?

A. They are tapering retorts, as near as I can remember, about 14 by 22 inches on one end; I am not sure about that, and I think about 14 by 25 on the other end.

Q. By tapering retorts you mean a modification of the D-shaped?

A. No, it is tapering in length from one end to the other. It is a D-shaped retort.

Q. I am referring now to the horizontal and not to the inclined.

A. I did not instal any horizontal retorts in Astoria.

Q. The horizontal and inclined are two different things?

A. Yes; I did not instal any horizontal retorts at Astoria.

Q. Did you make any estimate on the horizontal retorts that they have over there?

A. I did not.

Q. What value do you place upon the benches?

A. $2,210 per bench.

By Mr. Mathewson:

Q. Does that refer to the four coal gas stacks?
A. Yes; thirty benches each.

By Mr. Page:

Q. Did you estimate this value as you would if you were
1410 bidding to build those benches?
A. Absolutely the same way.
Q. That includes the masonry and the ironwork and everything in regard to the bench, does it?
A. Except the foundations.

By Mr. Mathewson:

Q. Do those preliminary figures include the engineering expenses and the interest which you applied subsequently?
A No, sir, it does not.

By Mr. Page:

Q. Were you building gas works in 1884?
A. Yes, I think I was.
Q. Do you know whether it would cost as much or more or less in 1884 to have built these benches than it would to-day?

Mr. Mathewson: Objected to as not proper cross-examination. We called the witness here to prove the value of this property to-day, as an expert witness. We have asked nothing in reference to the cost in 1884.

Mr. Page: While you may have asked nothing of this particular witness, you put in evidence what it was valued at in 1884.

Mr. Mathewson: This witness is an expert witness, called upon that particular subject.

Mr. Page: Well, I think that goes to his competency and the weight of his testimony.

Mr. Mathewson: I do not agree with you.

The Master: I do not know that I quite follow you as far as that, Senator, but I think you are entitled to ask him the question. It may be you will run the risk of making him your own witness on that point. I will allow it.

1411 Mr. Mathewson: I would suggest that counsel make this witness his own in that connection, if the witness can answer.

Mr. Page: I will take the risk of that, as a proposition of law.

A. It would cost more in 1884.
Q. Now, have you figured a certain amount for depreciation on these benches?
A. Yes, sir.
Q. What is the amount?
A. Some of them, 15 per cent.
Q. On what?
A. On all of them 15 per cent.
Q. And upon what did you base that figure?

POOR COPY

A. Principally upon the present condition of the arches and the ironwork.

Q. And that is the part that has to be renewed every three years?

A. No, sir; that is the part that has to be renewed probably every thirty years.

Q. You would expect the resetting of the retorts to be taken care of under repairs?

A. Yes, sir.

Q. It would come under that item?

A. Yes, sir.

Q. And you think that this plant standing as it is to-day has depreciated to the extent of 15 per cent?

A. These particular benches, yes, sir.

Q. Does your value of $2,210 per bench include depreciation or do you take that off?

A. No, sir, that is taken off afterwards.

Q. What is the value to-day that you have for those?

A. I only have it in total. The total benches for the four stacks of 30 is $265,200, without depreciation, and $225,420 with depreciation taken off.

Q. Have you the other 24 benches?

A. Yes, sir. Those benches cost $2,450 each, making a total of $58,800, and the depreciated value is $49,980.

Q. You say they cost what?

A. $2,450 per bench.

Q. When?

A. As compared with the $2,210 I gave for the other benches.

Q. Well, that is the estimate you placed upon the cost and not the actual cost, is that it? 1412

A. No, sir, that is the actual cost I got from various firebrick manufacturers around this part of the country, to which I added the cost of the ironwork.

Q. You don't know what it really cost the Consolidated Gas Company to install that stack of benches?

A. I don't, but I imagine they would pay more than I would.

Q. Do I understand you called for bids or asked for bids from various manufacturers, on which you based this estimate?

A. Yes, sir.

Q. Then you did not depend upon your experience of so many years as a gas engineer as to what it would cost, and as a man who constructed so many works?

A. I should do exactly the same if I had to build the works today, I should have to go to some firebrick manufacturers and get their prices, and buy their material for that part of the work and then add my prices for the ironwork.

Q. You referred to the foundation for benches. Just what is the foundation for the benches?

A. Is this 14th Street?

Q. I mean generally. Do you mean that portion that is down underground?

A. Yes, sir. It is that portion below ground.

By Mr. **Kirby**:

Q. Are there any foundations for other than the benches you have mentioned?

A. Yes, sir.

Q. How many?

A. There is one foundation for each stack.

Q. Are there any foundations upon which stacks have not as yet been erected?

A. No, sir.

Q. How many foundations does that make altogether?

A. Five.

Q. How many benches stand upon those foundations to-day?

A. Well, on four of them there are thirty benches; and on one, twenty-four benches.

1413 Q. So there are fifty-four benches?

A. Oh, no, there are four times thirty, which is one hundred and twenty, and then twenty-four is one hundred and forty-four.

Q. One hundred and forty-four benches?

A. Yes, sir.

Q. What depreciation factors did you use in the foundation?

A. None.

Q. Simply estimated the cost of material and labor as it was given to you?

A. Well, it is very hard to give any information regarding foundations under benches, or in fact under anything.

Q. How did you get your information?

A. By general inquiry at the works, from which I learned that everything is put upon pile foundations. Of course, the piles have to be cut out at the water line to prevent them from rotting, and that gives me the length as to the foundation, and on these facts I estimated the cost.

Q. Did you get that from the Consolidated Gas Company?

A. I got it from the superintendent that was there when it was built.

Q. And then did you give that information to various contractors and receive bids from them?

A. No, I made my own estimate.

Q. With regard to the stacks, however, you got your information from other contractors, did you not?

A. Yes, sir.

Q. Have you ever put down tiles of any kind?

A. Yes.

Q. Have you estimated on work of that kind?

A. Yes, sir.

Q. What is the age of those foundations, do you know?

A. I think they were built in the fifties.

Q. Would they cost more or less then to put down than now?

Mr. **Mathewson**: Same objection.

1414 The **Master**: Same ruling.

Exception.

POOR COPY

A. I don't think there would be much difference in the price for foundations.

Q. How many foundations were there there?

A. Five.

By Mr. PAGE:

Q. As part of the cost of the coal stacks, do you include the hydraulic main?

A. It is included in the benches.

Q. Then that estimate of yours covers everything in regard to the apparatus for making the gas and carrying it through the hydraulic main?

A. Yes, sir.

Q. What value did you set upon the stoking machines? If you have them separately, you might give them separately.

A. There are four; $16,000.

Q. That is $4,000 each?

A. $4,000 each, yes, sir. There is another one at $4,400. That is the one for the large stock.

Q. What about the De Brower stoking machine?

A. $10,500.

Q. How old are these machines?

A. That I can't tell.

Q. What depreciation did you figure on them?

A. Five per cent.

Q. How did you arrive at that figure for depreciation?

A. That is more depreciation than ought to apply because the machines have got to be kept up in a complete state of repair, always in order, to maintain their working capacity.

Q. And are they in a complete state of repair?

A. They are.

Q. What about the drawing machines? How much for the five Ross drawing machines?

A. $25,000.

1415 Q. That is $5,000 apiece?

A. Yes.

Q. And the large——

A. $5,400.

Q. On these drawing machines, I want the age of the drawing machine and the amount of depreciation. Have you figured it?

A. Five per cent. on the machine for the large stack and 2 per cent. on the five machines for the other stack.

Q. How did you arrive at those two items of depreciation?

A. My judgment of the conditions of the machines. As I said before I think the depreciation applied is more than it ought to be.

Q. That is, your judgment now as to the depreciation is different than what it was when you examined the machines and made up your figures?

A. No. You cannot exactly determine the value of depreciation and in order to be absolutely fair I took the outside figure which I thought would apply. I could have applied less and had the same opinion.

Q. Do you know how old those machines are? How long they have been in use?

A. No, I didn't ask about that because these machines have been kept in perfect condition continuously.

Q. They have been?

A. They have been, yes. Of course there is small wear and tear and repairing which at the present day I cannot just exactly establish. Five per cent. would be an outside figure.

Q. Now, we will go to these turntables. For what are they used?

A. For transferring the stoking and drawing machines from one side of the house to the other.

Q. What is your value of those?

A. $630 each.

Q. Any depreciation on those?

A. Five per cent.

Q. Is that figured on all these items relating to the track?

A. Yes, sir.

Q. There are six lines of track running the length of the building and 20 feet outside?

A. Yes, sir.

1416 Q. Seventy-pound rails, 6 by 6 cross ties?

A. Yes, sir.

Q. These on 6 by 8 stringers?

A. Yes, sir.

Q. What do you value that line of tracks at, so equipped?

A. Six lines, $5,050.

Q. Now, these coke tracks?

A. Four lines of coke tracks, $1,350.

Q. They only run the length of the retort house, is that right?

A. The length of the retort house and then the inclines outside of it which follow right after.

Q. How long is the entire length of the four lines of track—is it the length of the building plus thirty-two feet?

A. Yes, sir, in one instance, and I think forty in the other. That is, you will find two more down below forty feet.

Q. Two of them are thirty-two feet longer and two of them forty feet longer than the building?

A. Yes, sir.

Q. What do you mean by 3½-inch rails multiplied by 35 pounds?

A. 3½ inches, that is the height of the rails, by 35 pounds per yard.

Q. What is the value of these two coke dumping inclines over thirty-two feet long and sixteen feet high?

A. $1,500.

Q. That includes the gauge, benching arrangements and the 2-inch pipe, does it?

A. Everything complete.

Q. In connection with that you have two engines, have you, seven horse-power engines?

A. Yes, sir.

Q. And that, together with the operating cable, is worth how much?

POOR COPY

A. $450.

Q. How much are the nine self-dumping coke machines worth?

A. $1,125.

Q. That is the entire nine?

A. Yes, sir.

Q. What value did you place upon the forty feet of coke dumping inclines, twenty feet high?

A. $2,070.

1417 Q. And on the coke drums and hoisting arrangement and countershaft connected to the gas engine?

A. $380.

Q. And the 2-inch pipe clinching arrangement?

A. $50.

Q. And upon all those I understand that you figure a net depreciation of 5 per cent.?

A. Yes, sir.

Q. Do you know whether these five Ross Drawing machines are the same that were in use in 1884?

A. I do not.

Q. The next thing in the process of gas manufacture would be to go to the exhauster house, wouldn't it?

A. Yes, sir.

Q. Now the contents of this exhauster house were one Number 9 Roots exhauster, 24-inch connections, by-pass, exhauster direct-connected to engine, 3,500,000 cubic feet capacity, including the engine. What value do you place on that?

A. $1,980.

Q. How much do you allow for depreciation?

A. None.

Q. Do you know how old that is?

A. No, sir.

Q. But you consider it just as good to-day as the day it was put in, no matter how long ago it was?

A. It is absolutely perfect in every respect.

Q. Then there is another Number 6 Roots exhauster?

A. Yes, sir.

Q. Direct connected to the engine, 20-inch connections with by-pass, capacity 2,000,000 cubic feet.

A. Yes, sir.

Q. How much did you value that at?

A. $1,078.

Q. There are two Huntoon governors?

A. $150.

Q. Those are attached to each of the exhausters or attached to the engine?

A. They are attached to the engine and governed by the gas.

Q. What do you value the photometer, stand and bar at?

A. $65.

Q. What kind of a photometer is that?

A. Bar photometer.

1418 Q. What is the length of the bar?

A. I did not measure that.

Q. Is it one or two candles?

A. It is arranged for any candles you like.

Q. But as against testing gas, against one candle or two candles?

A. You can test any candle power from nothing up to thirty candles and even higher.

Q. I know that. You test your light, though, on one end of your photometer as against a candle on the other, one or two candles, don't you, when you are using a bar photometer?

A. Yes, sir.

Q. I asked, is this arranged for one or two candles?

A. Well, you can apply either.

Q. This just refers to the machine itself, does it?

A. The contents of the exhauster house?

Q. No, I say this one photometer, stand and bar, $65, refers to the machine itself?

A. Yes, sir, purely the apparatus.

Q. Now in the condenser house you have two No. 2 rectangular condensers, cast iron tubes, 44 feet by 15 feet by 6 feet 2 inches; 648 tubes, 4 inches in diameter 11 feet long, 30-inch connections. At what do you value those?

A. $29,106 for the two.

Q. And upon that you figure a depreciation of how much?

A. 15 per cent.

Q. Do you know the age of this apparatus?

A. No, I do not.

Q. Would that cost more to-day than it would in 1884?

Mr. Mathewson: Same objection.

The Master: Same ruling.

Exception.

A. Yes, it might cost a little bit more.

Q. When?

A. Now.

Q. It would cost more to-day than then?

A. Slightly more, not very much.

1419 Q. Do you know whether those are the same two condensers which were there in 1889?

A. I do not.

Q. Is that the type of condenser that is used to-day?

A. Yes, sir.

Q. Does the value which you have given include the valves and connections?

A. No.

Q. Have you valued the valves and connections separately?

A. Yes, sir.

Q. What does this mean, by connections 30 inches?

A. That is only a memorandum to show the size of connections for the apparatus.

Q. Then the value that you gave of $29,106, would be the value of the two condensers alone?

A. Yes, sir.

POOR COPY

Q. Now there are two purifying houses are there?

A. Yes, sir.

Q. Now the large purifier house, I find two sets of 8 purifying boxes 24 feet by 26 feet by 3 feet 2 inches, connections 20 inches?

A. Yes, sir.

Q. What do you value those at?

A. Well the entire two sets together with the covers and the cranes and the supports for the boxes and center seals is $48,876 without any depreciation.

Q. You value those in their entirety?

A. Yes, sir.

Q. What is the capacity of that purifying house?

A. I have not figured that, but the capacity of the two houses combined is equal to the capacity of the plant.

Q. In other words, the capacity of the purifying house determines the capacity of the plant, doesn't it?

A. In a measure, yes.

Q. Now the small purifying house?

A. One set of 4 boxes 16 feet by 25 feet by 3 feet 2 inch center seals, supports, and two hydraulic cranes, $16,828.

Q. That includes the supports and pressure gauge, does it?

A. Yes—no, the pressure gauges are extra, $35 for that small house.

1420 Q. Do you know the age of the apparatus in these two purifying houses?

A. I do not.

Q. Upon what do you figure your 5 per cent. depreciation?

A. Upon the present condition of the apparatus.

Q. That is, if it was regarded as against a new apparatus to-day you think there would have been a depreciation of 5 per cent.?

A. Yes.

Q. In its present condition?

A. Yes.

Q. And you have not taken into consideration in figuring depreciation the actual age of the apparatus?

A. No, I have not for the reason that age does not affect an apparatus of this kind except in one spot, and that is the sides of the covers which forms a very small portion of the entire purifying apparatus.

Q. Therefore, there is with the exception of the sides of the covers, which when they wear out were replaced as repairs——

A. But very little cost.

Q. But very little cost?

A. Yes, sir.

Q. There is practically no depreciation on a purifying plant?

A. No, sir.

Q. I find you have center seals in the purifying house and you also have a center seal house. To what use is this center seal house put?

A. In this instance the center seal is located outside of the building. The center seal is an apparatus which controls the flow in and out of the various purifiers. In some instances it is located under the purifier itself, but in this instance it is located outside the building in a small annex surrounding it.

Q. Is there a center seal within the purifying house and another one outside?

A. Just outside the purifying house in a small annex around it.

Q. Is there one inside and one outside?

A. No, sir; only one to each purifier.

1421 Q. Then the center seals you have testified to in each purifying house would be the center seals as spoken of in the center seal house?

A. Yes.

Q. And there would be no separate value for the center seals contained in that house?

A. No, the center seal is included in my valuation of the purifiers, but no connections.

Q. I understand that, your connections in all cases have been the valuation you gave at the end for yard connections and valves?

A. Yes.

Q. And that applies to all the apparatus?

A. Yes.

Q. I notice in the yard two tower scrubbers, 20 inches in diameter by 84 feet 2 inches over all, capacity of each one million cubic feet per twenty-four hours?

A. Yes, sir.

Q. Eight sections of eight trays each, except lower, which has seven trays; connections 24 inches. Have you valued that separately, or did you value it in connection with the tower?

A. I figured the two scrubbers as an entirety without any connections and valves the same as in the other cases.

Q. Will you give the valuations as you have placed them there upon the items?

A. Two scrubbers, $40,390; a 14 foot water tank on top of the scrubbers, $1,764; a circular stairway enclosed in a steel shell, $672, making a total of $42,826.

Q. What do you value the foundation at?

A. $7,854.

Q. Have you figured anything for depreciation on this?

A. Eight per cent.

Q. Do you know anything about the age of those scrubbers?

A. No, sir.

Q. Do you know whether or not they are the same two tower scrubbers that they had in 1884?

A. Yes.

Q. Are they?

A. I believe they are.

1422 Q. How did you figure the brick circular walls from top of concrete to ground level, 6 feet from ground to bottom of concrete?

A. In which item is that?

Q. In the foundation.

POOR COPY

A. 800 cubic yards of excavation, 300 piles, 300 cubic yards of concrete and 52,000 bricks and the granite sills.

Q. What value did you take for those?

A. $7,854.

Q. I know, but——

A. The units?

Q. Yes.

A. Excavation $1.25 per cubic yard, piles $5.00 each; concrete $7.00 per cubic yard; bricks laid $25 a thousand.

Q. Is that based on bids you received?

A. No, sir, it is my own estimate.

Q. On the prices of to-day?

A. Yes, sir.

Q. Now there is another scrubber, Isbell Porter, standard scrubber?

A. Yes.

Q. That is a rotary scrubber, is it not?

A. Yes, sir.

Q. 16 feet 6 inches long, 13 sections, end section 7 feet 9 inches wide by 8 feet two inches high; disc 6 feet 9 inches diameter by 8, capacity 3,000,000 cubic feet for twenty-four hours, 30-inch connections 7 feet 7, 4 inches diameter?

A. That means 7 inches by 7 inches.

Q. 4 inches diameter, shaft, worm gear and wheel connections, wheel 48 inches diameter. What did you value that at?

A. $6,860.

Q. What did you allow for depreciation?

A. 2 per cent.

Q. How old was it?

A. 1892 I have it down here.

Q. Two number 2 Cameron pumps; what are they worth?

A. $110.00.

Q. Each or for the two?

A. Both.

Q. How many station meters have they at these works?

A. 2 sixteen feet diameter.

Q. Will you give the value, please?

A. $13,540. They are 16 by 13 feet.

1423 Mr. Burr: Is that for each or for both?

The Witness: For both.

Q. That is American meter make?

A. Yes, sir.

Q. And Parkinson drums?

A. Yes, sir.

Q. 20-inch connections?

A. Yes, sir.

Q. One No. 12 Westinghouse gas meter?

A. Yes, sir.

Q. What is that?

A. It answers the same purpose, but is differently constructed, $225.

Q. Then the value of the other articles in the meter house?

A. Kings pressure gauge, $35. Iron grating, platform around meters $315.

Q. We have practically gone through the apparatus through which the gas itself passes, have we not, from the retort to the holder?

A. Yes.

Q. Now will you turn to your schedule of the boiler room?

A. Yes, sir.

Q. And give us the value of the boiler?

A. $2,109.

Q. That is an 80-horsepower boiler?

A. Yes, sir, that is what it is rated.

Q. And built by T. F. Rowland?

—. Yes, sir.

Q. Do you know the age of that boiler?

A. No. That is in a thoroughly up-to-date condition.

Q. But if it was built by T. F. Rowland it was some years ago that it was built?

A. Yes, sir.

Q. How many should you say?

A. I did not inquire because the boiler was in perfect condition.

Q. How long ago did Rowland retire from business, do you know that?

A: No, I do not.

Q. Now will you give us the various items of the engine room. Was there anything else that entered into the boiler room?

A. No, there is one Clark steam and fire regulator at $25. A cast iron water tank 17 feet by 48 feet by 4 feet 6 inches deep over the entire boiler house, which forms the roof of the latter.

1424 Q. How much is that worth?

A. $4,275.

Q. Did you take any depreciation off from either of those items?

A. Five per cent. on the boilers, none on the regulators, and two per cent. on the cast iron tanks.

Q. Now, then, the engine room. You have first a forced draft fan for blowers, B. F. Sturtevant fan and engine, 3-foot fan and wheel, case 18 inches wide, direct connected with small vertical engine. What value did you place on that?

A. $250.

Q. Anything off for depreciation?

A. Two per cent.

Q. One simple engine, Novelty Iron Works, 50 horsepower?

A. $3,000; twelve inches diameter, two-inch stroke. It is a special engine.

Q. Two small boiler feed pumps.

A. $100.

Q. Two jet photometers at $65 each.

A. $130.

Q. Mackenzie exhauster?

A. $924.

Q. Sink?

A. $25.

POOR COPY

Q. Now, will you take the items on the various portions of the plant that have not been covered and give us the value, age, and depreciation as far as you know it, on every item of over a thousand dollars in value. Below that you need not.

A. Any item of over a thousand dollars?

Q. I mean, not to go back, but taking up here in the smith shop, machine shop and shed, &c.

A. I could give you the total items for that. Machine shop total contents?

Q. No, if there is nothing there over a thousand dollars just pass over it.

A. I have got one shed.

Q. The whole shed only amounts to $1,800. Everything that is in it?

A. Everything in it.

Q. I mean in the matter of items.

A. Oh, individual items.

Q. Yes. You have given, as I understand it, the total value of everything that is in these particular houses, the buildings, on your direct-examination.

A. Yes.

1425 Mr. **Kirby**: He gave the total value of all.

The **Witness**: I gave the total value of all, not of each house.

Mr. **Mathewson**: Not dividing it into each separate house?

Mr. **Kirby**: Let it be where there is apparatus of over a thousand dollars, and give that.

Q. Yes, give us the total of each house, and where in that house there is apparatus of the value of a thousand dollars and over you can give us the total of that.

Mr. **Mathewson**: Would it not be a good thing to give that in the order in which they appear on the record; taking the office, store and then the boiler room, &c.?

The **Witness**: That is what I was going to do just now, start from the beginning.

The **Master**: That is the better way, then you will have it complete on the record.

A. Office building, contents $1,875.

Mr. **Mathewson**: Are you giving those items without depreciation or after the deduction of depreciation? Is the total you are giving the value without deduction of depreciation or after the depreciation is deducted?

Mr. **Kirby**: He had better give both.

Mr. **Mathewson**: I am merely asking him so that he can find out what you want. I do not care what he gives.

Q. Give the total with depreciation and then the total deducting depreciation?

A. With and without depreciation?

1426 Q. Yes, both.

A. Contents of office building without depreciation, $1,875; with depreciation, $1,781. Storehouse, contents, $100; with depreciation, $100.

Mr. Page: We have had the boiler room and the engine room.

Mr. Mathewson: But he has not given the totals.

A. (Continuing:) Machine shop, $700 without depreciation; $665 with depreciation.

Smith shop, $430 without; $408 with.

Grindstone, $395 without; $356 with.

Mr. Page: We do not want the value of the grindstone at $395. It is grindstone, circular saw, lathe, turning tools, counter shaft, &c.

The Witness: Yes.

Mr. Mathewson: When you state your value, describe what it is.

A. (Continuing:) Shed, contents, $1,800; no depreciation.

Large purifier house, $48,876, less depreciation, $46,432.

Small purifier house, $16,828 without depreciation; $15,987 with.

King's pressure gauge, $35, no depreciation.

Meter house, we had that before.

Centre seal house, four King's pressure gauges, $140; no depreciation.

Pressure gauges, $140; no depreciation.

Checkered cast-iron runway around seals, $258; no depreciation.

Mr. Burr: You have left out the Smith & Farmer's duplex dry centre seals, 20-inch connections.

1427 The Witness: They are included in the price of 24 feet by 26 feet purifier house.

Boiler house, one locomotive boiler and tools, 35-horse-power 5-inch diameter shell, 14 feet 7 inches long, sixty 3-inch tubes, without depreciation, $1,918; with depreciation, $1.726.

By Mr. Kirby:

Q. Do you know the age of that boiler?

A. I have not got it down here. I had it when I made up my schedule, but I did not put them all in.

Valve house, contents, $335, no depreciation.

Retort house, four coal gas stacks, 30 benches, etc., without depreciation, $265,200, with depreciation, $225,420.

One coal gas stack, 24 benches, etc., without depreciation, $58,800, with depreciation, $49,980.

Four Bronder stoking machines without depreciation, $16,000, with depreciation, $15,200.

One Bronder stoking machine, $4,400, with depreciation, $4,180.

One De Brower stoking machine, without depreciation, $10,500, with depreciation, $9,975.

Five Ross drawing machines without, $25,000, with $24,500.

One Ross drawing machine without $5,400, with $5,130.

Three extra engines for retort house, $705 for the three, no depreciation.

POOR COPY

Six turntables, fourteen feet diameter, $3,780.

Six line track, &c., $5,050, no depreciation.

Four line coke track, &c., $1,350, no depreciation.

Two coke dumping inclines, $1,500.

Two 7 horse power single cylinder engines, $450.

Nine self-dumping coke cars, $1,125.

Two coke dumping inclines, $2,070.

Two drums and hoisting arrangement, &c., $380.

Two-inch pipe quenching arrangement, $50.

1428 On all items from six turntables to 2-inch pipes inclusive, 5 per cent. depreciation, making a total for such items, without depreciation, $15,755, and with depreciation, $14,967.

Retort house annex, contents, $16,370, without depreciation, $15,880, with depreciation.

Coke passage, $8,075 without, $8,059 with.

Gas engine house, total, $3,666 without, $3,597 with.

Coal hopper, contents, $3,315 without, $3,249 with.

By Mr. MATHEWSON:

Q. That refers to each of the buildings where you simply mentioned the building without defining the contents?

A. Yes, sir.

Coal shed, $6,250 without, $6,064 with.

By Mr. KIRBY:

Q. That includes the item under addenda to the coal shed, does it not?

A. Yes, No. 3.

Rigger house, $565, no depreciation.

Coal and coke storage, 30,000 tons of coal not included in valuation.

Coal handling apparatus, cable, buckets, &c., included in coke passage.

Boiler and engine house:

One 55 horse power vertical boiler, $734 without depreciation, $713 with.

One 50 horse power two-cylinder, 12 by 20, $1,000 without depreciation, $970 with.

One 25-foot sheet iron stack, $75 without, $73 with.

One small feed water pump, $55 without, $54 with.

Boiler house and well, $350 without, $341 with.

1429 By Mr. MATHEWSON:

Q. Did you add tools to that boiler house?

A. One vertical boiler?

Q. And tools for the boiler? What does that mean?

A. That is tubes, not tools. Two 66-inch diameter——

Q. Thirteen horse power boiler with tools?

A. Thirteen horse power boiler and tools for boiler.

Q. That is what I said.

A. Yes. $350 without, $341 with.

Well house, $1,042, no depreciation.

By Mr. MATHEWSON:

Q. Including addendum, item No. 4?

A. Yes, sir, No. 4.

Boiler house, one boiler 4 foot diameter, 10 feet 3 inches long, without depreciation, $607, less depreciation, $589.

Eighteen-inch sheet iron stack, $38, without depreciation, $37 with depreciation.

One clock, $15.

Pressure gauge, $8.

Valve house, $80, no depreciation.

New York safety, 14 by 60, engine, $1,980, no depreciation.

One Mackenzie exhauster, $3,050, no depreciation.

One King's pressure gauge, $35, no depreciation.

Thirty-inch valve stands, $525, no depreciation.

Photometer, $650, no depreciation.

Ten one-half Root exhauster, additional, $1,600, no depreciation.

Boiler house, two 50 horse power corrugated flue boilers, $2,860, without depreciation, $2,720 with depreciation.

Two stacks, $234, no depreciation.

Yard total, $2,804, without depreciation, $2,636 with depreciation.

1430 By Mr. KIRBY:

Q. In the yard there is an ammonia tank which you value at $1,008, is there not?

A. Yes, sir.

Q. Is there any depreciation on that item?

A. Six per cent.

Coke office, $185, no depreciation.

Boiler house, total, $2,029 without depreciation, $1,970 with depreciation.

Q. This includes the items in addenda item 6, does it not?

A. It does.

In the boiler house is one 50 horse power engine valued at $1,000, 2 per cent. depreciation.

Q. Giving a depreciated value at $980?

A. That is right.

Q. Clay mill and storage; $480 without depreciation; $460 with depreciation.

Storage sheds; 78 tons fire clay omitted from valuation as per item No. 7 in addenda.

By Mr. PAGE:

Q. Was that included in the total valuation that you gave?

A. No, sir; taken out.

Stable and yard, $455; no depreciation.

POOR COPY

Pump house, $240 without depreciation; $235 with depreciation.

Storage shed, scrap iron, $600.

Q. Why do you include the 50 tons of scrap iron?

A. That should come out.

Q. Your total figures ought to be reduced by $600?

A. By $600, yes, sir.

Storage shed, $415; no depreciation.

Weight office, $395; no depreciation. I think that covers it all.

Q. Now you have how many holders in that plant at 14th Street?

A. There are 6 holders of 345,500 cubic feet capacity each, and 2 holders of 250,000 cubic feet capacity each.

1431 Q. Take the 6 holders. What do you value the tanks at, including guide plates and inlets?

A. $219,039.

Q. Do you know when the tanks were constructed and erected?

A. No, I do not.

Q. Is that given with or without depreciation?

A. There is no depreciation.

Q. Did you include in that value the retaining walls?

A. Yes, sir.

Q. And what did you value the holders and frames of the six gas holders at?

A. $178,885.

Q. Is there any depreciation there?

A. 15 per cent., making a total value of $152,052.

Q. Can you state whether or not those were the holders that were on this property in 1884?

A. I cannot.

Q. Of the two additional holders that you have given of the smaller capacity, the two at 250,000 cubic feet capacity each, will you give us the valuation for the tank and for the holder and for the frames?

A. The value of the tank is $57,383, no depreciation. The value of the holders is $52,091, less 10 per cent., making a value of $46,082.

Q. Those two holders are separated from the others, aren't they?

A. Yes, sir.

Q. That is the six are on the block bounded by 14th and 15th Streets, Avenues B and C?

A. Yes, sir.

Q. And the two are on the block bounded by 17th and 18th Streets and Avenues B and C?

A. Yes, sir.

Q. Do you know whether the capacity of those plants has been increased since 1884?

A. No, I do not.

Q. Now all of these holders are in brick tanks, aren't they?

A. Yes, sir.

Q. How did you arrive at the value of the brick walls around the

property? I don't mean the holders, I mean the walls around
1432 the yard?

A. The tank itself?

Q. No, no. You said there were some brick walls that were built around the yard?

A. Yes.

Q. That is what I refer to.

A. They were figured in detail; so many bricks.

Q. How deep below the surface does the foundation of the wall go?

A. Four feet.

Q. Is this foundation of brick?

A. Are you referring to the tank wall?

Q. No, the wall around the yard, what is practically the fence.

Mr. MATHEWSON: Is this the wall around the holder inclosure?

Mr. PAGE: No, whatever it is. He has got several brick walls.

Mr. MATHEWSON: Yes, I know, but I am trying to find out which——

Mr. PAGE: It is on page 1352.

A. That is the first item of holder value.

Q. How did you arrive at the value?

A. It was estimated in detail: 736,000 bricks, 536 cubic feet of bluestone and 1,000 cubic yards of excavation.

Q. The excavation was for four feet in depth?

A. Foundation, yes, sir.

Q. And the twelve feet in height included foundation, did it?

A. It is above the grade, the four feet is below grade.

Q. Sixteen feet altogether?

A. Yes, sir; that is the foundation.

Q. How wide is that wall?

A. Twelve inches thick.

Q. You said there were 20-inch pilasters. What is the distance between pilasters?

A. I don't know what the distance is, but there are twenty-five pilasters altogether.

1433 Q. Does that mean twenty inches in width?

A. Twenty inches in width and four inches projection from the surface of the brick wall.

By Mr. MATHEWSON:

Q. On each side of the wall, isn't it?

A. On one side.

By Mr. PAGE:

Q. Then the wall under pilaster would be sixteen inches wide?

A. That is right.

Q. And would extend twenty inches?

A. Yes, sir, twenty inches in width.

POOR COPY

Q. All of these gas holders that you have testified to are brick tanks?

A. Yes, sir.

Q. If you were building them to-day would you build them of brick or steel tanks?

A. That would depend upon the character of the ground.

Q. Well, at this particular place, I mean?

A. At this particular place I would only build them of brick.

Q. Which is the cheaper construction, brick or steel tank?

A. In this instance?

Q. I am referring to the original construction, whether it costs more to build a brick tank or a steel tank?

A. Well, a steel tank of the same dimensions is cheaper than a brick tank.

Q. Now, we will turn to the 42d Street station. This is also a coal gas plant, is it not?

A. Yes, sir.

Q. And of what capacity?

A. 4,500,000 cubic feet in twenty-four hours.

Q. On your direct-examination you gave the dimensions of the various buildings and then gave the total valuation of all the buildings, but you did not give the value you place upon each building.

A. No.

Q. Have you them separated?

A. Yes.

Q. Will you give that? I don't mean to segregate them, but the total for each building with and without depreciation. 1434

A. Valve house and vault in the yard, $1,862; no depreciation.

Q. Do you know when that was built?

A. 1863.

The Witness: Do you want all these items?

Q. No. You need not separate the items.

A. Vault, $2,499; no depreciation.

Meter house, $958 without depreciation; $910 with depreciation.

Q. When was that built?

A. 1863.

Purifying house $63,439 without depreciation; $57,076 with depreciation. The first figure should be $72,250; without depreciation, and $65,006 with depreciation.

Q. What is the item of $8,811 which you have added?

A. That is under addenda item No. 2. That is for additional cost of the vault. It is explained in the addenda, item No. 2.

Q. Was that a part of the original construction in 1863?

A. Yes, sir, it was omitted from the first item by not allowing anything for planking, pumping and sheet piling.

Extension to main building, same house, purifier house, $3,877 without depreciation; $3,490 with depreciation.

Q. Do you know when the extension was built?

A. I presume it was built at the same time that the main house was built.

Q. That was in 1863?

A. Yes, sir.

Engine and meter house $17,476 without depreciation; $16,639 with depreciation.

Vaults, $7,125; no depreciation.

Toilet, $90 without depreciation; $81 with depreciation.

Retort house, $132,997 without depreciation; $126,348 with depreciation.

Q. What is the additional item which you have added?

1435 A. Additional cost for bench foundations and the same items, planking, capping, pumping and sheet piling.

The next is condenser and scrubber house $13,520 without depreciation; $12,844 with depreciation.

Q. That was also built in 1863?

A. 1863, yes, sir.

Retort house- Nos. 2 and 3 $82,774 without depreciation and $78,636 with depreciation.

Vault for the same building, $12,834, no depreciation.

Exhauster engine and scrubber house, $29,643 without depreciation; $28,161 with depreciation.

Retort house No. 4 $11,216 without depreciation; $10,656 with depreciation.

Q. That building was built in 1863?

A. In 1863.

Q. And a depreciation of five per cent.?

A. Five per cent.

Vault south of No. 1 retort house and north of Nos. 2 and 3 retort houses, $45,229 without depreciation; with depreciation; $45,229, no depreciation, in other words.

Q. No depreciation on that?

A. No depreciation on that, no.

Q. Which vault is this?

A. This is the vault south of No. 1 retort house and north of Nos. 2 and 3 vault between purifier house and exhauster engine and scrubber house, $4,633. No depreciation.

Shed, $1,008 without depreciation and $807 with depreciation.

Coal shed No. 1 without depreciation, $54,055. No depreciation.

Q. This shed was built when?

A. 1887.

Q. All the buildings which you have given up to this time were built in 1863, is that right?

A. I believe they were, up to this time, yes, sir.

Q. Proceed.

A. —.

One coal shed with runway overhead, $1,000. No depreciation.

1436 Q. That was built in 1887?

A. 1887, yes, sir.

No. 2 coal shed, $71,531. No depreciation on that.

Q. And built in 1887?

POOR COPY

A. And built in 1887.

Carpenter shop, $156. No depreciation.

Q. That was built in 1887?

A. Yes, sir.

Brick fence on 11th Avenue, $4,643. No depreciation.

Q. That was built in 1863?

A. 1863.

Brick fence on 42nd Street, $5,267. No depreciation.

Q. Built in 1863?

A. In 1863.

Main building, stable and wagon shed, $24,579 without depreciation, $23,350 with depreciation.

East extension of above shed, $1,680 without depreciation, $1,596 with depreciation.

Another extension to above, $2,136 without depreciation, $2,029 with depreciation.

Q. Those were all built in 1863?

A. All built in 1863.

Building used for storing of hay, straw, &c., $3,715 without depreciation, $3,530 with depreciation.

Harness house, $1,965 without depreciation, $1,867 with depreciation.

Coke storage, weigh office, $492 without depreciation, $467 with depreciation.

Q. Both of those buildings last mentioned were built in 1863?

A. Yes, 1863.

Iron bridge crossing Twelfth Avenue, $3,050, no depreciation.

Q. When was that built?

A. 1886.

Q. Proceed.

A. Now I have to skip over to the addenda. These are buildings which are not contained on the original list.

Q. They have been given on your direct testimony, haven't they?

A. Yes, they are all shown here in the addenda.

1437 By Mr. KIRBY:

Q. Frame building for deodorizing purposes?

A. Yes, sir, frame building for deodorizing purposes, $890 without depreciation, $801 with depreciation.

Q. Have you got when that building was put up?

A. No, I have not got that. Cribbing and earth filling for eight oil tanks, eight feet diameter by 25 feet long, $2,438, no depreciation.

Frame pump house on pier, $320 without depreciation, $288 with depreciation.

Timber ash dump, $2,500, no depreciation.

Timber retaining fence around coal storage, $2,800 without depreciation, $2,520 with depreciation.

Q. That is the 700-foot fence you mentioned yesterday?

A. Yes, sir, 700-foot fence. That is in the addenda. That is all for the buildings.

Q. You failed yesterday to give the dimensions of the vault. Can you give us that now?

A. That is a very long description for each of the vaults. There is one vault under the octagonal brick building. The vault is 17 feet by 18 feet with 12-inch brick walls and foundation of piles, piles cut off 12 feet below grade line. Do you want a complete description of it?

Q. Yes.

A. Roof of vault, iron beams with brick arches. Vault eight feet high inside. Floors concrete 12 inches thick. Three air shafts from vault four by five by five feet high. One iron stairway from vault to yard. You only want the descriptions referring to the vaults themselves, do you?

Q. Yes.

A. That is all for the one vault.

Q. That vault you have appraised at how much?

A. $2,499.

Vault for engine and meter house. 20 by 38 by 9 feet, 16-inch walls on pile foundation, areaway on east side of vault, 4 feet wide, 10 feet high, 16-inch brick walls, coped with bluestone, and
1438 covered with wrought-iron grating.

Mr. MATHEWSON: Are those vaults?

The WITNESS: Vaults.

Mr. KIRBY: He has valued the vaults and areaway together.

Q. At how much?

A. Well, there are some more vaults come into that additional.

Q. Add them altogether.

A. No, that is all. $7,125.

Vault on south side of No. 2 and No. 3 retort house, 150 feet by 15 feet; vault, roof watertight, brick walls 20 inches thick on pile foundation, floor flagged, 11 feet 6 inches below sidewalk, roof 12-inch I-beams, 6 feet centre to centre 16 feet long, filled with brick and concrete arches, $12,834.

Vault south of No. 1 retort house and north of No. 2 and No. 3 retort house, floor flagged, roof formed of iron beams with brick and concrete arches, covered with flagstones, 3 inches thick, perfectly watertight, five vault lights 3 feet by 5 feet, with cast-iron frames and glass, adjustable hatches and wrought-iron pipe railing.

Q. This vault you valued at how much?

A. $45,229.

Vault between retort house and exhauster engine and scrubber house, 137 feet by 9 feet; same heights as vault on south and north side of Nos. 1 and 2 and 3 retort houses; side walls are walls of adjoining buildings; no partition walls; no adjustable hatches, $4,633. I believe that is all for the vaults.

By Mr. PAGE:

Q. That completes the buildings?

POOR COPY

A. That completes the buildings and the vaults.

1439 Q. In estimating the values of the buildings which you have given did you resort to the estimate as in ascertaining the value of the 14th Street buildings?

A. I did, sir.

Q. That is, you took those buildings of the Brooklyn Company that you spoke of as the standard?

A. In comparison, yes, sir.

Q. And when you had completed your estimate of the value of the buildings, you added 10 per cent. interest to the value, did you?

A. Yes, sir.

Q. And what was that for?

A. For the same item as in the instance of the 14th Street plant, for general engineering, draining, sewering, &c.

Q. What do you mean by general engineering?

A. Engineering for the entire plant as such, but not for the individual buildings, the laying out of the entire plant.

Q. Is there any established rates that engineers charge for such services in laying out a plant and supervising its construction?

A. I do not know that there is; I do not know that there is any established rate. That item was explained yesterday, what it contained. It contained all sorts of articles that I did not find in my examination, water in holder tanks, general engineering, the drawings, gradings, curbings, sewering and other items of that kind. I forget just what that was yesterday. I gave it all in detail.

Q. If you were building a plant and had gotten in your estimates or bids from all the different contractors, you would then add this item of 10 per cent.?

A. I would, sir.

Q. Raise the amount of your bid to 10 per cent.?

A. Yes, sir.

Q. To cover such matters?

A. Yes.

Q. Is that for your services as engineer or is it to cover such contingencies as might arise in the course of construction?

1440 A. Both; it would cover everything.

Q. While you were chief engineer of Bartlett, Hayward & Company, did you add to your bids that you put in this item of 10 per cent.?

A. We did not make any contract for the entire plant in Astoria, This refers to an entire plant.

Q. I did not say Astoria particularly. I say, while you were preparing your bids, while you were connected with the firm of Bartlett, Hayward & Company, did you add this item of 10 per cent.?

A. Sometimes 10 per cent., sometimes 15, depending on the kind and character of the plant.

Q. And sometimes nothing?

A. No, never nothing.

Q. I understand that you estimated on this plant, as far as the buildings are concerned, the price that it would cost to build the buildings to-day?

A. Yes.

Q. And the depreciation which you have figured in each instance is the depreciation that the buildings in their present condition show, from a building recently completed?

A. Yes, sir.

Q. You did not figure what it would cost to put up these buildings in 1863?

A. I did not.

Q. And then figure how much they had depreciated from that cost?

A. I did not.

Q. Now, you added also another item of five per cent. What was that?

A. I think I explained that yesterday, that it is interest charges.

Q. Well, explain it again if you did.

A. It is for interest charges, for the construction of the plant; it takes about two years—not less than two years—to construct a plant of this size and we add interest on the total expenditures for one year.

Q. And you believe, in the cost of construction, that interest on the money invested should be added as a part of the cost of construction?

A. I do.

1441 Q. And should not be afterwards carried into the price or cost of manufacturing gas?

Mr. Mathewson: Is not that a conclusion which the witness has not testified respecting?

Mr. Page: I will withdraw that.

Q. Would that five per cent. be included in your estimate, or would it afterwards be charged up by the company against the cost of the plant?

A. No, by the company.

Q. And it would not be included in the estimate which you made?

A. No, sir.

Q. Did you also add the ten per cent. and the five per cent. to the cost of the apparatus, as well as to the cost of the buildings?

A. Yes, sir.

At 5.20 o'clock P. M. adjourned to to-morrow, Thursday, August 30th, at 11 o'clock A. M.

1442 UNITED STATES OF AMERICA,
Southern District of New York, ss:

I, John A. Shields, Clerk of the Circuit Court of the United States of America, for the Southern District of New York, in the Second Circuit, do hereby Certify that the foregoing (Vol. 2) pages, numbered from 719 to 1441 inclusive, contain a true and complete transcript of the record and proceedings had in said Court, in the cause entitled Consolidated Gas Company, Complainant, Appellee, against Julius M. Mayer, as Attorney General, *et al.*, Defendants-Appellants, as the same remain of record and on file in my office. (Vol. 2.)

In Testimony Whereof, I have caused the seal of the said Court to be hereunto affixed, at the City of New York, in the Southern District of New York, in the Second Circuit, this 15th day of May, in the year of our Lord One Thousand Nine Hundred and eight and of the Independence of the said United States the One Hundred and thirty-second.

[Seal of U. S. Circuit Court, South Dist. New York.]

JNO. A. SHIELDS, *Clerk.*

[Endorsed:] United States Circuit Court of Appeals for the Second Circuit. —— —— *vs.* —— ——. Transcript of Record from the Circuit Court of the United States for the Southern District of New York.

1443 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY, OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, THURSDAY, *August* 30, 1906—11.00 a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Meade, Mr. Page, Mr. Burr, Mr. Kirby.

U. S. Circuit Court, Southern District N. Y. Filed Jun- 24, 1907. John A. Shields, Clerk.

1444 **FREDERICK J. MAYER**, being further examined, testified as follows:

Cross-examination by Mr. PAGE (continued):

Q. I understand you desire to make some corrections in your testimony?

A. Yes, with regard to the 14th Street plant.

Q. Is it in the building or the apparatus?

A. In the apparatus. In transferring the figures from my original notes some decimal points were changed round in some instances.

Q. In the direct or cross-examination?

A. In the cross-examination.

By Mr. MATHEWSON:

Q. In the direct also?

A. Yes, in the totals, too.

Q. I did not ask as to individual items. Correction in those items would change the totals, of course.

A. Yes, I have them here; page 1431, in the instance of the brick tanks, for the two 250,000 cubic feet holders I gave the price yesterday as $573,838. It should have been $57,383. That is just misplacing a decimal point in transferring the figures. In the instance of apparatus contained in the engine room I gave the price for a jet photometer $650. It should be $65.00; and there should be also one additional photometer instead of two, making two items of $65 instead of one.

Q. Do you mean two items of $65 each, or two together of $65?

A. Two jet photometers at $65.

POOR COPY

Q. That is $130 instead of $650?
A. Yes, sir.

The MASTER: That is on page 1424.

1445 A. In the instance of contents of meter house I gave the price of two 16 by 13 meters as $1,600. This value should be $13,540.

The MASTER: That would seem to be at the bottom of page 1422. Two 16-feet diameter station meters. Is that the item?

The WITNESS: Yes. $13,540 for the two.

By Mr. PAGE:

Q. Here is another photometer here?
A. That is a Bar photometer. I was working up to the minute I began to give my testimony, and it is possible that there may be some other figures that I have not discovered.

By Mr. MATHEWSON:

Q. When you come to make a more careful comparison?
A. Yes, sir.

By Mr. PAGE:

Q. Turn to page 1429; there is another photometer there, right after where you give the item addendum No. 4. That price is right. That is a Bar photometer.

By Mr. MATHEWSON:

Q. That first item on page 1431, about the middle of the page, where it should be $57,383 instead of $573,838, that was the value of the two together, was it not?
A. Yes, two tanks.

By Mr. PAGE:

Q. Is that all?
A. Yes. Do you want the corresponding corrections for the totals?

Mr. MATHEWSON: Yes, give the totals.

1446 A. Total value of the 14th Street plant, including the above corrections, is $2,549,545, instead of $3,132,860.

Q. And the total valuation of all the plants will be correspondingly changed, of course?
A. I can give it to you if you want it.
Q. Yes, we might as well have it.
A. That would be without the 18th Street works, $15,532,489, instead of $16,098,893.
Q. And the total, including the 18th Street Works?
A. $17,040,524.
Q. In place of what?
A. In place of $17,606,928.
Q. In the description of apparatus which you have furnished us you begin with the valve house?

A. Yes, sir.

Q. Will you state what apparatus is contained in the valve house?

A. One 6-foot diameter by 2-foot-6 high governor; one cast iron manifold in conjunction with governor; in reality a combined governor and center valve; five floor stands or standards for valves.

Q. Do you value that as an entirety or in separate items?

A. Why, it is figured in detail, but the valuation is not entirely based on so many cents per pound as to what they weigh. This whole apparatus is in connection with each other. The combination forms really one apparatus.

Q. You take the weight then of an apparatus and multiply it by some figure?

A. By a unit price per pound.

Q. What is that unit price?

A. In this instance it is 5.6 cents.

Q. What do you get as the total cost at that rate?

A. $1497.

Q. And that is without depreciation?

A. Yes, sir.

Q. What depreciation do you figure?

A. $1198, equal to twenty per cent. deduction.

1447 Q. In estimating the value of the machine by weight you do not take into consideration its physical condition or efficiency, do you. In other words, a machine that is broken down and is all out of condition, will weigh just as much as a machine that is in thorough repair and operating at a high degree of efficiency, wouldn't it?

A. Yes, sir.

Q. On the market do you buy gas machinery by weight per pound?

A. Well, I have manufactured gas machinery and based my estimate on the pound price. All estimates are made that way.

Q. If you were going out into the market to buy a governor would you ask them at how much they would sell a governor per pound?

A. No, sir.

Q. There is a market price for these things, isn't there?

A. Yes, sir.

Q. And that market price is not arrived at by multiplying the weight by a price per pound?

A. No, sir; that is only in the instance of the governor; that does not refer to other things.

Q. No, we are talking about governors now. This machinery was placed in this valve house in 1863, wasn't it?

A. 1863, yes, sir.

Q. And has probably been in operation ever since?

A. Yes, sir.

Q. The price that you have given, $1198, that would be for a governor bought to-day, wouldn't it?

A. No, sir; that same governor bought to-day would be $1,497.

Q. Well, would $1497 be the price you would pay for that same governor new with the connections and fittings that you have specified here?

POOR COPY

A. Yes, sir. That would be an exceedingly low price for it.

Q. Whose manufacture is this particular governor, do you know?

A. Morris & Tasker.

Q. Are they still in business?

A. No, sir.

Q. How long since they went out of business?

A. Oh, I think all of 12 or 15 years.

1448 Q. Now we will pass on the purifier house. Will you state how many purifier boxes there are and give a description of them?

A. There are 8 boxes 20 feet by 22 feet by 3 feet deep inside and 24 inches deep by 4 inches wide cups; two layers of trays; 8 wrought iron covers and the necessary supports.

Q. Did you value those separately or did you value them with the covers?

A. With the covers and supports complete.

Q. Will you state what the size of the covers is?

A. 20 feet by 22 feet. Well, they are for those boxes—they are about 20 feet 3 inches by 22 feet 3 inches by 3 feet 6 inches deep on the sides.

Q. And the method of estimating the purifier apparatus, did you arrive at that by taking the weight?

A. I did.

Q. And multiplying it by 5.6 cents, the same unit as you used before?

A. Yes, sir.

Q. And proceeding in that manner what was your result?

A. $37,840 without depreciation and $35,948 with depreciation.

Q. Do you know when this apparatus was put into the purifying house?

A. 1863.

Q. And you figure that in that length of time it has depreciated 5 per cent.

A. Yes, sir. There is practically no depreciation except on the sides of the covers. The purifiers are as good to-day as ever.

Q. As you explained in regard to the 14th Street property, that was taken care of by repairs?

A. Yes, sir.

Q. Is the purifying apparatus sold by weight?

A. It costs by weight.

Q. In am speaking about when a man buys it. Of course any manufacturer makes his estimate on the weight very largely.

A. It is sold by a lump sum; a contract price.

1449 Q. And you have not stated the price here for purifying apparatus that you have obtained by asking estimates from various manufacturers of that apparatus?

A. I have not. It is my own estimte.

Q. It is your own estimate, based on that rate per pound?

A. Yes, sir. Estimated in detail, each factor in detail to make up that 5.6 cents per pound.

Q. And the apparatus was not weighed by you, but the weights were estimated?

A. The weights were estimated.

Q. So to arrive at the value of this particular plant you estimated the weight, estimated the unit, and multiplied the two together to produce a result?

A. Yes, sir.

Q. Now proceed with the next item?

A. Four additional purifiers, 16 feet by 27 feet by 3 feet 6 inches deep, with 24 inch by 4 inch cups, together with supports and covers and trays.

Q. And did you also take into consideration, in giving an estimate, the covers?

A. Yes, sir; I mentioned the covers.

Q. Oh, did you? Excuse me. And in estimating the weight of that apparatus and multiplying it by 5.6 cents as before, what result did you produce?

A. $18,576 without depreciation, and $17,648 with depreciation.

Q. Do you know whether these purifiers have been in use since 1868 or not?

A. I do not.

Q. You do not know how long those have been in use?

A. No, sir; I do not.

Q. What else have you?

A. Four small purifiers, 7 feet 6 inches by 10 feet 6 inches by 3 feet deep, with covers and supports, valued at $3,308 without depreciation, and $3,142 with depreciation.

Q. The result being arrived at in the same way that you stated before?

A. The same method, yes, sir.

Q. What is the capacity of this purifying apparatus?

1450 A. The total of all the purifiers is equal to the capacity of the plant.

Q. How do you arrive at that?

A. In proportion to the number of benches and other apparatus in the entire plant making up the total capacity of the plant. If such was not the case they could not purify the gas. We know the gas is purified.

Q. Is there more of a purifying capacity here than the total capacity of the plant?

A. That may be the case; I have not figured it in detail. There certainly is not less than the capacity of the plant.

Q. You have some small items, haven't you?

A. Not in the purifying house. Oh, yes, there is another purifying house:

Two hydraulic floor carriages, that is for the 20 foot by 22 foot purifiers, $1,400;

One hand power floor carriage for the 16 by 27 purifiers, $523.

One hand power floor carriage for the 7 foot 6 inch by 10 foot 6 inch boxes, $280.

Oxide barrows, tools, etc., not valued, included in the final 10 per cent. All these prices I am giving are always without the 10 per

POOR COPY

cent. and the 5 per cent interest charges, of course. Those would have to be added in each instance given to the totals.

Q. I understand; you do that when you get through?

A. Yes, sir.

Q. And those hand barrows and hydraulic floor carriages were all estimated in the same way that the balance of the purifying apparatus was?

A. Yes, sir.

Q. The same unit was used?

A. Yes, sir.

Q. Now proceed.

A. These units are based upon the actual cost figures, of which I have intimate knowledge.

Q. Proceed.

A. The next is the engine and meter house. The first is item No. 13 of the addenda in this house:

1451 One 48 by 48 McKenzie exhauster, with 12 inch by 24 inch horizontal engines; one Huntoon governor, complete, $3,400 without depreciation; $3,230 with depreciation.

Q. Do you know when that engine was put in the property?

A. No, sir, I do not; but it is in a thoroughly good condition. It is working every day.

Q. How did you arrive at this value that you gave? Do you weigh the engine and multiply it by some figure?

A. No, sir, I took the prices of the engines and the exhausters from the manufacturers.

Q. Is that the list price that you put in?

A. That is the price delivered and erected.

Q. Proceed.

A. One 13 foot 6 inch cast iron station meter, valued, without depreciation, at $5,800; one 11 foot 6 inch meter valued at $4,800, and one 10 foot 6 inch meter valued at $3,800. The total sum for the three meters, including depreciation, is $10,875.

By Mr. **Mathewson**:

Q. Is that total right?

A. With depreciation for the three meters.

Q. How much depreciation?

A. 25 per cent. In this instance it is due to the old style drums contained in these meters, instead of the new style.

By Mr. **Page**:

Q. These meters were put in at what time?

A. 1882 and 1888.

Q. What is the depreciation item for? Is it for a reduced efficiency of the meter?

A. On account of the old style drums; old drums instead of new drums that are being built now. I think it is a question of a very few years when these drums will have to be replaced with new drums.

1452 Q. Therefore, in allowing the value here you allowed for the replacing of the drums?

A. Yes, sir, twenty-five per cent. of the total cost.

Q. Now, proceed with the contents of the engine meter house.

A. There is one additional meter in another small meter house located alongside of the holders which is not included in the contents of this meter house and I have added under the addenda, item No. 13½, an 8 foot by 8 foot station meter; $3,000 without depreciation; $2700 with depreciation. That is item No. 13½.

Q. Now, we come to the retort house.

A. 60 benches of 6's and three stacks; total value without depreciation, $180,000; with depreciation, $171,000. To this must be added the item in addenda, No. 15, on account of the deep furnace and the new settings there must be added to each bench $500, I think it is.

Mr. Mathewson: Yes, item No. 15.

The Witness (Continuing): $500 for each bench.

Q. That would make then for the sixty benches, thirty thousand dollars?

A. Yes, sir, additional thirty thousand dollars for the sixty benches without depreciation, and $28,500 with depreciation.

Q. That makes the value of the benches without depreciation $210,000?

A. Yes, sir.

Q. Without depreciation?

A. Yes, sir.

Q. And with depreciation how much?

A. $199,500.

Q. The size of these retorts was given as 14 inches by 24?

A. Yes, sir.

Q. And the setting 9 feet deep; what does that mean?

A. That is the depth of the regenerator furnace from the floor line.

Q. What is the length of the retort?

A. That means the length of the retorts. Nine feet deep means the length inside the arch.

1453 Q. What do you mean by regenerative type, 60 benches of 6's and 6 blocks of regenerative type?

A. That refers to the style of furnace applied under the benches, which in this instance is of great depth, I think it is 9 or 10 feet and contains recuperative flues to heat the secondary air required for the combustion in the benches.

Q. That increases, d[illegible]'t it, the efficiency of the retort very much?

A. Yes, sir.

Q. And by having the recuperative flues——

A. I beg pardon, not the efficiency of the retort, but the fuel consumption.

Q. Well, what I mean by that, for a less amount of fuel you can carbonize a greater amount of coal?

A. Yes, sir.

POOR COPY

Mr. MATHEWSON: With the same amount of fuel you can carbonize a greater amount of coal.

Mr. PAGE: Well, either would be correct.

Mr. MATHEWSON: You might within certain limits.

Q. As comparing this particular retort house with the retort house at 14th Street, how much more efficient are these retorts than those at 14th Street?

A. In 14th Street I think there are some one-fourth depth benches, some half depth benches and these are full depth benches. Of the three, these would give the best results, as far as fuel consumption is concerned.

Q. That is an important item in the manufacture of gas, isn't it?

A. Yes, sir.

Q. What condition are these benches in?

A. Perfect condition.

Q. Do you know when they were put in?

A. The arches, in 1863; they had been rebuilt since that 1454 time; and the settings have been renewed many times.

Q. When were they rebuilt?

A. The settings, approximately every three years.

Q. I know that, but you said that the arches had been rebuilt or the apparatus had been rebuilt since then?

A. I have not got the date of rebuilding the arches; they were rebuilt at several times.

Q. You do not refer to the entire apparatus when you say it has been rebuilt; you refer to this refilling, is that what you mean?

A. I refer to the refilling and rebuilding of the arches.

Q. The refilling is taken care of as an ordinary repair made necessary by wear and tear?

A. Yes, sir.

Q .How about the rebuilding of the arches, is that the same?

A. No, that probably does not occur but once in perhaps 20 years, 25 years in some instances.

Q. But this apparatus is in perfect condition to-day, you say?

A. Yes, sir.

Q. And do you allow something for depreciation?

A. 5 per cent.

Q. Well, why, if the apparatus is in perfect condition?

A. Because the arches are older in proportion to what the settings are. The settings are being reset now, a part of it is entirely new, alreeady in operation and the balance is being rest at the present time.

Q. I notice the retorts here are 14 inches by 24 inches, while the retorts, or a large number of them, at 14th Street are 12 inches by 21 inches.

A. Yes, sir.

Q. Is this a better retort, 14 inches by 24 inches—will it produce better results than a 12 inch by 21 inch retort?

A. No, sir, the results are the same.

1455 Q. Well, the results are gas, of course; but I mean can you produce gas cheaper in a retort of this size than you can in the other?

A. No. The charges of coal in smaller retorts are less than those in the larger, and the fuel consumption is correspondingly less, so there is no difference.

Q. Well, to produce the same number of thousand cubic feet of gas you have to charge a small retort more frequently—that is, more times—to produce the same number of thousand cubic feet, than in the other?

A. In an indirect way you do. You do not charge the same retort oftener, but you have more retorts, and with the large retorts you produce the same amount of gas; in other words, you charge more retorts in the same space of time, but not oftener.

Q. It takes just as long firing to carbonize in a large retort as it does in a small retort?

A. Yes.

Q. Now proceed with the condenser and scrubber house.

A. Condenser and scrubber house:

Two cast iron scrubbers, 8 feet diameter, 18 feet height, $1,560, without depreciation, and $1,482 with depreciation.

Q. Is this each, or the value of both together?

A. That is only for one, and item No. 16 is the addenda; the item is explained that it should be doubled, therefore there are two scrubbers, each of the same amount.

Q. How did you arrive at the value you give on the main sheet of your paper that you are answering from of two scrubbers of 24,000 pounds, multiplied by 6.5 cents a pound.

A. 6.5 cents a pound forms a figure composed of the following units——

Q. No, I do not mean that; I say how do you get at your 24,000 pounds?

A. That is estimated from the size of the apparatus.

Q. That is the two scrubbers would weigh——

A. 48,000 pounds.

1456 Q. Well, you had the two scrubbers before you when you made the estimate of 24,000 pounds; you knew there were two scrubbers.

A. The estimate is made on the basis of one scrubber, and in the schedule multiplied by the number of apparatus, and in this instance was overlooked, and the weight put down for one instead of two. That I did not find until after I went to the works after all my schedule was made, to make a final examination, and then I discovered that error and added it to the addenda.

Q. Then you knew there were the two scrubbers there?

A. Yes.

Q. Now proceed with the condenser.

A. Two scrubbers are in my original notes, but in transferring it on the schedule we transferred one instead of two.

Q. Those two scrubbers have been there since 1863, haven't they?

POOR COPY

A. Yes, sir. One wrought iron tubular condenser; value, without depreciation, $17,220, with depreciation, $16,359.

Q. Is that a water condenser?

A. Yes, sir.

Q. Do you know when that was erected?

A. 1863.

Q. How did you arrive at the value?

A. By multiplying the weight by the unit part of 8.4 cents per pound.

Q. Proceed.

A. One air condenser, without depreciation, $11,607, with depreciation, $11,027.

Q. Was that also estimated by weight?

A. It was.

Q. And what is the unit of weight there?

A. The unit of price, do you mean?

Q. Yes.

A. 7.3 cents a pound.

Q. Proceed.

A. One cast iron box 7 feet 6 inches by 5 feet 6 inches by 9 feet deep, $633; no depreciation.

Retort house Nos. 2 and 3.

Q. This box was an estimated weight at an estimated price, was it?

A. Yes, sir.

Q. What is your estimated price per pound?

A. 4.5 cents a pound.

1457 Q. Proceed.

A. Retort house- Nos. 2 and 3, 6 benches of 6's, $18,000; 14 benches of 6's, $30,940, making a total for the above benches, $48,940, without depreciation; with depreciation, $46,493; 1 range of 20 benches of 7's, $65,000, without depreciation; $61,750 with depreciation.

Q. Building in benches of 7's is an improvement, isn't it, on building in benches of 6's?

A. Well, it depends upon the space you have at your disposal; I cannot call it exactly an improvement.

Q. Well, if you have a whole block to lay out your plant in—that is, I mean it produces better results and more economical results.

A. Yes, in the manner I have described before.

Q. And if you were building a plant to-day and had the room that they have in these 14th Street and 42d Street plants, you would probably put it up in benches of 7's.

A. If I would build the plant for the total capacity at once, I should; but if I should start the plant with probably one-half of the capacity as this was done, I should not.

Q. Yes, I am talking about the plant, if you should put it up today. You say then you would?

A. For the total capacity I should put in larger benches.

By Mr. **Mathewson**:

Q. Built at one time?

A. At one time.

By Mr. **Page**:

Q. How much larger?

A. For a plant of this size I should put in benches of 8's.

Q. Go on, Mr. Mayer.

A. There is one item in the addenda No. 17 which goes into this building $500 must be added to each bench for the same reason as given in retort house No. 1.

1458 By Mr. **Mathewson**:

Q. These are deep regenerative furnaces, aren't they, all these in this retort house?

A. Not all, no.

Mr. **Page**: 14 benches are direct fire.

Mr. **Mathewson**: All except the 14 benches?

The **Witness**: Yes, that adds $3,000 without depreciation and $2,850 with depreciation.

Q. To which item?

A. To the 6 benches, the deep regenerative furnaces, the first item in the schedule.

By Mr. **Page**:

Q. You add how much to each bench?

A. $500, $3,000 for the six.

By Mr. **Mathewson**:

Q. Nothing for the fourteen?

A. No, sir; they are direct fire.

Q. How about the twenty benches of sevens? They are deep regenerative furnaces?

A. There is no addition to those; they are figured at $3,250 per bench.

By Mr. **Page**:

Q. What else have you in this retort house?

A. Nothing else in this retort house. The next is the Exhauster and engine house.

Q. Proceed.

A. One 8 by 8-inch Greenfield Engine, $1,625 without depreciation, $1,219 with depreciation; two large Mackenzie exhausters, $3,400 without depreciation, $2,550 with depreciation; one 16-inch by 30-inch horizontal engine, $3,200 without depreciation, $2,400 with depreciation; one 8-inch by 8-inch Greenfield engine, $425 without depreciation, $319 with depreciation; one 8-foot by 16-foot washer, $6,860 without depreciation, $5,145 with depreciation; one 10-inch by 10-inch Greenfield engine, $550 without depreciation, $413 with depreciation; one Eclipse washer, $5,488 without depreciation, and $4,116 with depreciation; 1459 one tubular condenser, $4,900 without depreciation, $3,675 with depreciation.

Q. Give the number of tubes 42-6 by 5?

A. It contains 576 5-inch diameter cast iron tubes. My first depreciation on all that apparatus named for the exhauster and engine house was 25 per cent. But upon another examination, after the completion of the schedule, I found that the depreciation should only be 5 per cent., for the reason that all the apparatus is in perfect working condition; that makes an addition of $5,281 to the values of the apparatus in that house. I wish to state that these little differences occurred in going back and forth to the works, because I could not grasp all the thing at one time, and while my men were working taking measurements at the works I was working on my unit figures to apply to the cost, and I had to go back there, and found the condition to be different than what I had assumed at first.

Q. You have got some oil gas scrubbers in here?

A. In this building?

Q. Those you have in this schedule you have given me. Two oil gas scrubbers.

A. Two oil gas scrubbers. They were given at $436 for two, without depreciation, and $327 with depreciation. That should be corrected as per item 19 in addenda. There should be added $734 without depreciation, and $698 with depreciation.

Q. Is that to be added to the other?

A. That is to be added to the other; yes, sir.

Q. There is one scrubber valued at $436 and another scrubber valued at $734?

A. No, the scrubbers weighed 18,000 pounds instead of 6,703 pounds, making a difference of 11,297 pounds in the weight,
1460 which I discovered on remeasuring the apparatus.

A. And on a remeasurement and estimate of weight you found that you had made a mistake before, and then you multiplied this result by how much?

A. By 6.5 cents, the same price that was applied to the weight that was too small.

Q. Proceed now with the other oil gas condensers.

A. One cast iron oil gas condenser, without depreciation, $1,512; with depreciation, $1,134. These prices should be changed as per item No. 20 of the addenda, by adding $303 to the price, including depreciation.

Q. That is, that price should be $1,437 instead of $1,134?

A. $1,437.

Q. On a re-examination you found it was not depreciated as badly as you thought it had been?

A. No, sir; as I said before, I could not establish those facts until I went back and forth repeatedly to the various works during the time my men were taking the measurements, because it was impossible for me to grasp the condition of all the apparatus on the first examination, and I did not want to go back and make an entirely new schedule, as the time was too short, and I made these addenda.

Q. We have another retort house, No. 4.

A. Retort house No. 4, four benches of sixes.

Q. If you have any corrections to make, probably you had better make them now.

A. Right away?

Q. Yes, unless you prefer to give it the other way.

A. I can make the corrections. Value, without depreciation, $14,000, and with depreciation, $13,300, which includes the item No. 20½ referred to in the addenda.

Q. What do you mean by "entirely disconnected except arches?"

A. I found that all the settings had been torn out, and on my second visit I found that new settings had been delivered at the grounds and they were going to put them in; they were getting the arches ready for repairs. I thought at first they had been abandoned. 1461

Q. Now, the values?

A. One small steam drip pump, $84; no depreciation. Two continental boilers, 60-H. P. I will give this and give the deductions afterwards. $12,000 without depreciation, $10,800 with depreciation.

By Mr. **Burr**:

Q. That is for both boilers?

A. For both boilers.

Breeching and steel stack, $475 without depreciation, $428 with depreciation; one Continental boiler, 105-H. P., $5,100 without depreciation, $4,590 with depreciation. Breeching and stack for same, $475 without depreciation, $428 with. Two small boiler feed pumps, $176 without depreciation, $158 with. One Knowles Air compressor, $700 without depreciation, $630 with depreciation.

By Mr. **Page**:

Q. Before we proceed, I notice that you value a 60-H. P. boiler at $6,000 and a 105-H. P. boiler at $5,100.

A. Yes. I say I correct that afterwards in the addenda.

Two feed water heaters, $600 without depreciation, $540 with.

One 8 x 8 Greenfield engine, $365 without, $324 with.

One vertical drill press, $100 without depreciation, $80 with.

One pipe cutter, $425 without depreciation, $340 with.

One bench lathe, $50 without depreciation, $40 with.

Mr. **Page**: Can he not lump those small items?

Mr. **Mathewson**: If you do not want the values of them why not let him say simply, bench lathe, grindstone, &c.? 1462

Mr. **Page**: They are small items, I do not think we ought to waste time on them. Just state what they are.

A. Grindstone, two brick forges, two anvils, one sledge block, one hand shear, one hand punch, one bench, one portable forge, five 100-gallon oil tanks, one 50-gallon oil tank, blacksmith's tools, wooden benches, bench vises. Those latter items, the tools, come out, they are taken off of the ten per cent. addition to the end of the schedule. As I said before, 10 per cent. has been omitted from all

POOR COPY

those figures. There should be deducted from the total sum of the boilers $10,025, including depreciation.

Q. On this Continental 60-H. P. boiler, or the three?

A. On the total sum of the three boilers.

Q. Why did you make that deduction?

A. It was a mistake in the first calculation.

Q. What mistake was made in the first calculation?

A. The first two boilers should cost —without depreciation, instead of $12,000 without depreciation, and the third boiler should cost $2,730 instead of $5,100 without depreciation.

By Mr. **Mathewson**:

Q. How much with depreciation; did you figure that out?

A. I gave the total just now; with depreciation $5,265 for the three boilers.

By Mr. **Page**:

Q. Then you were right in your original assumption that a 105-H. P. boiler 7 by 12 would cost more than a 60-H. P. boiler 5 feet 6 inches by 12, were you? Deducting your $6,240 from $12,000 you get $5,760; divide that by two is $2,880 as the price of the
1463 60-H. P. boiler, while you give the price of a 105-H. P. boiler as $2,730. Is that right?

A. The price for the two boilers of 60-H. P. each should be $3,120 without depreciation, and the price for the one boiler 7 feet in diameter should be $2,730 without depreciation.

Q. Therefore instead of $12,000 as the value of those two boilers it should be $3,120.

A. Yes.

Q. How do you arrive at the value of those boilers?

A. Those prices I got from the Continental Iron Works.

Q. Proceed.

A. Carpenter shop, total contents, $1,500, which includes items in addenda No. 22.

Q. How much do you make it?

A. $1,500.

Q. Without depreciation?

A. Yes.

Q. And with depreciation how much?

A. $1,425 with depreciation.

Q. You can take the coke storage yard in the same way.

A. Coke storage yard, total value $1,510 without depreciation, $1,323 with depreciation. Tanks and scales, total value without depreciation $1,226, with depreciation $1187.

Q. How do you get the value of that?

A. I got that from the companies that furnished the scales.

Q. Do you take their list price?

A. No, I telephoned for a price for the scales to be delivered and erected in New York City.

Q. Proceed.

A. Water meters, $100; no depreciation. Coal in storage not included in plant. Coal hoisting apparatus, total price of all machinery, $55,000 without, $52,250 with.

Q. Now, in adding this $20,000 to the original estimate of value, what is the reason for that? Why did you add it?

A. Because of a correction of the figures given by the people that furnished the apparatus. They gave me first $35,000 and omitted the grab bucket and the hoisting rigging at the dock, the
1464 hoisting engine, etc. In their first price they included only the railways and transporting machinery for the coal, but no hoisting machinery.

Oil in tar storage:

Two wrought iron tanks, 9 feet diameter, 30 feet long, $2,075 without depreciation, $1,868 with.

Eight wrought iron tanks, 8 feet diameter, 25 feet long, $6,014 without depreciation, $5,714 with.

One wrought iron tank, 30 feet diameter, 21 feet long, $3,302; no depreciation.

One wooden tank, 30 feet diameter, 15 feet 6 inches high, $540.

Piles under wooden tank, $650.

Wrought iron tanks, 5 feet diameter, 25 feet long, $437 without depreciation, $415 with.

One wooden well, 20 by 25 by 8 feet deep, $256 without depreciation, $230 with.

One wooden well, 20 by 20 by 8, $166 without depreciation, $150 with.

One wooden well, 18 feet 7 inches by 7 feet 6 inches by 8 feet, $437 without, $415 with.

Piles under wooden tanks, $576 without depreciation, $519 with. The depreciation for piles in this instance is due to the fact that the piles are above the water line and show the least signs of decay right above the ground. If piles are above the water line I figure no depreciation. I make that explanation so that you will understand it when I say there is no depreciation on any foundations.

Q. Have you got the price of wrought iron tank, 12 by 12? Is that omitted?

A. Yes, it is omitted.

Now, under the total there is an item, $25, which adds to the price, with depreciation, $4,364, for lead lining in all of the wooden tanks, that I did not discover until a subsequent visit to the works.

Q. In arriving at the valuation that you have given for
1465 these wrought iron tanks, did you proceed as before, by weight?

A. Yes.

Q. And what unit of value did you take?

A. 6¾ cents per pound.

Here a recess was taken until 2:15 P. M.

After Recess.

By Mr. PAGE:

Q. Is there some correction you wish to make?

A. Yes, sir; I want to insert item No. 14 under the heading of engine, meter house and office. The depreciation was changed from 25 per cent. to 5 per cent. under that item 14 on account of the meters having been provided with new drums in 1892 for the 13 foot 6 inch meter, and the drums which were placed in place in 1882 at that time were provided with new partitions.

By Mr. **Mathewson**:

Q. When you made the 25 per cent. estimate did you assume that the drums were the same as were put in when the meter was manufactured originally?

A. Yes, sir.

Q. And you found subsequently that that was not the case, but new drums had been substituted?

A. New drums had been supplied; yes, sir.

Q. What would that item be?

A. That adds an item, including depreciation, of $2,805.

Q. What would it be then, the value as you now figure it, including depreciation? Oh, those were the three engines under heading of meter, engine house and office?

A. Yes, sir. It would make a total item of $13,680, instead of $10,875.

1466 By Mr. **Page**:

Q. Is there anything else you wish to add?

A. Have I item No. 26 in the addenda?

Q. No, I don't think so.

A. I think the last we had was the lead lining for wooden tanks?

Q. Yes.

A. And there was one additional item, No. 26, in the addenda for one cast iron purifier, 30 feet by 20 feet by 3 feet deep, with wrought iron cover and hoisting crane, located in the deodorizer house; total value, $4,760 without depreciation; $3,332 with depreciation.

Q. Why do you take off a 30 per cent. depreciation there?

A. That was a purifier which was located on the dock, and is not in as good condition as were the rest of the purifiers used to purify for carbonic acid and sulphur. This purifier was erected, I understand, for the purpose of relieving the works of any smell, of which complaint was made by the Health Department, and has not been kept in as good condition as the rest of the plant?

Q. Is it used?

A. Yes, sir. It was not in a good condition. The sides are rusted, the cover tops are rusted.

By Mr. **Mathewson**:

Q. Let me ask you for clearness, whether all these items in the addenda which you are dealing with have been taken into account in making up the totals to which you have testified?

A. Yes, sir.

Q. So they are all included in the totals?

A. Yes, sir.

Q. They are not changes?

A. There are no changes in the totals except for the corrections as we found them going along, giving the changes, such as I made this morning, for instance.

Q. Is that true of all these schedules for the other plants also?

A. Yes, sir.

1467 By Mr. **Page**:

Q. This completes the apparatus of the Consolidated Gas Company that is used for the manufacture of coal gas?

A. Yes, sir.

Q. At these two stations, 14th Street and 42nd Street?

A. Yes, sir.

Q. In giving the capacity of the plants at 14th Street as 5,000,000 cubic feet per day and at 42d Street as 4,500,000 cubic feet a day, did you take that as the maximum daily capacity?

A. Yes, sir.

Q. Could you run works at that maximum daily capacity?

A. Yes, sir.

Q. Could you run works at that maximum daily capacity for any length of time?

A. Continuously.

Q. What candle power gas did you estimate would go through these works at this capacity? Just the ordinary coal gas as it is produced, is that it?

A. Yes, sir.

Q. Then you would add to the total capacity of the works, would you, the oil gas that is added as enricher?

A. Yes, sir.

Q. Are all parts of the two stations up to that full capacity?

A. Yes, sir.

Q. That is, the retorts, purifiers and condensers?

A. The entire apparatus is that capacity.

Q. And you could run it at that capacity during the period of the highest demand?

A. Yes, sir.

Q. In the winter months?

A. Yes, sir.

Q. All through the month of December?

A. Yes, sir, or longer, if necessary.

Mr. **Mathewson**: I do not think the witness is a gas maker, or an expert in the particular line in which the Senator is questioning him, but whatever he says, for what it is worth, I have not objected. He is not a gas manufacturer.

Mr. **Kirby**: It is not what the works do. It is the apparatus there, with which he seems to be familiar. 1468

Mr. **Mathewson**: There are a good many other things though, such as shutting down for repairs, &c.

Q. Now in the various buildings that you appraised, are all of them in actual use now for the manufacturing purposes of the plant?

A. Naturally.

Q. How about the apparatus?

A. All in use.

POOR COPY

Q. There is nothing upon this appraisal that you have given here that is not in actual use to-day in the plant?

A. No, sir.

Q. Now as I understand, you did not make your appraisal by finding out how much this property actually cost the company and then making an allowance for depreciation?

A. No, sir, I never saw any figures of that kind.

Q. Is it your idea that gas-making machinery by use enhances in value?

A. Some of them do, yes, sir.

Q. What particular part of the gas machinery becomes more valuable by use?

A. Well, for instance, water gas generating apparatus.

Q. We are talking about the coal gas stations?

A. Oh, particularly about coal gas? You want nothing except new engines, exhausters and apparatus of that kind. Those which have moving parts, they are better operated after they have been submitted to some wear and tear and have the proper bearing and do not heat and do not bind.

Q. Well, you mean by that that any machine when it is first operated is stiff and does not give its maximum capacity?

A. Yes, sir.

Q. But if it is run for a few weeks and has "found itself," as they express it, I believe, then does it continue to increase in value?

A. No, it does not increase its value, but it maintains its
1469 value.

Q. Then if it should appear that this very apparatus cost the company very much less than these estimates which you have given would you change your estimate or your appraisal at all?

A. No, sir, I would not.

Q. Why not?

A. My estimates are based upon my own personal knowledge of these matters for a good many years and therefore I cannot be wrong.

Q. And therefore if the company actually paid less you think the company must have been wrong?

A. Well, I don't know how they established their selling prices, but my values are based upon actual facts as they exist to-day.

Q. Then, as I understand it, you are not attempting to find the capital of the company that was invested in the plant, but what someone would have to pay if they got you to build them a plant somewhat similar to this to-day, is that it?

A. That is the idea exactly, with the exception that it would be an exact duplicate of the plant as it exists to-day.

Q. If, however, you were going to build a coal gas plant to-day of a capacity of 9,500,000 cubic feet per day, would you reproduce this identical plant?

A. I would not.

Q. You could not buy in the open market to-day, could you, all the apparatus that is used in these plants?

A. With a few exceptions, yes.

Q. There is nothing appearing in your testimony, nor have you any knowledge, of how much of this plant came to the Consolidated Gas Company at the time of its consolidation in 1884?

A. No, I know nothing about it.

Q. And don't you know what particular portions of the plant have been added since that time?

1470 A. No, I do not. That is I mean to say I do not know at the present time. I have been figuring on the work myself for some years, but I cannot state just now what they are.

Q. The additions that you have made yourself to the plant of the Consolidated Gas Company have been made to the 14th and 42d Streets, or to the water gas stations?

A. I made some in 42d Street, I believe, and a few apparatuses in the 14th Street; I think some at 21st Street—I don't recall exactly all the works now. There are other stations which I don't recall at the present moment.

Q. In making this appraisal, did you state the actual amount received by you for making these additions?

A. No, sir.

Q. Did you take a larger or smaller amount?

A. That I can't tell, because I did not refer to the figures which they received at all.

Q. Well, then, as I understand it, this valuation of yours is not the valuation of this plant as it exists, but you have taken a mental picture of the plant and estimated what it would cost you to reproduce such a plant to-day, and have made a mental estimation of the weight of such a plant and multiplied it by some other figure to produce the appraisals that you have presented here to-day?

Mr. Mathewson: I object to one portion of that question as a conclusion. The Senator states he has not taken the value of the plant. It is our contention that the value of that plant is what it would cost to reproduce the plant to-day. It causes the witness to discriminate in a matter of law, which he is not competent to do.

Mr. Page: That may go to the weight.

The Master: I think he may answer it. It is proper on cross-examination. That is, if he can answer.

1471 A. If you mean by the mental picture of the plant a careful, personal examination of the same then you are correct. I have based my valuations upon a careful, personal examination and estimated each and every item in detail of what that value would be to-day if I were asked to build a new plant.

By Mr. Mathewson:

Q. Less depreciation that has accrued?

A. Yes, except when depreciation is mentioned.

By Mr. Page:

Q. You mean by that that you take first what it would cost you to build a similar plant to-day, and then from that standard you figure off a certain percentage for depreciation, that amount being the amount that the property in its present condition has depre-

POOR COPY

ciated from the standard which you would establish as a thing which you would produce to-day, is that so?

A. As absolutely new apparatus, yes.

Q. Yes. As absolutely new apparatus?

A. Yes.

Q. I understand that if you were to produce a plant to-day which would produce the results that this plant does, that you would not build this kind of a plant; is that right?

A. Not if I were asked to build a plant with the total maximum capacity as it exists to-day.

Q. And you could build such a plant cheaper could you not than the estimate which you have given?

A. No, it would cost more, but it would be better. It would include a great many apparatus which these plants do not include.

Q. But your result in the cost of gas produced at that plant would be very much less, wouldn't it?

A. Yes.

Q. Take merely the item of the number of retorts to a bench and the size of the retorts; you have stated that it would take less 1472 fuel per hundred pounds of coal carbonized in the larger retorts and more retorts to the bench, and you would make a saving that way?

A. Provided you compare the benches of the new plants of the same type with the benches in the existing plant.

Q. Yes.

A. That is, if you compare benches of both plants with full depth regenerating furnaces, one with the other, or benches without any regenerating furnaces, one with the other.

Q. Well, you would not manufacture to-day a bench without regenerating furnaces, would you?

A. I would not.

Q. Now, as to the item of labor, don't you save on labor by having the modern bench where there are more retorts to the bench and larger retorts than you would upon the old-fashioned bench that is used in these 42d and 14th Street plants?

A. The difference would be very slight when you apply machinery, when you apply stoking and drawing machinery and work the same to the full capacity of the machines, then you save in one instance as much as you would in the other almost.

Q. Now you have stoking and drawing machines at 14th Street?

A. Yes, sir.

Q. But you have not in 42d Street?

A. No, sir.

Q. Now, the inclined retort takes even less fuel, doesn't it than the horizontal retort?

A. That is not due to the location of the retort, it is due, as I said before, to the furnace applied under the retort settles; if you have the same depth of furnace under the inclined retort as you have under the horizontal retort, then the fuel consumed in both would be alike.

Q. Yes, but they do not, do they?

A. They do. There are many instances where the heating surface in the inclined was absolutely the same as the horizontal, both styles of retorts being of the same length.

1473 Q. Is that so in the inclined retort house at Astoria?

A. That is the case, yes, sir.

Q. That it was the same depth and the same heating surface?

A. Approximately. I don't know the exact dimensions, but I think that the horizontal retorts have approximately the same cross-sectional dimensions as the inclined retorts.

Mr. Mathewson: As a matter of fact, we have both horizontal and inclined.

Mr. Page: I know, but I am talking about the inclined retort house, as I say.

Mr. Mathewson: We have installed both kinds at Astoria, and don't know which will be the best.

Mr. Page: I limited my question to the inclined retort house.

The Witness: There is no difference where the heating surface of the retorts is the same in both cases and the same method of heating is applied.

Q. Now, in arriving at the prices for some of your materials here you say you applied to the manufacturers and got estimates from them?

A. In such apparatus which are of standard makes and in the instance of retort benches.

Q. That was to be installed, wasn't it, the plant installed?

A. And brick work installed complete, to which I added my iron work, in the instance of benches, at my own valuation and my own estimate.

Q. Would not the contractor add 10 per cent. for engineering in his estimate?

A. Undoubtedly, for his own work, in each and every instance.

Mr. Mathewson: But that would not dispose of the supervision of our own engineers.

The Witness: But that 10 per cent. added on the end 1474 would not affect the other 10 per cent. That is an entirely different percentage.

Q. Then on any apparatus that would be furnished by contractors there would be 20 per cent., would there for engineering?

A. No, sir, the contractor would only add 10 per cent. for his own shop cost, operating expenses, wear and tear of plant, &c., while the 10 per cent. which is added to the end of these estimates is for expenses which the gas company would have in addition to the cost which they paid the manufacturer for the apparatus, for their own engineering costs.

Q. Well, then, as I understand it, if you went to a contractor who gave you a bid on an apparatus that would cost him $10,000 and he would add 10 per cent., which would be $1,000, you would put that in this estimate and add another 10 per cent. to the $11,000 in getting at your estimate of price or of cost?

A. Exactly.

POOR COPY

By Mr. **Mathewson**:

Q. Would not his 10 per cent. be in his own estimate or bid?

A. The first 10 per cent. would be in his own bid or estimate.

Q. You would not put it in?

A. No, I only put in one ten per cent. to his bid.

By Mr. **Page**:

Q. But you would take his figure at $11,000, put that in, and add your ten per cent. to it, wouldn't you?

A. I would.

By Mr. **Mathewson**:

Q. You mean to say that if his bid or estimate was ten thousand dollars you would add one thousand dollars to that for his bid?

1475 A. No, for the general engineering of the plant that ten per cent. is created by the gas company for the entire construction of the plant as such, not for any individual apparatus. If I should buy any individual apparatus for repairs and so forth, I should not add anything for engineering expenses; but in laying out and constructing a gas plant that ten per cent. is needed and added by the gas company and more than that in many instances. You must remember that that ten per cent. includes a great many other items, such as filling holder tanks with water and curbing, grading and sewerage. I enumerated them the other day, miscellaneous expenses.

Q. Now, we will turn to the 21st Street plant. The 21st Street station is a water gas plant, isn't it?

A. Yes, sir.

Q. And also includes a plant for the manufacture of oil gas to enrich coal gas at the 14th Street station, is that right?

A. Yes, sir.

Q. Will you give us the value of each of the buildings?

A. The total value of all buildings without the ten per cent. for general engineering and the five per cent. for interest charges amounts to $1,579,695.

Q. Well, I asked you to take up the buildings in detail.

A. Stove storage and meter proving shop, $57,470 without depreciation, $56,320 with depreciation.

Mr. **Page**: You have given the dimensions of these buildings, have you?

The **Witness**: Yes, sir, they are in the schedule.

Mr. **Mathewson**: They are all given.

The **Witness**: Meter repair shop and office, $59,530 without depreciation, $58,340 with depreciation.

1476 Stove repair shop, $26,830 without depreciation; $26,294 with depreciation.

Stove cleaning room, $1,285 without depreciation; $1,260 with depreciation.

Diaphragm room, included in stove repair shop.

Prepayment meter repair shop $14,557 without depreciation, $14,266 with depreciation.

Storage room $1,836; without depreciation; $1,800 with depreciation.

Washroom, $1,512 without depreciation; $1,482 with depreciation.

Q. All the buildings you have mentioned up to and including the last were built in 1890, were they?

A. Yes, sir.

Q. And you figured the depreciation at the rate of two per cent.?

A. Yes, sir.

Q. Proceed.

A. Boiler house, without depreciation $11,023 with depreciation, $10,742.

Oil storage house, without depreciation, $221; with depreciation $210.

Lead and yellow metal storage house, without depreciation $650; with depreciation $618.

Fire hose house, without depreciation $54; with depreciation $51.

Valve house, without depreciation $2,828; with depreciation, $2,743.

Q. Now the last three buildings before this one were built in 1890?

A. Yes.

Q. And this last building was built in 1883?

A. That is the way I have it here.

Q. That is the valve house?

A. Yes. Octagonal valve house, $2,592 without depreciation; $2,463 with depreciation.

Valve house, $475; without depreciation; $452, with depreciation.

Q. That building was built in 1880?

A. 1880, yes, sir.

1477 Q. And the Octagonal valve house in 1883?

A. 1883.

Tinsmith shop, without depreciation, $3,193; with depreciation $3,033.

Q. That was also built in 1880?

A. 1880.

Storeroom, triangular building, without depreciation, $320; with depreciation, $295.

Paint shop, triangular building, without depreciation, $320; with depreciation, $295.

Office building, without depreciation $20,000; with depreciation, $19,000.

Q. That building was built in 1860, wasn't it?

A. 1860 is what I have it down here.

Engine room and machine shop and gangway, without depreciation $74,991; with depreciation $71,240.

Q. That building was built in 1865?

A. 1865.

Engine room, without depreciation $8,600; with depreciation $8,428.

Q. That was also built in 1865?

A. Yes, sir.

Machine shop, without depreciation, $2,200; with depreciation $2,156.

Q. Built in 1865?

A. 1865.

Old retort house, without depreciation $74,860; with depreciation $71,117.

Foundation for benches in old retort house, $11,800. No depreciation.

New shop building, $7,420 without depreciation; $7,272 with depreciation.

Q. That building was built in 1890, wasn't it?

A. The new shop building.

Q. Yes.

A. 1890, yes, sir.

Old carbureter house, $8,176, without depreciation; $7,768 with depreciation.

Q. That was built in 1860?

A. 1860.

Generator house over machines 6 to 13, without depreciation, $63,569; with depreciation, $61,663.

1478 Q. That building was built in 1865?

A. 1865, yes, sir.

Q. Just state that in each instance where you have it.

A. Building over coke and coal storage without depreciation, $85,140; with depreciation, $83,437. Built in 1865.

Generator house, 22nd Street, without depreciation, $93,840; with depreciation, $91,963. Built in 1873.

Retort house, 22nd Street. Without depreciation $110,450; with depreciation, $104,926. Built in 1865.

Extra for bench foundation in this house, $12,700. No depreciation.

Pump house, without depreciation, $4,796; with depreciation $4,556. Built in 1865.

No. 1 shed, south side of 21st Street, without depreciation, $67,846; with depreciation $65,811.

Nos. 2, 3, 4, and 5 sheds, same values as No. 1 shed.

Q. Each?

A. Each, just the same value as No. 1 shed.

Q. Those were all built in 1874?

A. All built in 1874.

Purifier house, without depreciation, $97,626; with depreciation, $94,697. Built in 1874.

Condenser and scrubber house, without depreciation $97,626; with depreciation, $94,697.

Another purifier house of the same value. All built in 1874.

Meter house without depreciation, $38,665; with depreciation, $37,891. Built in 1884.

Shaving and scrubber house without depreciation $66,017; with depreciation, $64,037. Built in 1874.

Exhauster house, without depreciation, $42,943; with depreciation, $42,084. Built in 1884.

No. 327 to No. 331 Avenue A, not valued; included in real estate.

1479 Coal shed, without depreciation, $63,168; with depreciation, $60,010.

Stable not valued, included in real estate.

Water tower, without depreciation, $1,387; with depreciation, $1,277.

Excavation, cribbing and refilling for twelve oil tanks located on low ground, $8,118. No depreciation.

The same for ten separating tanks, $8,462; no depreciation.

One foundation for a new oil tank, $5,000.

One foundation for a steel tank, $980. No depreciation. That is all for the buildings.

Q. In arriving at the value of the buildings, I suppose you proceeded in the same method, taking the number of cubic feet contents of the buildings and multiplying that by some unit?

A. Yes, sir.

Q. What was your unit for a brick building?

A. What kind of a brick building?

Q. Any kind, it don't make any difference, does it?

A. Yes, it makes a big difference, because all these prices are based upon a specific building. You cannot compare a retort house with a generator house, or you cannot compare a generator house with an office building, but they are all brick.

Q. I thought you went by the cubic contents, no matter what the walls were?

A. No; I go by the cubic contents or the cubic feet of contents of a building, for the same class of building, not of all buildings That would not be a fair valuation. You take a retort house in one place and a retort house in another, or you take a generator house in one place and a generator house in another place, and you get a correct valuation.

Q. If you had estimated by what it would cost to put up the walls and what it would cost to put in the other material, then you would have the same unit for all kinds of buildings?

A. No, sir.

1480 Q. Brick costs as much if you put it in a retort house as if you put it in a generator house, does it not?

A. But the number of bricks that you put in a retort house of the same capacity, as far as the general plant is concerned, in comparison with the generator house would be very different; it would not by any means be the same number of bricks, the number of cubic feet would be the same.

Q. Oh, I do not mean that.

A. You have got to make a comparison for the same class of buildings otherwise you would not obtain a correct valuation.

POOR COPY

Q. What was your standard of comparison with this 21st Street plant?

A. For the retort house, the retort house of Kings County; for the condenser house, the condenser house of Kings County, for the office building, which is a two-story office building, I took the Kings County. In the instance of the buildings, it includes all the valuations of the machinery and apparatus, except where I found that additional foundations of greater depth had been built at a very much greater cost. In this instance I have added the increased cost of the foundations where they did not compare with normal conditions, as was the case of Kings County.

Q. Kings County was a coal gas plant, wasn't it?

A. Yes.

Q. Did that make any difference?

A. No; most of these buildings were originally coal gas buildings.

Q. And have been converted into water gas buildings?

A. Yes; I know from my own knowledge, and having figured these buildings so many times for various plants, that the total aggregate of the buildings forming a gas plant is so near correct that if you were to get detailed estimates of each and every building there would be no variation of any amount.

Q. The buildings in this plant as I understand you, were originally put up for a coal gas plant and have since been turned into water gas? 1481

A. In a great many instances; there were some additional water gas buildings, but the generator house was built for water gas purposes and it is exactly the same.

Q. Now, the generator house in a water gas works would be very much smaller than it would be in a coal gas plant?

A. Of the same capacity, yes.

Q. Then, if you were to give an estimate for building a water gas works to-day they would correspond with this in capacity and other particulars, but you would build smaller buildings, would you not, in some respects?

A. The buildings would be smaller for capacity; that is, a similar building would contain a larger capacity, but the price of that individual building would not change at all; my unit price would be absolutely applicable.

Q. Your unit price would be applicable, but the multiplication by the number of feet would be less and would produce a less cost?

A. Exactly.

Q. What is the capacity of this plant for water gas?

A. 24,000,000 cubic feet.

Q. Now, I do not wish to have any misunderstanding about this. You could build a 24,000,000 cubic foot daily capacity water gas plant in the way of buildings for considerably less than this 21st Street plant requires in the way of buildings now, could you?

A. Oh, no, these buildings are all completely filled with water gas machines to their full capacity.

Q. How recently have you been to those buildings?

A. Three or four times. What station are we on now.

Q. 21st Street. Is the retort house completely filled with gas making machinery to-day?

A. You asked me about water gas apparatus.

Q. I am talking about water gas. You have got down here retorts.

A. That is for the oil gas.

1482 Q. Well, call it generating house.

A. Yes, the generating house is completely filled.

Q. Have they built any new generators in there, do you know, in the last year and a half or two years?

A. I have not got the year when the last water gas apparatus was installed, but every foot of space in that entire works is taken care of by the capacity of plant. In fact, they are so close that in the generator house they are so close they are almost two together, and the walls have been broken out and columns have been substituted.

Q. Then, you think as far as the buildings are concerned—that is, if you build a coal gas plant and afterwards tear it out and instal water gas machinery you can do it cheaper than you could produce a new water gas plant with buildings adapted to that particular kind of plant?

A. Oh, yes, no doubt about that.

Q. And that is the most economical method of construction, would you say, as a gas engineer?

A. If I had the building, yes; I certainly would not tear the building down and build a new one.

Q. That is what you mean. Having a coal gas plant, it is cheaper for you to alter those buildings and instal gas machinery than it would be to tear down the buildings and build entirely new buildings?

A. Yes, sir.

Q. And if you were starting with a piece of ground, which would be the better way and produce the better results?

A. You would have to build new buildings; it would be better to build new buildings.

Q. You do not think it would be cheaper to build a coal gas plant and change it into a water gas plant?

A. No, sir.

Q. That is what you said?

A. I said if I had a coal gas plant.

1483 Q. Then, as a matter of fact, it would cost less to build a new water gas plant on this 21st Street station of the capacity of 24,000,000 cubic feet in the way of buildings than you have estimated for the value of the buildings at present in use; is that so?

A. No, sir, it would cost more. I said before that those buildings are entirely filled to capacity of water gas plant, and therefore new buildings would cost more if built for water gas.

Q. We are talking about an entirely new plant.

A. Yes, those buildings would cost more than changing these, for the same capacity.

Q. Well, I do not know if you understand my question.

A. I mean on the basis of water gas capacity, those buildings in the altered condition cost less than new buildings would have cost if they had to be built for that purpose, for the reason that the entire buildings are filled entirely to capacity.

Q. As I understand your method of getting at this, you have figured what it would cost to produce new buildings similar to these?

A. Yes.

Q. And you have not estimated what is the value of those buildings, but what it would cost you to-day to build buildings similar to this?

A. Yes.

Q. Now, if you were going to build a plant, a water gas plant, of 24,000,000 cubic feet daily capacity, would you build buildings similar to this?

A. Absolutely the same, in that location.

Q. You would?

A. Yes; I could not do otherwise, because they have utilized every square foot of ground in these buildings to the capacity of the apparatus, that is the controlling factor in the designing of the plant.

Q. And you could fill them to capacity and use them to much better advantage?

A. No, that is the point I am making. Those buildings are used entirely to capacity. Every square foot is used to capacity?
1484 You could not do better except by designing the building in different shape.

Q. Then you have an ideal water gas plant?

A. For that portion of it, yes.

Q. As far as the buildings are concerned?

A. As far as the generator house is concerned; we are talking about the generator house.

Q. I am talking about the buildings?

A. Oh, yes, the rest of the buildings contain apparatus of standard make and, therefore, could not be designed different from what they are in that location.

Q. Having settled that satisfactorily, we will turn to the apparatus. I notice you begin with your storage, tools in meter proving shops, &c. Does that correspond with the order in which the buildings are taken up?

A. No, sir, it does not.

Q. This repair shop is used for the repairing and proving of meters for the company generally?

A. Yes.

Q. And also for storage and repairs of stoves?

A. Yes.

Q. The capacity, &c., would not be limited to what would be necessary for a plant of the size of the 21st Street station alone? That is, if that was all the company had; it would not require as large a shop for a company that only put out 24,000,000 cubic feet of gas a day as they have there, but this is to take care of those things that are necessary for all the stations, is that right?

A. Yes, but it is not by any means large enough; they use it to the best advantage because they have it there.

Q. Yes, but the only thing I am trying to get at is, not criticising them for having a large repair shop, but if we wish to get an estimate of valuation upon a plant of 24,000,000 cubic feet daily capacity, you would not take this as one of the elements, because this is very much larger than is necessary, is it not?

A. No, it is not larger than necessary.

1485 Q. Not larger than is necessary for a company that only puts out 24,000,000 cubic feet of gas a day?

A. No, I know a company that puts out a good deal less gas than they do and has repair shops of three or four times that capacity.

Q. Proceed then and get at the value. How would you multiply this?

A. In getting at the value I took the building as it was.

Q. Well, this is an ideal plant; it is not anything that really exists that you are testifying to.

Mr. **Mathewson**: That is exactly what it is, something that does exist.

Mr. **Page**: No, it is an intangible figment of the moment.

Mr. **Mathewson**: Not at all. You are entirely wrong.

Q. Well, proceed with what substantial facts you can give in regard to what is in this particular house.

A. Do you want me to read this whole list?

Q. You have estimated this in its entirety; you have not the details.

A. I had the details and got them from all these various manufacturers. There is such a multitude of them that I added them together and put down the total sum.

Q. Have you got the value of the engines?

A. All engines, $17,600 without depreciation, and $17,248 with depreciation.

Q. How many engines does that make? You might read off just the engines.

A. One 15-horse-power Otto gas engine.

One 30-horse-power steam engine.

One 10-horse-power vertical steam engine, pulleys and shafts, etc.; all that goes with the engines.

Q. Whatever you have included with the value of the engine you might give.

A. One nickle-plated dynamo, 75 feet of 1 and 3/16-inch 1486 dynamo shaft; 6 cast iron pulleys, 12 to 18 inches diameter, 4 14-inch hangers, 12 16-inch hangers, 14 wooden pulleys, 13 to 18 inches diameter, 4 cast iron pulleys, 6 to 10 inches diameter, 12 feet of 1-inch shafting, 3 14-inch hangers, 3 counter shafts, 7 hangers, 16 inches by 2-3/16 inches diameter, two wooden pulleys, one elevator, 4 by 6 feet, 28 municipal arc lamps, 12 feet of 1-7 8-inch diameter shafting, 3 16-inch hangers, 18 feet of 2-3/16-inch diameter shafting, 8 cast iron pulleys, one emery grinder, 6 polishing lathes, 321 feet of 4-inch belting, 757 feet of 2-inch belting, 166 feet of 6-inch belting, 100 feet of 1-½-inch belting, one Sturtevant exhauster, 12-inch outlet, one 3-cylinder Westinghouse gas engine, 6 twelve-inch hangers, 18 feet of 1-1/8-inch diameter shafting, one Knowles double cylinder steam and air compressor, one Westinghouse 8-kilowatt lighting generator, 20 feet of one-inch shafting, 5 twelve-inch hangers, 3 cast iron pulleys, three feet of one-inch countershafts. That is all.

Q. The items you have now enumerated are included in the valuation of engines $17,600, are they?

A. Yes, sir.

Q. Now, the other various apparatus.

A. $14,300 without depreciation, $14,157 with depreciation.

By Mr. MATHEWSON:

Q. What does that make the total?

A. That makes a total of $31,900 without depreciation and $31,405 with depreciation.

Q. That is all, down to the boiler house?

A. That is all, down to the boiler house.

By Mr. PAGE:

Q. What are the gas consumer governors used for that you have in this schedule?

1487 A. They are governors probably that they put on the pipe lines in the houses. I presume they are to assist in the equal adjustment of pressure under the conditions that exist here.

Q. Now you may take up the contents of the boiler house?

A. Boiler house; do you want that in totals?

Q. I think you had better give that separately; there are only a few items.

A. Two 60 horse-power boilers, $2,710 without depreciation; $2,440 with.

Q. Those are locomotive boilers, so-called, are they?

A. Yes, sir.

Q. Each with 72 tubes, 2½ inches and 3 inches, 13 feet long; is that right?

A. Yes.

—. Proceed.

A. One 3-inch Worthington meter, $50.

Q. That is a water meter?

A. A water meter, yes, sir; no depreciation.

Two 24 by 30 steel stacks, $96; no depreciation.

Thirty cubic yards of fire brick blocks, $780, no depreciation.

Oil storage house, total contents, $50, no depreciation.

Q. What does that mean?

A. The oil tanks, cocks, and spiggots, and connections and things like that.

Q. What is the capacity for oil storage in that house, do you know?

A. No, sir, I do not; that is for a lubricating house.

Q. Oh, a lubricating house.

A. Yes, only $50 for the whole contents.

Q. I thought you were running a pretty small oil can.

A. That is a lubricating house. Lead and yellow metal storage house, entire contents, $250; no depreciation.

Q. What does that mean, the entire contents? Is that the lead and metal stored in there?

1488 A. Lead, yellow metal, smelting pots and all things like that, all small things.

Q. Proceed.

A. Fire hose house: Entire contents, $250, no depreciation.

Valve house: Do you want that in detail or the total?

Q. You might give the items in detail.

A. Photometer closet with bar photometer, $650, no depreciation.

Three gas pressure gauges, $10, no depreciation.

One Bristol recording gauge, $35, no depreciation.

One electrical pressure indicator, as called for by item 1 of addenda, $250.

Octagonal valve house, one 7 feet by 7 feet wood tank, $360, no depreciation.

One gas lamp on roof, and four gas lamps in walls, all five lamps, $40, no depreciation.

Tinsmith shop: Rigging, blocks and other contents in that house, $150, plus $400, as per item No. 2 in addenda; no depreciation.

Store room: Contents, $60; no depreciation.

Office building: Contents, except chemical apparatus in laboratory, $1,650; no depreciation.

Q. Does that include the two photometers?

A. Yes, sir, the two photometers and all office furniture, but no apparatus in the chemical laboratory.

Chemical apparatus for complete laboratory, $4,000.

Q. Well, do you mean that is chemical apparatus they have there or what would be necessary to make a complete laboratory?

A. They have everything complete there. That is a complete laboratory of all the works.

Q. That is the only laboratory they have?

A. They have a laboratory of the chief chemist of the company
where he makes all his tests, besides smaller sized laboratories
1489 in some of the stations, but this is the principal laboratory
where they make all their tests.

Q. Proceed.

A. Engine room: One Knowles combined duplex boiler feed pump, 18-inch stroke, special pattern, $440 without depreciation; $418 with depreciation. To this must be added item 4 under addenda, $400 without depreciation; $380 with depreciation.

Q. What is that item?

A. That is the Knowles combined duplex boiler feed pump.

Q. No, but this item of $400 that you add?

A. That is the cost of the pump, on account of it being made especially to the increased length of the stroke; the stroke was 18 inches long, and it was a special pattern made for the Consolidated Gas Company. My first valuation was on the normal standard of that pump.

POOR COPY

By Mr. Mathewson:

Q. How much does that make all told for the pump then? Give it to us in a single figure.

A. That makes a total of $840 without depreciation, and $798 with depreciation.

By Mr. Page:

Q. Is that what it would cost to replace that pump?

A. Yes, sir.

Q. Or is that what the pump cost to the Consolidated?

A. No, that is what the pump cost the Consolidated.

Q. You could probably replace it cheaper?

A. No, sir, I got this price from the Knowles Pump Works?

Q. As to what they charged them?

A. What they would charge for that pump to-day.

Q. Proceed.

1490 A. One Blake combined boiler feed pump, $996 without depreciation; $946 with depreciation.

One Cameron pump, $302 without depreciation; $286 with depreciation.

220 cubic feet Connersville exhausters, $5,780 without depreciation; $5,753 with depreciation.

Two horizontal Buckeye engines, $6,182 without depreciation; $5,997 with depreciation.

Q. What is the horse-power?

A. I haven't got the horse-power down here. Probably in the neighborhood of 60 horse-power—more than that—probably 75 to 80 horse-power. 24-inch stroke that is.

Q. Do you know how old those Buckeye engines are?

A. No, but I know they are in thorough condition, perfect in every respect.

Q. Proceed.

A. Three McKenzie exhausters, $5,100 without depreciation; $5,000 with depreciation.

Three 12-inch by 12-inch Rowland vertical engines, $3,642 without depreciation; $3,569 with depreciation.

Two 10-inch leather link belts, $275; no depreciation.

One 10-inch 4-ply leather belt, $85; no depreciation.

Two McKenzie oil gas exhausters, $2,660 without depreciation; $2.607 with depreciation.

Two 6 by 7 vertical engines, $396 without depreciation; $388 with depreciation.

One Armington & Sims, 10½ by 12, $1,155 without depreciation; $1.132 with depreciation.

Three Buckeye horizontal engines, $12,144 without depreciation; $11,901 with depreciation.

Q. What is the horse-power of those?

A. Probably 80.

Q. The same as the others then?

A. A little bit higher. The others were probably 75 and 1491 this probably 80, I don't know but these prices were gotten from the Buckeye people direct.

Three Sturtevant No. 16 blowers, $5,950 without depreciation; $5,831 with depreciation.

Two Cameron pumps, 14 by 7 inches by 33 inches stroke, $1,185 without depreciation; $1,126 with depreciation (refer to Item 5 in addenda).

By Mr. **Mathewson**:

Q. That was a special pump I see. Does that mean a special size?

A. That is a special size, yes, sir, on account of the stroke—33 inches. That is due to the fact that they are for so large a plant as this where the pumps and normal capacities and dimensions would not be sufficiently large and therefore they were compelled to have pumps of special stroke made to answer their purpose.

One slate gauge board, $120; no depreciation.

Steam and water pressure gauges, steam exhaust and blast piping, $4,500; no depreciation. (See Item No. 6 in addenda.)

Three 22-inch 2-ply leather belts, 60 feet long, $396; no depreciation.

Item No. 7 of addenda for blast piping, $1,094; no depreciation.

Machine shop. Do you want that in detail or added together?

By Mr. **Page**:

Q. Have you got the engine separate?

A. One Greenfield engine, 10½ by 12, $1,350 without depreciation, $1,310 with depreciation.

Q. You have something else there of $1,800, haven't you?

A. Three tons pulleys, cast iron countershafting, one half ton fittings, and working benches and three vises, $1,800; no depreciation.

1492 Q. Give the total for the machine shop if you have got it, including addenda.

A. Total for the entire machine shop, $5,935, without depreciation, $5,757 with depreciation, in which I included items 8 and 9 in the addenda.

Q. And also the engines you have testified to specifically?

A. And the engines, yes, sir.

Old retort house: Two stacks of 8 benches of six-s, 32 single benches, $70,720, without depreciation; $60,112 with depreciation.

Q. What are those used for now?

A. For the oil gas, for the production of oil gas.

Q. Do you produce oil gas in benches?

A. Those are oil gas benches.

One Worthington duplex fire pump, $178 without depreciation, $170 with depreciation.

By Mr. **Mathewson**:

Q. You have something in the addenda there, 9½?

A. I have got that in the detailed price already.

Two drip pumps, $159 without depreciation; $152 with depreciation.

Smith shop, $1,430 without depreciation; $1,376 with depreciation.

POOR COPY

New shop buildings, entire contents, $835 without depreciation; $823 with depreciation.

Old carbureter shop, in detail:

One English duplex air compressor, $2,750 without depreciation, $2,612 with depreciation.

1 Cameron pump 18 by 16 by 20 inches, $2,750 without depreciation, $2,612 with depreciation.

One Knowles pump 20 by 18 by 24 inches, $4,140 with depreciation; $4,480 without depreciation.

Q. Those are all standard apparatus?

A. With the exception of the pumps they are all special patterns. Yes, all standard.

Q. The three are standard?

A. Yes, sir.

1493 Q. Two 5,000-gallon rectangular tanks, $240 without depreciation; $233 with depreciation.

A. Witness continued:

Two 1,000 gallon rectangular tanks $80 without depreciation; $77 with depreciation.

One steam trap, $50; no depreciation.

Retort house on 22nd Street.

Three salt water condensers, 45 feet 6 inches by 9 feet 5 inches by 16 feet, containing 653 3-inch diameter cast iron tubes, $92,120; no depreciation.

Q. Is that a special condenser?

A. Yes, sir.

One similar condenser, $30,700 which is now in the course of construction. No depreciation.

Q. How did you figure that cost?

A. Why, from the weight; I figured the weight of the condenser and multiplied it by 4.9 cents a pound.

Q. You did not take the actual amount that had been expended for it?

A. No, sir, I don't know anything about what they spent for it.

Generator house over machines six to thirteen; Eight sets low water gas apparatus with 12-foot generators, 16 feet high; 11-foot carbureters, 16 feet high; 11-foot superheaters, 25 feet high; eight wash boxes, 4 feet high. Total price, $140,000; no depreciation.

Q. When were they put in, do you know?

A. No, sir, I did not inquire. They are in proper repair and perfect condition in every respect. Cast-iron floors and columns surrounding machines, as per Item 30 in addenda, $47,520; no depreciation.

Two hydraulic elevators, $4,000 without depreciation; $3,800 with depreciation.

Q. Where there is any specially designed apparatus, in reading these off, would you mention them, to save time?

A. Yes, sir.

Two Cameron pumps, $170 without depreciation; $162 with depreciation.

1494 Small gas piping, water piping, tar piping, &c., together with 600 feet industrial track, $279; no depreciation.

Add for industrial railway I omitted from schedule, as per Item 10 in addenda, $360 without depreciation; $342 with depreciation.

Building over boiler and coke storage house: Two Babcock & Wilcox boilers, 500-horse-power each, $16,500; no depreciation.

Q. Do you know the age of those boilers, when they were erected?

A. No, sir, but they are in perfect condition and kept right up-to-date in the way of repairs, else they could not use them for the water gas production.

Two new boilers of 600-horse-power each in course of erection.

Q. Do you mean foundations?

A. No, the foundations are finished and the boilers are being erected now. The boilers are right alongside of the foundations. $19,800; no depreciation.

Q. In this item, page 5, foundations going in for two more boilers, rated as 600-horse-power each?

A. That is for my memorandum. The foundations are already completed and the boilers alongside the foundations.

Q. Then your estimate is for the foundations and the boilers in their present condition?

A. No, this is for the boilers alone, $19,800; no depreciation. That just happened to be copied that way from my personal memorandum so as to call my attention to it.

Two A. & T. boilers, Altman & Taylor, 500-horse-power each, $16,500; no depreciation.

Q. Do you know the age of those boilers?

A. No, sir, but they are all in the same perfect condition and have to be in order to operate the plant.

Two steel stacks, 7 feet diameter by 110 feet high, $3,440; no depreciation.

1495 Two breeches for above stacks, $887; no depreciation.

One additional stack, as per Item 11 in addenda about one-third of which is completed at the present time, $573; no depreciation.

Two Armington & Sims engines, 10½ by 12, $2,310 without depreciation; $2,194 with depreciation.

Q. Do you know the age of those engines?

A. No, sir, I did not bother about the age of the engines because they are all perfect.

Q. Specially designed?

A. No, sir.

Two American Blower Company, fan blowers, $920 without depreciation; $902 with depreciation.

Three filter presses, Johnson & Company's make, $2,550 without depreciation; $2,422 with depreciation.

Q. Standard presses?

A. Yes, I think they are.

One centrifugal tar eliminator, $1,200 without depreciation; $1,140 with depreciation.

One horizontal engine, 7 by 9 inches, $264 without depreciation; $250 with depreciation.

POOR COPY

One round cast-iron tank, 15 feet diameter, 12 feet high, $2,442 without depreciation; $2,320 with depreciation.

By Mr. **Page**:

Q. At what rate per pound?
A. At 5.8 cents per pound.
Q. For cast iron?
A. Yes, sir, that is with flanged and faced joints and bolts.

By Mr. **Kirby**:

Q. Upon what did you appraise the foundations for the boilers in building over boiler and coke storage?

A. The boiler foundations, as well as all other foundations, 1496 are included in my valuation for the buildings and that unit figure which I spoke of before covers the foundations of these various apparatus.

Q. Proceed.
A. Two wrought iron tanks, 6 feet diameter, 4 feet 6 inches high, $153 without depreciation; $150 with depreciation.

One wrought iron rectangular tank in ground, $695 without depreciation; $626 with depreciation.

Three No. 4 Cameron pumps, $825 without depreciation; $784 with depreciation.

2,000 feet industrial railway track, switches, crossings, turntables, and so forth, $1,700 without depreciation; $1,649 with depreciation, which includes item 12 in addenda.

Q. Now, you come to the generator house?
A. Generator house on 22nd Street.

Five sets low water gas apparatus, 13 feet by 16 feet 6 inch generators, $100,000. No depreciation.

Q. Do you know the age of that Low apparatus?
A. No, the same as the others; they are in perfect condition.

By Mr. **Mathewson**:

Q. Does that include the carbureters, superheaters, wash boxes and connections?
A. Everything called for by the schedule.

By Mr. **Kirby**:

Q. On this statement, down to where it says "one experimental oil gas machine?"
A. Yes, and that item above it.

Mr. **Burr**: What does that embrace?

The **Witness**: That includes carbureters, 13 feet in diameter by 16 feet 6 inches high; superheaters, 13 feet diameter by 32 feet high and wash boxes 7 feet diameter.

1497 Mr. **Mathewson**: And twenty-four connections?

The **Witness**: Arranged for twenty-four inch connections, and connections between the various apparatus above named.

By Mr. **Kirby**:

Q. Proceed.

A. One experimental oil gas apparatus, $12,000. No depreciation.

Q. Is that a special machine?

A. Yes, sir.

Q. Is it in use to-day?

A. Yes, sir, it has been specially constructed by the gas company for a specific purpose.

Six Hazelton boilers, 250 horse-power each, $23,250 without depreciation; $22,088 with depreciation.

One Cameron pump 6 inches by 3 inches by 6 inches, $86 without depreciation; $82 with depreciation.

One Cameron pump 6 inches by 4 inches by 6 inches $90 without depreciation; $85 with depreciation.

One Worthington pump, 6 inches by 4 inches by 6 inches duplex pump, $92 without depreciation; $87 with depreciation.

Add for item No. 30 and including gas, steam, water, tar and oil piping, $47,520 without any depreciation.

Q. What do you mean by charging stage?

A. That is the floor around the apparatus upon which the coal is stored and from which the appartus are operated.

Q. Now you have the retort house?

A. Retort house on 22nd Street. Twenty single benches of 6's, $44,200 without depreciation, $37,570 with depreciation.

1498 Q. Do you mean by simple benches that they are separated one from the other?

A. No, that is only an expression to designate the length of the retort. They are set back to back, having a total length of 18 feet, but the price per bench is based upon 9-foot benches, therefore they are termed single benches.

By Mr. Page:

Q. What are they used for?

A. For the making of oil gas, the same as the others.

By Mr. Burr:

Q. Is addenda item 14 embraced in that item?

A. Yes, sir. There is one stack of 10 benches which consists of two benches back to back, making 20 in all.

By Mr. Kirby:

Q. Proceed.

A. For 40 enamelled iron wash basins and 180 expanded metal lockers, $2,420, no depreciation.

Q. Going back to those benches for a moment, you used a depreciation factor of 15 per cent., didn't you?

A. Yes, sir.

Q. Over the entire cost of the benches?

A. From the entire value of the benches.

Q. Do you know when those benches were last replaced?

A. I have not the year down here, but on account of the setting having been in there a number of years, I made the depreciation 15 per cent.

Q. Do you know how many years they had been there?

A. I don't know now, but on account of that item I make the depreciation 15 per cent.

Q. That would mean a life of how long?

A. Perhaps—these benches last very much longer than the coal gas benches, you know.

1499 Q. I understand.

A. You cannot make a comparison on that basis because they are subjected to very different conditions.

Q. That is rather a high depreciation factor for them, isn't it?

A. No, not a great deal.

Q. You don't know whether any of them had been replaced in the last ten years, do you?

A. Yes, I know they have, without asking any question about it.

Q. You know that on account of the depreciation factor?

A. I know by my own experience, that they would not last ten years.

Q. They would not have to be replaced every three years?

A. No.

Q. Or five years?

A. No.

Q. Probably ten years?

A. Perhaps six to eight years, maybe in some instances ten.

Q. Well, go on.

A. Two tar separating tanks, a total of $4,340 without depreciation, and $4,123 with depreciation, from which deduct for item 15, $965 for apparatus, without depreciation, and $897 for apparatus, with depreciation, making a total price for the two tanks, without depreciation, $3,375, and 3,226 with depreciation.

By Mr. Kirby:

Q. What did you deduct from the separator tanks?

A: On account of the difference in weights. In measuring them over again, I found they did not weigh as much as I had originally estimated.

One Worthington duplex pump, $314 without depreciation; $299 with depreciation.

Two Cameron pumps, $880 without depreciation; $836 with depreciation.

One Cameron pump, $550 without depreciation; $522 with depreciation.

One Worthington duplex pump, $250 without depreciation; 237 with depreciation.

1500 Two Cameron pumps, $170 without depreciation; $161 with depreciation.

One Cameron pump, $275 without depreciation; $261 with depreciation.

Q. Those pumps are all of standard design and build?

A. Yes.

Add, as per Item 16 in addenda, oil tank, 6 feet diameter, 10 feet deep, $189 without depreciation; $176 with.

Q. Those wrought iron tanks are used for what?

A. There is only one tank, 6 feet diameter by 10 feet.

Mr. **Mathewson**: He has not testified as to the others.
The **Witness**: That is in the addenda.

Q. Go on then.
A. You have an item there of 10 feet diameter by 30 feet long tanks in your schedule; that should be omitted. It has been substituted by Item No. 17 in the addenda.
Q. What is that item, will you read it?
A. It is ten tanks underground, 11 feet diameter by 39 feet 6 inches, ⅝-inch metal.
Q. What are those tanks used for, do you know?
A. For oil storage.

By Mr. **Page**:

Q. What is the capacity?
A. I have not got the capacity, but I can figure it out for you if you want me to.
Q. No, never mind, I thought you had it there.
A. Pump house——
Q. Haven't you left out some tanks.
A. I say those have to be omitted, those tanks, I think I said so just now. The new ones come in in the addenda.

1501 By Mr. **Mathewson**:

Q. The substituted ones come later on in the addenda?
A. Yes, sir.
Pump house:
Two Worthington duplex pumps, $356 without depreciation; $338 with.
One Cameron pump, $550 without depreciation; $522 with.
One Blake duplex pump, $250 without depreciation; $237 with.
Two Knowles duplex pumps, $374 without depreciation; $356 with.
Two Cameron pumps, $170 without depreciation; $161 with.
One Cameron pump, $385 without; $366 with.

By Mr. **Kirby**:

Q. Those pumps are all standard pattern and build?
A. Yes, all standard.
Two wrought-iron tanks, $652 without; $620 with.
Q. Having a capacity of 3,750 gallons and used for the storage of oil?
A. Yes.
One Foster pump, as per Item No. 18 on addenda, $400 without depreciation; $388 with.
Two wrought-iron tanks, $364 without depreciation; $345 with.
Sheds, Nos. 1, 2, 3 and 4; contents, coal not considered in valuation.
One hydraulic elevator, $2,100 without depreciation; $1,195 with.
Shed No. 5, firebrick and purifying material not considered in valuation.

One Cameron pump, 14 by 7 by 18, $467 without; $444 with.

One hydraulic elevator, $2,100 without; $1,995 with.

1502 Q. Do you know who the builder of those hydraulic elevators was?

A. No, sir.

Q. There is nothing special about them, is there?

A. No, just ordinary plunge elevators, which you can buy from any elevator manufacturer.

One vertical boiler, $520 without, $478 with depreciation.

One accumulator as per item 19 in addenda, $1,200 without depreciation, $1,196 with depreciation.

Q. Now, we come to the purifying house?

A. Purifier house, eight boxes, 22 by 36 by 3 feet deep with wrought iron covers, cast iron columns and beams, two sets of hydraulic lighting gears, and two 36-inch center seals. Total value without depreciation, $62,799, with depreciation, $59,659.

By Mr. PAGE:

Q. What is the capacity of this purifier house?

A. All the purifier houses in the total are equal to the capacity of the plant of course.

Q. Are they operated with the relief holders?

A. Yes.

By Mr. KIRBY:

Q. You have not figured separately the capacity of each of the separate houses?

A. No, sir.

Q. You figured this cost by taking the weight at so much, giving it a value of 5.6 cents a pound?

A. 5.6 cents a pound.

Q. And multiplying by the weight?

A. Yes. In the figures which I have given is indicated the item No. 20 in the addenda.

Q. Which one?

A. Some additional weight. Do you want the total weight?

Q. Never mind.

1503 A. Condenser and scrubber house. The first item, six tubular condensers should be omitted entirely, for which a deduction of $41,460 must be made as per item in addenda No. 21.

Q. Why do you omit that?

A. I have got them in twice.

By Mr. MATHEWSON:

Q. You have had it in twice, you mean?

A. Yes, sir. They were all considered in page 8 of my sheet; two scrubbers 14 feet in diameter, 35 feet high, $9,344, no depreciation, which includes item No. 22 in the addenda.

By Mr. KIRBY:

Q. Which was figured by weight and price per pound?

A. All the apparatus was figured by weight and a price per pound, except where they were standard and I had to get prices from the various manufacturers.

Six condensers 30 by 7 by 17; wrought iron sides, cast iron base, wrought iron tubes, containing 650 4-inch diameter by 12-foot tubes, $98,280; no depreciation.

Q. You used as your unit there 8.4 cents per pound?

A. Yes.

Q. How do you arrive at that figure?

A. The average price of the material for that condenser was 2.2 cents per pound.

Q. By average price of material you mean the average price for wrought iron and cast iron used in the construction?

A. Exclusive of the tubes; the cost of the tubes was 4.8 cents per pound; the average price for all material including tubes is 3.8 per pound, the freight and drayage is three cents per pound; shop labor two cents per pound; erection five cents per pound; makes
a total of 6.6 per pound, to which is added for operating
1504 expenses wear and tear of shop of tools 10 per cent., making
66 cents; total, 7.26, to which must be added manufacturer's profit equal to 1.1, making 8.36 per pound, or a total of 8.4 cents per pound.

Q. And to that in the grand total you add 10 per cent. for engineering and other charges?

A. For engineering by the gas company, the designing and laying out of the entire plant and other expenses in connection with the construction of the entire plant as a plant.

Q. Or, if you were to construct it for them, which you would add for your own expenses?

A. Yes.

By Mr. Mathewson:

Q. You assume that a contractor who puts in condensers figures on some profit to himself and does not simply figure on the work for the cost of labor and material?

A. No, I included 10 per cent. in those figures that I mentioned.

By Mr. Kirby:

Q. And you have reckoned that a contractor would erect this apparatus for the figures which you have there?

A. Yes, sir.

Q. And would figure 10 per cent. profit on the order?

A. Yes. As per item No. 23 in addenda deduct $16,380.

Q. What for?

A. For one condenser in course of construction which is already included in the six condensers; it was included twice.

By Mr. Mathewson:

Q. Does that mean the total, $98,280?

A. No, this has to be deducted from that, and in my total it is taken care of, in my total price.

Q. Which you have testified to?

A. Yes, that has all been taken care of.

1505 By Mr. KIRBY:

Q. So that the six condensers have a value of $98,280?

A. Yes.

Q. Where does your deduction come in?

A. Because in this I added a new condenser which was in course of construction, which would have been added twice, and it is in the six condensers already.

Q. Then there is no deduction to be made?

A. Oh, yes, from this price you have got to make a deduction of $16,380.

Q. Then we will have the cost of the six condensers?

A. The cost of the six condensers complete including the new one which I added twice. I had first the six and then an extra one.

Q. In other words there are five condensers and then a new one making six altogether?

A. Yes, I had already the new one in twice. First I had six and then a new one.

One oil gas meter, as per Item 23½ in addenda, $3,850; no depreciation.

Shed: One hydraulic elevator, $2,100 without depreciation; $1,995 with depreciation.

Six shaving scrubbers, $18,232; no depreciation.

Galleries around shaving scrubbers, with mill exhauster, with vertical engine, dust collectors and piping, and one Cameron pump, $3,342 without; $3,301 with depreciation.

Another shed: Twelve purifying boxes, 24 by 24 by 17, with twelve wrought-iron trunk-shaped covers, three 36-inch center seals; two hydraulic purifier carriages $86,968 without depreciation, $82,620 with depreciation.

Q. What item have you added there?

A. No. 24.

Q. What is that?

A. Additional weight, the first calculation being short.

Meter house: Two 13-foot station meters, $11,750 without depreciation; $11,162 with depreciation.

1506 Two 19-foot station meters, with wrought-iron cases, $21,600 for the two; no depreciation.

By Mr. MATHEWSON:

Q. That is, after deduction as per your addenda Item No. 25?

A. Yes, that is the corrected figure as per Item No. 25 in addenda.

One 19-foot cast-iron station meter, $10,800; no depreciation.

Q. Also, after deduction, as set down in addenda Item No. 26?

A. Yes.

One 16-inch Wylie proportion meter, $1,600; no depreciation.

By Mr. **Kirby**:

Q. They are standard meters, all of them?

A. These are not standard; they are a size not made of standard proportions.

Q. And therefore for which you have set down a special price?

A. No, I got that price from the meter company.

Q. They are built then by a meter company?

A. They are built by a meter company, but special dimensions, on account of this large capacity of the works.

Exhaust house:

Two McKenzie exhausters, 30-inch.

By Mr. **Burr**:

Q. You have here three McKenzie exhausters?

A. The price is charged for two, $3,980 without depreciation; $3,900 with depreciation.

One 36-inch McKenzie exhauster, $2,200 without depreciation; $2,156 with depreciation.

Three Rowland 12 by 12 vertical engines, $3,300 without depreciation; $3,234 with depreciation.

1507 By Mr. **Kirby**:

Q. Do you know how old those engines are?

A. No, sir; but they are all in perfect condition. Wherever I find a machine in perfect condition and up-to-date in operation——

Q. No matter what its age is?

A. No, I don't care what its age is.

Q. Nor do you care what the type may be?

A. No, not as far as the condition is concerned. Of course, the type has a bearing upon the valuation.

Q. How did you get the prices for those Rowland engines?

A. By applying to them for the prices.

Q. And doing that you must have mentioned the type, did you not?

A. Well, it was the type, the Rowland engine is made by the Rowland Company.

Q. But there are different types from year to year; their type of 1900 is not identical with their type of 1906?

A. Oh, yes, no change in that. There may be some changes in a few small minor details which would not affect the price of them.

Now, 321 to 327 Avenue A, omitted from valuation included in real estate. Coal shed——

By Mr. **Burr**:

Q. What becomes of all these other items opposite to 327 and 331 Avenue A. One 5 horse-power White and Middleton gas engine?

A. That is all included in the real estate. I don't know why that was, but it was telephoned to me.

Mr. **Mathewson**: It meant the building, not the apparatus. Just make a note of that.

The **Witness**: They are all very small items.

POOR COPY

By Mr. Kirby:

Q. You are of the impression that these items are included in the real estate.

1508 Mr. Mathewson: No, they are not.

Mr. Kirby: He has got it down here.

Mr. Mathewson: I know, but he is not under that impression.

The Witness: It would not amount to one thousand dollars the whole business.

Coal shed, containing one bucket elevator.

Two 20-inch Robins conveying belts and

Two cross belts, $8,000 without depreciation; $7,200 with depreciation, to which item must be added as per item 27 in addenda, $10,000 without depreciation, and $9,500 with depreciation, which item is for underground conveyor from dock to coal shed, conveyor trench and coal hoisting machinery at dock.

Q. What valuation have you put on your Greenfield vertical engine?

A. One Greenfield vertical engine 10½ by 12 inches, with pulley and shafting $1,155 without depreciation; $1,097 with depreciation.

Stable, included in real estate.

Water tower in yard, steel tank 20 feet diameter 30 feet high, value without depreciation $2,035; with depreciation $1,975.

In the retort house yard, steel tank 14 feet diameter by 9 feet 2 inches deep, $628 without depreciation; $565 with depreciation.

Steel tank 10 feet diameter by 9 feet deep $382 without depreciation, $344; with depreciation.

Steel tank 14 feet diameter by 4 feet 6 inches deep in lower portion, 13 feet diameter by 5 feet 6 inches in upper portion; $590 without depreciation; $530 with depreciation.

Separate item No. 28 in addenda, one new oil tank 57 feet diameter by 30 feet high; all material and on ground ready for erection, $3,000; no depreciation.

1509 Q. This tank has a capacity of how many gallons?

A. I have not the number of gallons. It is 57 feet in diameter.

Q. Well, proceed.

A. Steel tank 7 feet diameter by 20 feet high, $655 without depreciation, $590 with depreciation.

Steel tank 20 feet 1 inch by 38 feet 1 inch by 8 feet 8 inches deep, $2,056 without depreciation, $1,850 with depreciation.

Twelve steel tanks 8 feet diameter by 40 feet long, $1,808 without depreciation, $1,627 with depreciation.

Ten steel tanks 11 feet diameter, 39 feet 6 inches long, $16,795 without depreciation, $15,115 with depreciation. There has evidently been something omitted in the previous item of 12 tanks 8 feet in diameter by 40 feet long. I want to look whether my notes are right and whether it requires any correction. I will look it up to-night.

Steel tank 10 feet diameter by 9 feet deep, $410 without depreciation, $370 with depreciation.

Separate item No. 29 in addenda, one wooden tank 16 feet by 15 feet and one 12 feet by 15 feet high, $1,200 without depreciation, $1,176 with depreciation.

One steel tank 16 feet wide, 50 feet long, 2 feet 4 inches deep, $1,553 without depreciation, $1,475 with depreciation.

Q. Those tanks are all in use?

A. These tanks are now being erected for separating purposes. It is erected in place, complete on foundations.

Q. Which one do you mean?

A. The one 50 feet long.

Q. The other tanks are all in use?

A. All tanks are in use.

Q. For what purpose?

A. For separating purposes and storage purposes.

1510 Q. That finishes the apparatus in the 21st Street station, does it not?

A. Yes, sir.

At 5:30 P. M., adjourned to August 31st, 1906, at 1 o'clock P. M.

Last Exhibits:

Complainant's 233.
State's N.
City's 34.

1511 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Friday, *August* 31, 1906—1:00 p. m.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Page, Mr. Burr.

1512 **Frederick J. Mayer** resumed:

Cross-examination by Mr. Page (continued):

Q. Do you wish to make any correction in your testimony of yesterday?

A. One item in the 21st Street plant: 12 steel tanks, 8 feet diameter by 40 feet long, should read $18,080 without depreciation instead of $1,808, and $16,270 with depreciation instead of $1,620. That makes the total value of the entire plant for buildings, apparatus and

POOR COPY

pipe connections, including the ten per cent. for engineer's charges and five per cent. for interest $3,392,895 instead of $3,375,984.

Now, about this other item I included in the real estate I went to the 21st — Station and found that should have been in the schedule and not in the real estate.

By Mr. MATHEWSON:

Q. Those were the small items under what heading?

A. 327-331 Avenue A, those houses. I tried to get the prices for these various items this morning, but the time was too short and I could not get them and I did not want to assume any prices.

Q. You need not bother about it further unless I ask you to, because the items are comparatively small.

A. It is not over $1,250 for all of it, but I *I* did not want to assume any price because I did not in the rest of it.

By Mr. BURR:

Q. You said not more than one thousand dollars yesterday, but you say $1,250 to-day.

A. Not more than $1,250.

1513 By Mr. MATHEWSON:

Q. Would $1,250 be your estimate of the items there?

A. Yes, sir.

Q. That $1,250 you have not included in the total you have just given above?

A. No, sir; it is not included in it.

By Mr. PAGE:

Q. The generating apparatus of the 21st Street Station is practically new, isn't it?

A. Yes, sir; it is in a perfect condition.

Q. Well, I say it was put in, I think they testified here, in 1904?

A. Yes. It is in perfect, up-to-date, operating condition.

Q. What kind of a plant is it, what name does it go by?

A. It is an Improved United Gas Inprovement Company's apparatus.

Q. Is it called a Lowe water gas——

A. The original Lowe type, yes, sir, improved.

Q. Is that as efficient a water gas plant as is manufactured?

A. It is the best manufactured in this country, in my opinion.

Q. How does it compare with the Jerzmanovsky?

A. It is an entirely different process. Jerzmanovsky includes a system of benches in addition to the water gas generators to carburet the water gas in a continuous manner, whereas in this instance the gas carbureted is produced intermittently by the carburet and superheater attached to generator and therefore an entirely different type of apparatus.

Q. The Jerzmanovsky is more economical in the use of fuel, isn't it, than the Lowe type?

A. No, sir, it is not. That is if you add the three sources of fuel consumption, consisting of generators, boilers and benches as compared with the two sources of fuel consumption in the instance 1514 of the United States Gas Improvement Company's apparatus which consists of the boilers and generators.

Q. Then if Mr. Addicks testified in Boston that the Jerzmanovsky would save six pounds per thousand cubic feet of gas made over the Lowe type of apparatus, you would think he was mistaken, would you?

A. No, sir.

Q. Well, do you think it?

A. It would in that Boston instance, because that was an improved Jerzmanovsky and not the Jerzmanovsky as it has been used here.

Q. Well, of course if you are building a plant to-day and that is what you are estimating on, you would put in the latest improved machine?

A. Then you could not call it a Jerzmanovsky. You asked me about a Jerzmanovsky.

Q. I merely call it what Mr. Addicks did.

A. Well, he called it wrong. I happen to know that particular instance because I was the one that improved it.

Q. That is what I had understood.

A. Yes, sir.

Q. I had understood that was your improvement.

A. So it was, that improvement, and that improvement was made in the generator by which a reduction of fuel of 25 per cent. of the Jerzmanovsky was produced.

Q. Then a plant installed with Mayer's improvement of the Jerzmanovsky generator plant would be a more efficient and more economically administered plant than this one at 21st Street?

A. With the latest improvements in the United Gas Improvements Company's apparatus the results are about on a par, amounting in both instances to about a consumption of 32½ pounds average to the thousand feet of gas produced. Since I made the improvement in Boston the United States Improvement Company has made other improvements which has reduced their fuel consumption.

1515 Q. Is this the apparatus that is used at 21st Street? Is it the latest improved U. G. I. Lowe process?

A. Yes, sir.

Q. And in its operation compares favorably with your improvement upon Jerzmanovsky?

A. Yes, sir.

Q. This substitution that was made of the improved U. G. I. Lowe process would save how much in fuel per thousand cubic feet of gas, you say?

A. As compared with what?

Q. As compared with the old process that was there before.

A. The old process?

Q. That was there before 1904?

A. I think the fuel consumption in the old apparatus ran up to approximately forty pounds, and I think they have some results to show now in which the consumption is down as low as thirty pounds.

Q. Did you give the total value of this 21st Street plant?

A. I think I gave that already.

Q. You have given your estimate of the cost of the coal gas plant, per unit of capacity?

A. I believe I did in connection with the 18th Street valuation.

Q. And that was how much?

A. If I remember correctly I believe $340 per thousand feet.

Q. What is the value of a water gas plant such as this 21st Street per unit of capacity?

A. $123 per thousand cubic feet, not including any holders, which I excluded in all valuations of this kind.

Q. That is the coal gas plant which you valued at $340 per unit of capacity, which is for a thousand cubic feet of gas produced, isn't it?

A. Yes, sir.

Q. Excluding the holder value?

A. Yes, sir.

Q. And you say that $123 would be the value of the unit capacity of a water gas station similar to 21st Street?

A. Yes, sir.

Q. Excluding holders also?

A. Yes, sir.

1516 Q. Now, we will take up the 44th Street station. The 44th Street station of the Consolidated Gas Company is a water gas station, isn't it?

A. Yes, sir.

Q. And situated on 44th Street to 46th Street between 11th and 12th Avenues, in the City of New York?

A. Yes, sir.

Q. Will you state the capacity of that station?

A. 8,500,000 cubic feet in twenty-four hours.

Q. Now, if you will give the value of the buildings that you have already testified to as being upon the premises.

A. Governor house, without depreciation, $4,015; with depreciation, $3,815.

Q. And also state when built, if you can.

A. 1877.

Valve house, without depreciation, $3,041; with depreciation, $2,889. Built in 1877.

Carpenter shop, $3,465 without depreciation; with depreciation, $3,396.

Lumber shed, $1,771. No depreciation.

Purifier house, $60,668. No depreciation. Built in 1877.

Oxide room, valued in purifier house.

Meter house and office building, $14,556, without depreciation; $13,828 with depreciation.

Condenser and scrubber building, $14,697 without depreciation; $14,403 with depreciation. Built in 1877.

Engine exhauster and blower house, $27,362, without depreciation; $26,815 with depreciation.

Generator and boiler house, $56,788 without depreciation; $53,949 with depreciation; built in 1877.

Retort house, $61,482 without depreciation; $58,408 with depreciation; built in 1877.

Coal hoist, $228. No depreciation.

Concrete mixer and engine building, $475 without depreciation; $452 with depreciation.

Storage power tank building, $379 without depreciation, $342 with depreciation.

1517 Oil pumphouse, $3,306 without depreciation, $3,141 with depreciation; built in 1877.

Tar separator system, $1,775. No depreciation. Built in 1904.

Coal shed, $46,661 without depreciation, $34,996 with depreciation.

Scale building, $275. No depreciation.

Water tower, $1,564. No depreciation. Built in 1877.

Exhauster and boiler house, $3,416. No depreciation. Built in 1877.

Lime and oxide storage shed, $7,207. No depreciation.

Purifier meter and storage house, $44,460 without depreciation, $43,571 with depreciation.

Stable, $11,121 without depreciation, $10,899 with depreciation; built in 1877.

Tool shop, $2,563; no depreciation; built in 1877.

Storehouse, $1,541; no depreciation.

Small brick building, $788 without depreciation, $749 with depreciation.

Sheds, $366; no depreciation.

Blacksmith shop, $1,418 without depreciation, $709 with depreciation.

Pipe house, $55; no depreciation.

Pump house, $44; no depreciation.

All brick walls around works, $47,160.

All timber fences, $2,860.

Shed at oil storage tank, $188; no depreciation.

Salt water condenser foundations, $489; no depreciation.

Hot gas scrubber foundation, $353; no depreciation.

Air condenser foundation, $752; no depreciation.

Underground drainage tank in yard, $2,032; no depreciation.

Forced draft fan room, $122 without depreciation, $98 with depreciation.

1518 That makes a total for buildings without the 10 per cent. for engineering and 5 per cent. for interest charges, $407,767.

Q. I suppose you arrived at this result in the same manner as you did with the others that you have testified to, you took the Kings County buildings as a standard?

A. Yes, sir.

Q. And multiplied the number of cubic feet contents in these buildings by the unit that you obtained from dividing the cubic feet by the cost of the Kings County buildings.

A. Yes, sir, that is right. And I want to say in connection with this matter that in all instances where the buildings of the Consolidated Gas Company differed from those at the Kings County Works, for instance in the construction of the foundations, where the

POOR COPY

foundations were deeper on account of the quality of the ground or where piling had to be resorted to in order to establish a proper foundation, those additions were figured extra because they form an extra consideration outside of the basis of comparison with the Kings County buildings, which were all based upon good ground.

Q. Where are the Kings County Works situated?

A. I think it is at the foot of 55th Street in Brooklyn, on the water; it is right near the Edison Electric Station or the power house for the Edison Station.

Q. Well, you mean it is on New York Bay?

A. New York Bay, yes, sir. And the ground there was splendid building ground, consisting of sand.

Q. Then you added something for the additional cost of foundation?

A. Wherever they differed from the conditions existing in those Kings County Buildings, yes, sir.

Q. On what theory do you add ten per cent. engineering charge to the construction of the building?

1519 A. The ten per cent. is on the total plant as such, not on the buildings alone, but on the plant as a total. That, as I already explained, contains all those charges which every gas company will experience in building a new plant and includes also the alterations made in the construction or during the course of construction which are necessitated sometimes by additions and change in apparatus and improvements, and there is no contract of that kind executed where there is not always a very large extra bill to be paid by the gas company on account of these cases.

Q. That would not apply to the buildings, would it?

A. Yes, sir; when you are making a change in your layout of apparatus it effects a change in the buildings and they have to be changed correspondingly, so the item of ten per cent includes that item as well as all others previously mentioned. And all these extras, the extra additions to the buildings in my estimate for changes in raw material were estimated in detail from conditions as I found them to exist at every one of these buildings, as near as I could ascertain them. Of course, I could not dig down and find out what the foundations were, but as near as I could ascertain it I took the description from the man who apparently had the information, and based upon that my detailed estimate.

Q. But as you had in this case a plant before you that you were going to duplicate, there would not be any changes, would there, in this case? You say you are going to duplicate this particular plant.

A. Therefore, I had to include extra cost for these foundations, which were not included in my original figures.

Q. But you would not have to allow for any alterations, any changes of plan, because that had been predetermined and foreordained, as to exactly what this plant was to be before you started.

1520 A. That is so with all plants, they are always designed beforehand, and these changes take place during the construction when they see that improvements are necessary.

Q. But you could not in this case because you were going to produce the exact duplicate of this plant.

A. That is true, but the gas company had those expenses when they built the plant.

Q. But this gas company bought these buildings already built.

A. That I don't know.

Mr. **Mathewson**: Some company built them.

The **Witness**: Somebody built them.

Q. Now, we will proceed with the apparatus.

A. Governor house, entire contents, $1,655 without depreciation, $1,572 with depreciation.

Q. In this governor house I would like to have you state the kind of governor and what you valued that at.

A. Fifteen floor stands, $230.

One 24-inch Smith & Sayre governor, $1,275.

Gauges and furniture, $150. Making a total of $1,655.

Valve house, $50 without depreciation, $48 with depreciation.

Carpenter shop, $100 without depreciation, $95 with depreciation.

Q. Now the purifier house, is that next?

A. Purifier house containing eight purifiers, 24 by 24 by 3 feet deep, with wrought iron covers, two layers of trays, 24-inch dry center seals; two hydraulic lifts for the steel covers and supports for the purifiers, $43,680 without depreciation, $41,496 with depreciation.

Lumber shed not included in valuation. See item 1 in addenda.

Meter house and office buildings: two 14 foot by 14 foot station meters, with wrought iron cases, $11,750 without depreciation, $11,163 with depreciation.

Q. Does that include the foundations?

1521 A. No, sir, the foundations of the apparatus, as I have already stated, are all included in the various buildings.

Q. Will you give me the values, by referring to any notes you have, of the foundations under these two buildings?

A. No, they are included in the units of prices taken from similar buildings in the Kings County works, where these foundations were included.

Q. I know; but whatever figure you used here.

A. They are in the unit price.

Q. I know; but you had to multiply that unit by something to produce this result for these particular foundations, didn't you?

A. No; the foundations for the meters were contained in the instance of the Kings County buildings, and therefore your unit price established by using the Kings County buildings includes those costs of the foundations.

One 16-inch Wylie proportional meter and one small meter, 24 inches diameter with 2-inch connections, $1,600; no depreciation.

Office furniture, $800 without depreciation; $760 with depreciation.

One bar photometer, $650; no depreciation.

Q. Are you an expert on office furniture also, Mr. Mayer?

A. No, I am not.

Q. Go ahead.

A. Condenser and scrubber house:

POOR COPY

Two scrubbers constructed of steel with cast-iron base, 9 feet diameter by 21 feet 11 inches high, $3,575 without depreciation; $3,504 with depreciation.

Do you want me to read all the details in these different cases? I think you have them in the schedule.

Q. I think you had better read it in, as this is evidence and that schedule is not.

A. Two rectangular condensers, cast-iron base, 30 feet long, 6 feet 6 inches wide, 12 feet righ, for 24-inch connections;
1522 $31,752 without depreciation; $29,530 with depreciation.

Q. All the apparatus you have testified to so far was put in in 1877, wasn't it?

A. Yes, sir.

Q. And on these rectangular condensers with cast-iron base you took a unit price of 8.4 cents per pound?

A. Yes, sir.

Q. How much of that is wrought iron and how much cast iron?

A. Of the total I should say that the proportion of cast iron to wrought iron would be about as——

Q. Well, I will ask the question in another way which will come to the same result and be easier to answer. What is your unit of value for cast-iron, how much per pound?

A. For the cast-iron, 1.65 cents per pound; that is for the melted material; freight .2 of a cent; drayage .1 of a cent; molding .45 of a cent; machine work .85 of a cent; erection and labor .6 of a cent; total, 3.85 cents. To which must be added an item for wear and tear and operating expenses, .39 cents, making 4.24 cents, and a profit for the manufacturer of 15 per cent., making 4.88 cents. The price applied for this part of the condenser is 4.9 cents per pound.

Q. Is 4.9 cents per pound the unit you have used in estimating the value of all the cast iron?

A. No, sir, it is not.

Q. Or does that apply merely to the condenser?

A. To the condenser works, yes, sir.

Q. And what unit did you apply to the wrought iron in this condenser work?

A. The total price of cast iron and wrought iron combined brings the unit price up to 8.4 cents per pound; that includes the tubes, the tubes being a very much higher class of material than the balance of the work.

Q. The wrought iron would be 3.5, would it not?

A. The wrought iron alone, do you mean?

Q. I want to know what your two units are, which make
1523 a total of 8.4 cents a pound?

A. In this instance there is a cast iron base and the total weight would have to be proportioned between the cast iron and steel work. The addition of the two unit prices would probably be in the neighborhood of ten cents, but the average for the total condenser is 8.4, which as I said before includes the cost of the tubes, which is higher priced material than the balance of the wrought iron. I presume that the weight of this cast iron is approximately 8 per cent. of the total.

Q. You may proceed.

A. One Westinghouse No. 25 gas meter made by the Fuel Gas Manufacturing Company at Pittsburg, Pa., 24-inch diameter, 20 inches deep, $350, no depreciation. One Pelouze & Audouin revolving condenser with Smedberg improvement, $1,260 without depreciation, $1,197 with depreciation.

Q. Is that in use now, that Pelouze & Audouin condenser?

A. No, it was not in use when I was at the works.

Q. Do you know whether it is an abandoned apparatus?

A. No, sir, it is not. It is for the purpose of taking out tar by molecular attraction, and I presume it is only used in the winter time when they are making the coal gas.

Mr. Mathewson: It is the same form we are installing in Astoria now. It is not an out-of-date or unusued type.

The Witness: It is a very important apparatus in its present condition; some very large ones are being applied in the Astoria Works.

Q. Proceed.

A. Engine exhauster and blower house:

Two vertical engines made by F. G. & A. E. Rowland; 12 inches cylinder, 12 inches stroke, 4 inches steam and 4 inches ex-
1524 haust connections, 4 feet diameter and 5 inches wide fly
wheel; diameter of driving wheel, 20 inches, $2,175; no depreciation.

Two Payne engines, 14 inches diameter cylinder, 14 inches stroke, 5 inches steam, 6 inches exhaust, fly wheel 5 feet in diameter by 16 inches wide with counterbalance attachment on wheels; each engine has two driving wheels 60 inches in diameter by 12 inches wide; each engine has extra bearings for 6 inches shafting. $3,980; no depreciation.

One horizontal Buckeye engine, diameter of cylinder 14¼ by 14 inches stroke, 5 inches steam, 6 inches exhaust connection, two driving wheels 80 inches by 12 inches wide $1,990; no depreciation.

Two McKenzie exhausters, 24-inch connections, 225,000 cubic feet per hour, $3,410; no depreciation.

Three No. 10 B. F. Sturtevant monogram blowers——

Q. Are those McKenzie exhausters?

A. Yes, sir.

Q. Are some of these engine governors and compensators or machines that you have been reading before, in connection with this?

A. No, not in this instance, because they are not exhausters, they are all blower engines. And in the instance of exhauster engines you would of course have to have a governor to control the speed of the engine.

Q. Are there any engines included?

A. Not of that kind in this plant because it is a water gas plant.

Three No. 10 F. B. Sturtevant monogram blowers, 12 inches by 12 inches driving pulleys, 24-inch discharge openings, $1,800; no depreciation.

One blast gate valve.

Two butterfly valves.

POOR COPY

One steel blast flue with connections to boilers, $290; no depreciation.

One compound duplex Worthington pump with Detroit
1525 lubricators, size of diameter, 10 by 16 by 17½, cast iron
chamber, 6 inches suction, 5 inches discharge, 2 inches steam, and 3 inches exhaust, $670; no depreciation.

One Davidson pump No. 10 with cast iron air chambers, 16 by 18 by 10 inches, 6 inches suction, 5 inches discharge, 2 inches steam, 3 inches exhaust, $772; no depreciation.

Engine exhauster and boiler house:

One Knowles duplex pump 7 inches by 13 by 6 by 16 inches suction 6 inches discharge 5 inches, 2 inches steam, 3 inches exhaust, $656.

There is a depreciation on that but I have got several items added together in one lump, and the depreciation on all those is alike.

Q. You could just state that you have combined the apparatus in the engine exhauster and boiler house and figure the depreciation from the total, and that that depreciation amounts to two per cent.

A. That only refers to those two items and not previous ones. Those are all right.

One Spencer automatic damper regulator, $250.

One McClelland oil purifier tank, $53.

One Gild & Garrison No. 4 pump, 8 by 4½ by 10, $210.

One 10 by 16 by 18-inch Blake pump jet condenser, $650.

Countershafting, pulleys, bearings, hangers, brackets and so forth, $135.

The total of the above items from the Knowles pump down is $1,954 without depreciation; $1,915 with depreciation.

Generator and boiler house:

Two 8 feet 6 inches United Gas Improvement Co. sets, $29,000, no depreciation.

Four 12-feet United Gas Improvement Co. sets. Each set consists of generator, carbureter, superheaters and wash boxes, each 8
feet 6 inches, one scrubber 8 feet 3 inches diameter by 22 feet
1526 high, one condenser, 8 feet 6 inches diameter by 22 feet high,
$70,000. The twelve sets have three scrubbers 12 feet 6 inches diameter by 22 feet high, $2,438. Total of the two above items, $72,438, no depreciation.

Q. Have you included the scrubber and condenser with the 8 feet 6 inches in set in the value of $29,000?

A. Yes, they are included, except in this instance the scrubbers were located outside of the building in a separate location. That is the reason they were estimated separately. In the above sets are included the necessary hot gas wells, water jacketed, generators and carbureters, necessary blast connections and also necessary generator, carburetor and superheating interlocking gears, oil heaters, gauge bolts and pressure gauges.

Q. I notice that the two 8 feet 6 inch sets you value here at $29,000.

A. Yes.

Q. Does that include the scrubber and condenser?

A. No, that was just the generating sets.

Q. Then you have stated separately the scrubber and condenser. Did you give any value to them, or is that included in the $72,438, taken together with the other sets?

A. Yes, scrubbers for the entire generators.

Four Hazelton porcupine boilers, 200-horse-power each, 6-inch steam take-off, necessary pressure gauges, water columns, &c., in brick settings, $10,800 without depreciation; $10,044 with depreciation. To the above must be added item No. 3 in addenda, $2,400 without depreciation; $2,232 with depreciation.

Two hydraulic lifts, 5 by 5 feet platform, with overhead hydraulic cylinder, $4,000 without depreciation; $3,920 with depreciation.

Q. Where did you get that item that you add?

A. Item No. 3 in addenda, under the heading of generator and boiler house.

1527 Cast-iron charging floors surrounding water gas apparatus, $11,234; no deprecation.

Q. Now, this Automatic Gas Improvement Company's sets and generators; they are the latest improved sets, the same as was installed in the 21st Street plant, or not?

A. Yes, they are all of the same type. That is, they are all modern sets all through.

Q. Those were installed in 1904, were they not, at 21st Street?

A. They were installed in 1894 and 1898.

Q. 1894?

A. That is what I have got down here, 1894 and 1898.

Q. Wasn't that before this improvement was made?

A. No, sir, the improvement was made since that time, but not of very big consequence. The principal improvement that they made was after the patent of the Wilkinson type of generator expired, and they adopted the reversal of steam, with one and the same generator and one and the same runner. That was previous to that time.

Q. These are the latest type?

A. Yes; there may be some minor differences in the operating gear made since that time.

Q. You may proceed.

A. Retort house:

Ten benches of sixes, back to back.

One floor fired furnace, $44,200 without depreciation; $39,780 with depreciation.

Q. Those are coal gas benches, are they not?

A. Yes, they were entirely reset in 1896.

Q. But they are water gas stations, they don't manufatcure any coal gas, do they?

A. They can use these benches for the production of coal gas the same as the 21st Street station.

Q. Well, do they?

A. They did not do it at the time I examined the plant, but I presume they do it in the winter time to get up their candle power.

1528 Q. Candle power of what gas?

A. Of their water gas.

Q. Do you mean to say that you would enrich the water gas——

A. (Interrupting.) Mixture of water gas and coal gas; this gas may be taken from the 42d Street works.

Q. It is arranged now for use as an oil gas generator?

A. Yes.

Q. There is no difference in the retorts that would be used for the production of water gas and those that would be used for the production of coal gas?

A. It is absolutely the same retort. All you have to do is to put a pipe inside of it, vaporize it, and turn it out in the shape of gas instead of the coal.

Q. Is there any evidence of this having been done for that purpose?

A. I do not recall that exactly. It was not in use when I was there. I ascertained that that had been entirely reset in 1896, and that for that reason I made a depreciation of 10 per cent. What I mean by ten benches of sixes is really twenty benches. They are made back to back the same as I said yesterday.

Two Altman and Taylor B. & W. type boilers, set in one battery, 200-horse-power, with stack breeching boiler settings and steam piping, $7,637 without depreciation; $7,485 with depreciation.

Two Hazleton porcupine boilers, 200-horse-power each, with stacks, steam pipes, &c., $5,500 without depreciation; $5,390 with.

To this item should be added, as per Item No. 4 in addenda, $1,200 without depreciation; $1,176 with.

One No. 10 Monogram Sturtevant boiler, $600; no depreciation.

One 10½ by 12 Armington & Sims engine, with belting and fly-wheel, $1,210; no depreciation.

One No. 4 Garrison pump, 8 by 4½ by 10 inches, $190; no depreciation.

1529 One Berryman feed water meter 2 feet in diameter 8 feet high, $195; no depreciation.

Air and salt water condensers:

Two air condensers made by Logan Iron Works 33 feet long by 7 feet wide by 23 feet high, constructed of cast iron base with wrought iron flues, four flues to a section, 34 inches by 7 inches, each flue "U" shaped, 6 sections in all, $14,550 without depreciation, $13,920 with depreciation.

One salt water condenser of cast iron in four sections 31 feet long by 5 feet wide by 15 feet 3¼ inches high, containing 704 3-inch diameter, ⅜-inch cast iron tubes, 11 feet 7¼ inches long, $10,290; no depreciation. These condensers have been reconstructed lately.

By Mr. Burr:

Q. Give the size of connections?

A. That only refers to the connections; it don't include any connections.

Air and salt water condensers; 1 salt water condenser constructed of wrought iron 33 feet long 5 feet wide by 15 feet high, cast iron base, 24-inch connections; 3-inch cast iron tubes 12 feet 4 inches long, $8,036; no depreciation.

By Mr. MATHEWSON:

Q. Was the one before cast iron, the one salt water condenser just above this?

A. That was all cast iron.

Coal hoisting apparatus, 9 by 10 feet Hunt single, 2 cylinder hoisting engine, 4 tubes, 1,100 pounds capacity, 2 cars, 3,300 pounds capacity, 2 counter weights, 1 trolley, 15,000 pound Howe platform scale, 120 feet of trestle 20 feet wide by 25 feet high, 240 feet of track on 4 inches by 16 inches timbers, 480 feet 4 inches by 6 inches timbers carrying rails, 480 feet of rail, total $8,037 without
1530 depreciation, $7,876 with depreciation.

Water tower, 1 Blake compound duplex pump, size 9 by 16 by 12 by 10, $1,831 without depreciation; $1,740 with.

One Worthington duplex pump 10 by 10¼ by 10, with gauges, piping and tools $450 without depreciation; $423 with.

One 20 feet diameter by 20 feet tank, ⅜ inches by ¼ inches steel plate, $1,333 without depreciation; $1,200 with depreciation.

Exhauster and boiler house:

One 24-inch McKenzie exhauster, $1,705, no depreciation.

One 8 by 8-inch Greenfield reversing engine, $468. No depreciation.

Two vertical boilers, 3 feet diameter by 9 feet high, $410 without depreciation; $399 with depreciation. They were not in use when I was at the works.

Q. Have you any idea of whether they were ever used?

A. Yes, they are used, I do not know for what purpose, but they are used.

Lime and oxide shed:

One Knowles C. & F. W. duplex air compressor, 12 by 20 by 18 inches, $2,750. No depreciation.

Purifier shed:

Four cast iron purifier boxes, 34 by 24 by 3 to 4½ deep, with 24 by 4 inches cups arranged for 24 inches connections.

Four wrought iron purifier covers, trunk shape.

Two hydraulic carriages 26 by 24, 3-inch by 9 feet high, constructed of steel. The boxes in this instance are supported by brick walls. Prices for the brick supports are included in the price of building.

One 20-inch high center seal.

Total $18,532 without depreciation; $17,606 with depreciation.

1531 Meter house:

One 14 foot diameter meter, wrought iron sides and head made by the Continental Iron Works, 24 inches connection, necessary gauges, water columns, and so forth, $6,300 without depreciation; $5,895 with depreciation.

To this amount must be added as per item No. 5 in addenda, $1,075 without depreciation; $1,022 with.

Two No. 7 Sturtevant boilers, dismantled, $400 without depreciation; $360 with.

Three dismantled walking beam engines $1,150 without; $863 with.

These are ready for repairs, and I value them in their present condition as no repair parts had been delivered, therefore, in one instance the depreciation is twenty-five per cent. and in another instance ten per cent. That is the present condition of the engines.

Q. Well, do you know whether they had been abandoned?

A. No, sir.

Q. Or whether they are merely in process of repair?

A. Merely in process of repair, and as there are no repair parts there I could not include it. If the repair parts were on the ground I would consider it perfect, otherwise I could not.

Stable, 23 stalls, two box stalls, all constructed of hard pine timbers, and feed racks, $460 without depreciation, $437 with.

Tool shop, the total contents of tool shop is only $1,540 without depreciation, $1,463 with.

Store house and annex, that is only a small amount, the entire contents $420, no depreciation.

Oil tanks underground, 13 tanks 18 feet by 30 feet, $11,578, three tanks 12 feet by 35 feet, $4,575. One tank 12 feet by 7 feet, $580. Total of the above tanks, $16,733 without depreciation, $14,232 with depreciation.

1532 Tanks overground, one 8 feet by 30 feet, $890 without depreciation, $846 with depreciation.

Filter press house, one filter press, Johnson & Company, $850, no depreciation.

Tar and oil system, various tanks, total amount, $662, no depreciation.

Pump shed, total contents, $358, no depreciation.

Blacksmith shop, total amount for forges, anvils, shears and punches, $319 without depreciation, $287 with depreciation.

Q. The last figures you gave, $319 and $287, related to all the contents of the blacksmith shop?

A. Yes, sir.

Power house, one Worthington Duplex, 10 by 10¼ by 10, $468, no depreciation.

One No. 10 Cameron, $360, no depreciation.

Oil tanks, No. 6 and No. 9, oil tanks in open, 40 feet diameter, 16 feet high, constructed of steel, set in circular pit, maximum capacity 150,000 gallons each tank, $9,750 without depreciation, $9,263 with depreciation.

Concrete mixer house:

One Sturtevant engine, 4 inches diameter, cylinder 6-inch stroke, $165 without depreciation, $157 with depreciation.

One concrete mixer, $400 without depreciation, $380 with depreciation.

(At this stage of the proceeding Mr. Kirby arrived.)

Q. What is that used for, that concrete mixer?

A. For mixing concrete for building purposes.

Q. That is some temporary affair, is it?

A. Well, they move that around wherever they have to mix concrete when they are building something for themselves, from one plant to the other.

1533 By Mr. Mathewson:

Q. For repairing?

A. Well, perhaps repairing and any kind of building they have to do, instead of spending manual labor for mixing that concrete they use this machine.

Q. I think some of the pillars are enclosed in concrete at some of the stations, by order of the fire department, to save the pillars in case of fire. If that had to be done we would have to use it?

A. Yes, sir, there are many occasions where they have use for this mixer, of course.

By Mr. Page:

Q. Proceed.

A. Storage tar tanks.

Three storage tar tanks constructed of wrought iron 8 by 8 by 7 feet 6 inches——

By Mr. Burr:

Q. You have 8 feet by 6?

A. 8 by 8 by 7 feet 6, carried on wooden beams set into ground, set inside of corrugated iron building, size of tanks 10 inches by 6 feet deep, two heads, total for the three, $1,848 without depreciation, $1,756 with depreciation.

Oil pump house:

Two steel oil tanks of 12 feet diameter, 7 feet high, and one 10 feet diameter 7 feet high, $1,218.

Two Davison single pumps 9 by 9 by 12 inches, $275.

Two Cameron pumps, 12 by 7 by 13, $314.

One Worthington duplex, 7½ by 4½ by 10, $197.

One Cameron No. 8, $314.

One Worthington duplex, 6 by 5¾ by 6, $128.

One Cameron No. 9, $325.

Total of above tanks and pumps, $2,771 without depreciation; $2,633 with depreciation.

Tar Separator system:

Constructed of wrought iron, ¼-inch thick by 54 feet long,
1534 15 feet wide, 6 feet 6 inches deep, with eight compartments,
8¾ tie rods and turn buckles, $2,250; no depreciation.

Scale house:

One 10-ton scale, ball-bearing platform, 13 feet 6 inches by 8 feet wide, set in brick pit, 12-inch walls, $300; no depreciation. That does not include the pit, of course.

False draft fan, one steel plate Sturtevant ¾-housed blower, directly connected to engine; size of fan, 50 inches by 30 inches, $1,000 without depreciation; $950 with depreciation.

By Mr. **Page**:

Q. Did you figure in that brick pit at all?

A. No, that is in the buildings.

Q. Did you figure that in the buildings?

A. Yes, in the scale house. It is not in this price of $300. All the items of fire brick, fire clay, coke and coal, they are all omitted.

Q. They are not included within the inventory?

A. No, sir, they were included once but you will find an item in addenda, No. 6, that this material is not to be considered in the valuation, but deducted. That was $11,715, which I deducted; it had been included first and then taken off again.

Q. What did you make the total amount of the value of the apparatus at the 44th Street plant to be?

A. $409,175, not including the charge for general engineering and interest charges.

Q. This capacity which you have given in regard to the 21st Street station and the 42d Street station I presume is the same as you gave in reference to the coal gas stations and is the total maximum daily capacity at which it could be run continuously?

A. Yes, sir.

Q. And all parts of the apparatus are up to that
1535 capacity?

A. Yes, sir. I found in each and every instance that they could probably run a little over that capacity. In fact in some instances they have run over that capacity.

Q. This estimated capacity of yours is the capacity at which it could be run continuously?

A. Yes, sir.

Q. And not what could be forced on special occasions?

A. No, sir.

Q. To carry a heavier load?

A. No, sir.

Q. Now, we will turn to the 99th Street station. The 99th Street station is a water gas station, is it?

A. Yes, sir.

Q. And a capacity of how much?

A. 5,500,000 feet.

Q. Now, you may proceed with the buildings.

A. Engine house, boiler house, pump house, machine shop, retort and accumulator house, total value without depreciation, $96,162; with depreciation, $91,354. Built in 1881.

Generator house, without depreciation, $30,732; with depreciation, $29,807. Built in 1881.

Foundations for air condensers, $900; no depreciation.

Foundations for salt water condenser, $368; no depreciation.

Office buildings, $8,922; no depreciation.

Meter house, $10,039; no depreciation.

Purifier house, $43,539 without depreciation; $41,409 with depreciation.

Lime house, $3,787 without depreciation; $1,984 with depreciation.

Valve house and drip pump house, $108; no depreciation.

Now, there are four valve houses, all of the same size, $513 each, without depreciation; $488 with depreciation.

1536 By Mr. KIRBY:

Q. What are those values for, for the house itself?

A. For the house itself, yes, sir.

Condenser and scrubber house, $10,185; no depreciation.

Exhauster house, $8,400; no depreciation.

Tar separator system, $1,775 no depreciation.

Pump pit, $624; no depreciation.

Tar storage, $128; no depreciation.

Coal shed, $21,600 without depreciation; $19,872 with depreciation.

Q. Is that coal shed a covered one?

A. Yes, sir, it is a brick shed, 125 by 46 feet and roofed.

Filter press house, $408 without depreciation; $388 with depreciation.

All walls around the works, $15,710, no depreciation. They were rebuilt in 1895.

Fences. All fences around the works, $3,380, no depreciation.

Cover over doors of oil tank and ground, frame shed, $534, no depreciation.

Foundation under hot scrubbers in yard, $498, no depreciation.

That is all for the buildings.

Q. In estimating the value of these buildings substantially to-day, did you use any factor for obsolescence, or are they all up to date and none of them obsolete in type, or partly so?

A. Some of them are in a perfect condition. All those where there was no depreciation allowed they are perfect in every respect.

Q. I mean if any of these buildings were to be constructed to-day for the purpose indicated, would you as an engineer construct them the same way as they are now built, or would you construct them in some other way?

A. No, sir, I see no reason to make any change for that particular plant.

1537 Q. But for a plant of that capacity?

A. Yes.

Q. To have a plant of the greatest efficiency, would you construct them in this particular way?

A. For a plant of the same capacity, located on the same ground, I would construct the buildings in the same manner, in the same relative positions.

Q. In other words, if there were no buildings upon that plot of ground of any kind or character, and you were given an order to construct a gas plant of that capacity, that is, a water gas plant, you would construct these buildings in the same way and place them in the same relative positions as they are to-day?

A. Yes, sir.

Q. Making no changes of any kind?

A. None whatever. In connection with that I might say what I said formerly that every inch of ground space of all these plants is utilized to its utmost capacity and you can do no more than that in any well constructed plant.

By Mr. MATHEWSON:

Q. And there is no chance in these to increase the capacity now, so far as you can see, because all the space is already utilized?

A. Not at all. There is not an inch left for any increase unless you go up in the air, which isn't practicable for gas works purposes.

By Mr. KIRBY:

Q. Do you know on which of these two blocks of page 9, Exhibit 48, the various buildings are situated?

A. You mean do I know whether the buildings are situated on those two blocks?

Q. Which of those two blocks the various buildings are on?

A. Oh, I can't tell from memory now. I went all over every building.

1538 Q. It is not indicated on your notes so you could inform us of it?

A. No, sir. The totals of all the buildings at the 99th Street plant, without the 10 per cent. for engineer and interest charges is $248,247.

Q. You have not figured that 10 per cent. and 5 per cent. on these separately, have you?

A. Only on the total result.

Q. The grand total?

A. Yes, sir.

By Mr. BURR:

Q. What was that other figure of $96,162 and $91,354 that you gave us?

A. $96,162 without depreciation and $91,354 with depreciation. That is for the engine house, boiler house, pump house, machine house, retort and accumulator house.

Q. What is this last amount you have given us?

A. It is the total of all the buildings.

By Mr. **Kirby**:

Q. Now we will take the apparatus?

A. Generator house: 4 sets of 10 feet U. G. I. Lowe water gas apparatus with 24 inches gas take-off mains; each set consists of a 10 feet diameter by 14 feet high generator.

Mr. **Burr**: Concretor, it is here.

The **Witness**: It should be generator; with three 19¼ inches diameter coaling doors, one 10 feet diameter by 15 feet 11 high carbureter with necessary water and oil connections.

One 10 feet diameter by 22 feet high superheater with necessary superheater stacks, 36 inches diameter by 20 feet high, over all.

One 8 feet 6 inches diameter by 4 feet hot wash box.

1539 These sets have necessary hot gas valves with air jackets, also necessary generators carbureters and superheaters, interlocking gears, from meters, gauge apparatus, coal guards and so forth. The apparatus, together with the surrounding charging floor is valued at $64,167, with no depreciation.

Q. What is the apparatus alone valued at?

A. $56,000.

Q. Being $8,167 for the charging floor?

A. Yes, sir.

Q. Do you know when that apparatus was installed?

A. 1904.

Q. The old type?

A. Yes, sir.

Q. And the present type U. G. I. Lowe water gas apparatus?

A. Yes, sir.

Q. Why do you figure them altogether as one item?

A. Why that is the way the apparatus is furnished by the United Gas Improvement Company and I got this price from them; in fact they are the water gas purifiers for the various works.

Q. In other words, when you give specifications for a water gas apparatus, you generally include with it the other apparatus mentioned by you?

A. Yes, sir.

Outside of generator house. Air condenser. Construction of cast iron base——

Q. You may give those altogether.

A. —.

Length of wall, 35 feet 7½ inches width 11 inches.

Size of connections 24 inches.

$8,025 without depreciation; $7,615 with.

Q. Do you know the age of that construction outside of the generator house?

A. Well, I had it down here over twenty years, but there is a question mark around that because it was in such perfect condition.

Q. You have, therefore, only figured five per cent. depreciation?

A. Yes, sir.

Q. Notwithstanding an apparent age of twenty years?

A. No, there wasn't any difference.

1540 Mr. Mathewson: The witness says he is not sure that it was twenty years, the condition was so good, as I understand him.

The Witness: I understood it was about twenty years, but the condition was so good I could not believe it.

By Mr. Page:

Q. Where did you get the information that it was twenty years?

A. From the superintendent.

Yard:

Salt water condenser. Cast iron, 31 feet long, 4 feet wide, 15 feet 3¾ inches high.

668 tubes, 3 inches diameter by ⅜ inch, metal water tubes, 11 feet 7¼ inches long. Size of connections 16 inches. $10,045 without depreciation; $9,845 with depreciation.

By Mr. Kirby:

Q. Do you know when that was purchased?

A. 1904.

Q. And erected at that time?

A. Yes, sir.

Office building, total contents, furniture, etc., $2,000 no depreciation.

Meter house:

One 16 feet diameter station meter, $9,250, no depreciation.

One 13 feet 6 inches station meter, $6,350, no depreciation.

Q. I presume these have been installed some time?

A. The latter meter, 13 feet 6 inches, was just recently repaired and put in thorough condition.

Q. As was also the former?

A. I don't know when the former was last repaired, but it is in perfect condition.

1541 Q. And they are built in the same manner as you would have built them if you were installing them to-day for the purposes indicated?

A. Yes, sir.

Purifier house, two sets of four purifiers, 21 feet by 20 feet by 3 feet deep, three layers of trays for each box; size of connections 24 inches; two center seals, diameter 6 feet and 5 feet deep; two hydraulic lifts for purifier covers, constructed of steel, size 15 feet by 22 feet. Total price without depreciation $33,650, with depreciation $31,970.

Q. Have you any knowledge as to how long this purifier house has been in use?

A. About 25 years.

Q. Still you used a depreciation factor of but 5 per cent.?

A. Yes, sir, for the reasons stated before, that there is no depreciation except on the cover sides.

Q. And it is of the same construction as if you were building a purifier house for the purposes indicated to-day?

A. Yes, sir.

Lime house, total contents, $100, no depreciation.

Valve house and drip pump house, $30, no depreciation. That is the same in the other valve houses.

Mr. Mathewson: The next two drip houses are $30?

A. Yes, sir.

Q. And the next two $30 and $30?

A. Yes, sir.

Valve and drip pump house, $30, no depreciation.

One valve house, $30, no depreciation.

One valve house, $30, no depreciation.

The next is valve house, $10, no depreciation.

Valve house, $10, no depreciation.

Condenser and scrubber house, two 10 feet diameter by 24 feet high, scrubbers of wrought iron; two 24 feet 3 inches long by 5 feet 2 inches wide by 50 feet condensers, cast iron construction.
1542 Three vertical tubes inside of same. Wrought iron scrubbers, $4,420.

Cast iron condensers, $15,680.

Total, $20,100 without depreciation, $19,095 with depreciation.

Q. Do you know how long those scrubbers and condensers have been installed and in use?

A. About 25 years.

Q. Now the exhauster house?

A. Exhauster house one McKenzie exhauster No. 15, $1,865.

One Greenfield vertical engine, 9 inches by 9 inches, $475, total $2,340, no depreciation.

Tar separating system in yard. Tank constructed of wrought iron ¼-inch thick, 54 feet long 50 feet wide, eight compartments each 6 feet 6 inches. Eight ¾-inch tie rods with turn buckles, $2,250, no depreciation.

Q. They have been recently purchased, haven't they?

A. In 1904.

Pump pit:

Two Knowles pumps, one 6-inch by 7-inch by 12-inch, $223; one 8-inch by 10-inch by 12-inch, $265.

One Davidson pump, 8-inch by 4-inch by 12-inch, $215.

One Cameron pump, 4½-inch by 4-inch by 6-inch, $145.

Total, $848 without depreciation; $764 with depreciation.

Yard:

Three tar storage tanks, wrought iron, ¼-inch thick, 8 feet by 8 feet by 8 feet, $750 without depreciation; $675 with depreciation.

Yard below ground:

Twelve steel tanks, laid horizontally, 8 feet diameter, 40 feet long, with domes 30 inches by 36 inches, $16,267 without depreciation; $13,837 with depreciation.

1543 Q. What are those tanks used for, do you know?

A. Oil storage.

Q. There is practically no depreciation to them, is there?

A. Yes, sir, I figured 15 per cent.

Q. When were they put in?

A. 1887.

Q. What does the deterioration come from?

A. Oxidation from the outside.

Yard below ground:

Two oil storage tanks of steel laid horizontally, 8 feet diameter by 60 feet long with domes 30 inches by 36 inches, $3,848 without depreciation; $3,271 with depreciation.

Q. They were put in at the same time as the previous tanks?

A. 1887, yes, sir.

Another yard below ground:

One drip valve tank, 7 feet diameter, 25 feet long, $668 without depreciation; $602 with depreciation.

Coal shed:

Two hydraulic lifts with 10½-inch plunger, 24-inch diameter casing pipe, 24 feet long, platform 5 feet 6 inches by 7 feet, $4,200.

Two platform scales, 3 tons each, $300.

Total of the two items, $4,500; no depreciation.

Q. I note here, Continental Iron Work in parenthesis?

A. The lifts were built by them.

Yard:

Two hot scrubbers of steel, 21 feet high, 8 feet 6 inches diameter, $1,625; no depreciation.

Q. Do you know when these were placed in the works?

A. 1904.

Q. They did not cost that then, did they?

A. They did not cost this in 1904?

Q. Yes.

A. Yes, just about the same I should say.

Q. Was steel as high in 1904 as it is to-day?

A. There is a little bit difference, perhaps, in steel in favor of the present time, but the labor is higher, so as to offset the difference in saving of cost of material.

1544 Q. The cost of labor and material to-day would average about the same as it did two years ago for work of this character?

A. Very nearly, labor is a little bit higher.

Q. And material is a little bit less?

A. Material is a little bit less.

By Mr. Mathewson:

Q. You would not undertake to say exactly without investigation, would you, what the prices were in 1904?

A. No. Since 1903 the prices jumped so quick and varied so often that it is impossible to express a general opinion as to the exact value of material at that time.

Q. Without looking into it?

A. Without looking into it.

By Mr. **Kirby**:

Q. Since 1903 have they always jumped in the same direction?

A. In 1903 we were not able to make an estimate from one day to the other unless we had confirmed prices by the various mills within twenty-four hours, the prices changed so quick that we were unable to make an estimate without getting the information specially.

Q. It is not so to-day, is it?

A. It is not quite so bad at the present time, but the tendency has been in the upward direction ever since the beginning of the year, for the price of steel.

Q. In making your estimates what prices did you use?

A. In which instance?

Q. For your present appraisal?

A. For steel plates——

Q. As of what date were all these prices?

A. To day's date.

Q. Do you mean the first of August, 1906?

A. Yes, sir.

1545 Mr. **Mathewson**: He does not ask you for the exact figure, he asks you as of what date.

Q. You have stated that the prices even this year have jumped considerably in both directions, and I asked you as of what date you based your estimates?

A. Well, say August 1st.

Q. That would be a fair mean for all the prices you have stated?

A. Yes, sir.

Q. And you consider that that would not be greater than the prices of 1903 or 1904 in most instances?

A. I stated that the prices in 1903 and 1904 varied so quickly in a short space of time that we were not even able to make an estimate from one 24 hours to the next 24 hours without having the prices confirmed by the mills.

Q. The market settled down so it was pretty stable in 1904, didn't it?

A. No, I would not call it stable. It was better than in 1903, but I would not call it stable. Prices were maintained at that time for a longer period of time than in 1903, but I should not consider them as being stable. I can give you the prices I estimated exactly.

Q. These scrubbers, were they put in in 1904?

A. Yes, sir.

Q. The Company paid a certain price for them at that time.

A. Yes, sir.

Q. With your knowledge of prices of 1904, would you consider they paid more or less than your estimate at that time without considering depreciation?

A. I said before that the prices for material were probably a little bit *higher*, but that the prices for labor at the present time are a little bit higher, so one offsets the other and there would be very little difference in cost.

Q. Would that answer be true for all classes of apparatus used in the gas works?

A. Yes, sir.

Q. So if you had made your appraisal in 1904 it would be
1546 approximately the same as it is to-day?

A. Yes, sir.

Q. Go on to the yard now.

A. Another item for yards, 2 hydrogen scrubbers, 8 feet in diameter 22 feet high, $1,560 without depreciation; $1,485 with depreciation.

Q. I notice in parenthesis here "Out of commission." What does that mean?

A. They are not used at the present time. There are a great many apparatus which are not used at the present time because the production of the amount of gas at the present time does not require it.

Mr. MATHEWSON: Summer production, that has been gone all over.

Q. Take the engine house.

A. Two Sturtevant horizontal engines, cylinder diameter 10 inches, stroke 12 inches, steam 3 inches, exhaust 4 inches, $2,045.

One Armington & Sims horizontal engine, cylinder 10 inches, 12 inches stroke, 3 inches steam, 4 inches exhaust, $1,225.

Each of the above engines have two 5 feet by 12 inches diameter wheels, speed about 300 revolutions to the minute. They are connected to three B. F. Sturtevant No. 10 gas blowers, 24-inch connections with 10 by 12 inches pulleys, speed about 1286 revolutions.

Value for blowers, $350. Two McKenzie No. 15 exhausters with 20-inch connections $1,650.

Two Greenfield vertical engines, 9 inches by 11 inches, $3,726.

Two Knowles pumps, 6 by 4 inches by 7 inches—I gave $350 for blowers. That is for the driving wheels of the engine and the $1,650 is for the blowers, and $3,726 is for the exhausters, and $1,000 is for the Greenfield vertical engine. Now add $210
1547 for two Knowles pumps 6 inches by 4 inches by 7 inches, making a total in the engine house of $10,206, no depreciation.

Q. All of the contents of the engine house have been erected since 1900, haven't they?

A. Yes, sir, from 1900.

Q. And the prices you have given for engines, condensers, and the like in all instances are not merely the prices of apparatus, but the prices of apparatus set upon foundations?

A. Yes, sir, erected in place.

By Mr. MATHEWSON:

Q. That is so all through these schedules?

A. Yes, sir, erected upon foundations and placed.

By Mr. KIRBY:

Q. The foundation value, however, is not included in the apparatus but in the buildings?

A. All foundations are included in the buildings.

Q. We come now to the boiler house?

A. Boiler house:

Two batteries, B. & W. type boilers, Aultman & Taylor, Mansfield, Ohio.

Four boilers, 250 horse power each, total 1,000 horse power for two batteries, $18,750. They were erected in 1901.

Two batteries, 21 feet 9 inches deep by 19 feet 6 inches wide by 15 feet 8 inches long for each battery with a stack 5 feet diameter, 125 feet high, including the breeching, $2,386.

Mr. BURR: Are there four batteries all together?

The WITNESS: Yes, sir. All the following items refer to the boilers.

1548 One Sturtevant steel plate boiler, 5-foot wheel, direct connected to double upright enclosed engines, cylinders above shaft; size of engine 2 feet 6 inches diameter cylinders 5 inches stroke, $1,250.

One Gould & Garrison 8 inches by 4½ inches by 8 inches engine, $175.

One Patterson & Berriman feed water heater, $265.

Total for all items in boiler house, without depreciation, $22,826. *No depreciation.*

Q. These small items of tubing, 108 4-inch diameter tubes are included in your appraisal?

A. For the boilers.

Q. Have you separated them?

A. Yes, sir.

Carbureter house used as pump house, and machine shop. Do you want that in detail?

Q. No, you need not give the detail.

A. Total value of pumps, $3,900 without depreciation, $3,510 with depreciation.

By Mr. MATHEWSON:

Q. That includes the contents of that house?

A. That includes the contents in that building.

By Mr. KIRBY:

Q. How do you figure your depreciation factor over that lot of machinery, did you take it for each one?

A. From my personal examination, yes, sir.

Q. You have only figured it on the total and not on each individual appraisal?

A. Well, I examined each and every one of them and in appearance they were all just about alike.

Q. So you used the depreciation factor on the total?

A. On the total for that house.

Pump house, total contents, $860 without depreciation, $820 with depreciation.

1549 Q. You figured depreciation the same way there as in the other pump house?

A. The same way, yes, sir.

Retort house:

Eleven through benches of sixes back to back, $43,758.

Q. That is for 11 benches of sixes back to back?

A. Yes, sir. No depreciation. Now, these benches are just being rebuilt with all the new material on the ground.

Q. What have you figured on the new material that is on the ground?

A. No, I figured on the benches in complete condition. They are in a state of repair now, and will be finished before the fall.

Q. Is all the material there?

A. All the material is there.

Q. The labor is not there?

A. No.

Q. So you figured on labor which has, as yet, not been used?

A. I did in this instance.

Q. What proportion of the cost of those benches would be the labor as you figured it?

A. The total cost per bench would not be over $450 per bench.

Q. That would be how much for the benches?

A. $9,900.

Q. So you figure $9,900 in your total which is not there at this time?

A. It is not there at this time because the work has not been completed.

Q. Because the labor has not been performed?

A. Has not been performed.

Q. The material on the ground, it is worth its value as material?

A. Yes, sir, but it is being placed in position now.

Mr. MATHEWSON: The labor to produce them before has been on the ground and is a part. There is merely a substitution. The labor is there if they have ever been built.

Mr. KIRBY: Labor not as yet performed has not been there,
1550 and that he has figured as $9,900.

Mr. MATHEWSON: Labor has been performed in producing them originally, and this is merely replacement.

The WITNESS: It is replacement.

By Mr. MATHEWSON:

Q. Ordinary repairs in fact?

A. Yes, sir.

Mr. MATHEWSON: So the labor is there.

By Mr. KIRBY:

Q. In the retort house you found 11 benches back to back in course of construction, didn't you?

A. Yes, sir.

Q. On those certain work had been performed?

A. Yes, sir.

Q. And certain material was there?

A. Yes, sir.

Q. Now, the material and the labor complete would amount to the estimate you have given ,wouldn't it?

A. Yes, sir.

Q. The labor to be performed you have figured at $9,900, haven't you?

A. Yes, sir.

By Mr. **Mathewson**:

Q. It is in course of repair, isn't it?

A. Yes, sir. I want to state this is a repair, the same as any other instance where we put new settings in the brick arches. The arches are there and the iron-work is there, and they are merely putting in new material to get ready for the next season.

By Mr. **Kirby**:

Q. But be it repairs or not, it is not there?

A. The labor is not there, but the material is there.

1551 By Mr. **Mathewson**:

Q. Is not the labor there which produced it originally?

A. For the original construction, yes, sir.

By Mr. **Kirby**:

Q. Where is the original construction?

A. The same as this was before it was taken out.

Q. Where is it now?

A. It was torn down by the gas company.

Q. Where is the original construction, is it standing there?

A. No, but the money for building it has been expended.

Q. But the result is not there?

A. No.

Q. That for which the money was spent has been taken away?

A. Yes, to a certain extent, not all.

Q. How much is left?

A. The arches and iron work.

Q. You have figured those, haven't you?

A. Yes, sir.

Q. In your appraisal?

A. Yes, sir.

Q. So that is left you have given a value to and included in your appraisal, haven't you?

A. Yes, sir.

Q. And all that is there in the way of material you have included?

A. Yes, sir.

Q. And you have also included labor which is not there as yet, haven't you?

A. Yes, sir.

Q. And that labor is $9,900, isn't it?

A. Yes, on the repairs to the benches.

Mr. **Mathewson**: As a matter of fact, we lose so much capital every time we make repairs.

Mr. **Kirby**: That is a question for argument.

Mr. **Mathewson**: It is a fact.

Mr. **Kirby**: You cannot value a thing that you have not got.

Mr. **Mathewson**: He can have the labor that we put into
1552 it. You do not lose it when you come to repair it.

Mr. **Kirby**: The legislature may give a certain amount for my services, but I haven't got it yet.

Q. We will go on with the next item.

A. The eleven empty arches should be erased from page 4 of description of apparatus, 99th Street station.

The **Master**: These are not even marked for identification, so it is useless to refer to them.

Mr. **Kirby**: Under the circumstances I think it is all important that we read every item, if they are not exhibits in the case. In many instances we have taken lump sums for the whole contents of buildings, where the items have been less than one thousand dollars and there is no description whatever on the record what that apparatus is, unless these are in the case.

The **Master**: There has been no objection to having them marked for identification, and Mr. Mathewson wanted to put them in evidence. I suggested that they should be put in and the Senator thought, and Mr. Burr thought, and I supposed that you thought also, that it was better to have all these facts appear on the record in the examination of Mr. Mayer, and these typewritten memoranda were used simply for the purpose of convenience in questioning him. I suppose there is not the slightest objection to marking all of them for identification or even in evidence.

Mr. **Mathewson**: Not the slightest.

The **Master**: So do not raise a windmill and fight it. We have enough real trouble without it.

Mr. **Kirby**: I do not see any real reason why they should
1553 not go in as the basis of Mr. Mayer's appraisal, but we certainly want an opportunity to cross-examine as to his values. We have not the apparatus here to measure, but we have the values to cross-examine him on.

Q. Go on with the accumulator house.

A. Accumulator house—do you want that in detail?

Q. Yes, give it in detail.

A. One accumulator, 20 feet high, 6 and 8 inches long, 3 feet wide, diameter of plunger 12 inches, length of plunger 12 feet, size of base, 6 feet 7½ inches by 3 feet, connections 4 inches; the plunger is counterweighted by cast-iron counterweights about 18-inch diameter.

The accumulator foundations consist of 12-inch I-beams, 16 feet long, set into building walls, $960; no depreciation.

One steel water tank, 10 feet diameter, 12 feet high, ¼-inch metal set upon four [illegible]0-inch I-beams, 16 feet long, $351 without depreciation; $347 with depreciation.

One Davidson single pump, 14 by 8 by 14 inches, 6-inch suction 4 inches discharge, $390 without depreciation; $370 with depreciation.

Yard, wooden top tank, 24 feet diameter, full 2,000 gallons, $500 without depreciation; $375 with.

Filter press house, two Johnson filter presses, 15 by 2 feet 6 inches by 4 feet, $1,700, no depreciation.

One 10-ton Howe scale, $300, no depreciation.

Q. Those filter presses are recent construction?

A. Yes, sir.

Q. The same as in the other plants?

A. Yes. Miscellaneous tanks located in boiler house. Do you want that in detail?

Q. Yes, you better give them now.

A. One discharge tank 1¼ inches steel 4 feet by 3 feet by 4 feet.
One boiler feed tank, ⅛-inch steel 6 feet 6 inches by 4 feet
1554 6 inches by 9 feet 6 inches. Do you want those prices in detail?

Q. No, the total.

A. One overflow tank, ¼ inches steel, 5 by 7 feet 6 inches by 3 feet, one gas oil tank, ¼ inches steel 10 feet 4 inches diameter by 10 feet. One fuel oil tank, 3/16 inches steel, 1,500 gallons capacity. One gas oil tank, 10 feet diameter 10 feet high. Total for all tanks, $1,282 without depreciation; $1,155 with depreciation.

Coal, oil, oxide and shavings, not considered in appraisement. Do you want me to include this item (indicating), because that is referred to in your list and also in the addenda, or shall I leave it out?

By Mr. Mathewson:

Q. There is no use of giving that; say fire brick not included.

A. List of fire brick not included in valuation.

By Mr. Kirby:

Q. How about retort house?

A. That is addenda. We had that before. Total for all apparatus without 10 per cent. engineering charges and 5 per cent. for interest charges, $268,177.

Q. Are there any buildings or apparatus in this plant or any other plant, besides those 11 benches in the retort house that we have been speaking of, that are in course of construction and on which you have figured labor that has not yet been performed?

A. No, sir.

Mr. Mathewson: These are not in course of construction. They are constructed and have been there a long time. They are merely in course of repair.

Mr. Kirby: Call it what you may, they are not as yet finished.

Mr. Mathewson: That is another proposition.

1555 Q. You examined all this apparatus yourself?

A. I did.

Q. And went over all these buildings yourself?

A. I did, repeatedly.

Q. And you made no plan as to where the relative locations were between blocks 88 and 89th Street, East River and Second Avenue, did you?

A. No, sir, I did not; there was no necessity for it. I made my schedules as to the apparatus right on the site of the same and measured the distances between them for my connections, put that down and from that made my measurements.

Q. Did you lay a plan down for the location of this apparatus?

A. No, there was not time to do that and there was no necessity for it.

By Mr. Page:

Q. The 18th Street plant is not now in use as an operating plant?

A. No, sir.

Q. And the building and apparatus that you examined and testified to on your examination in chief are remnants of a manufacturing plant, are they not?

A. Yes, with the exception of the holders, valve house—some of the holders and valve houses which are now in use for the dist[illegible]tion of gas.

Q. What portion of this plant would it be necessary to retain as a distributing station in connection with the holders that are there?

A. I do not understand that question exactly.

Q. I understand that this is now used as a distributing station and there are some holders and you said it had a valve house?

A. Yes, valve house, several holders, boiler house and exhauster house.

Q. I say, how much of this apparatus that is left there is necessary to be used for a distributing station?

A. All of it.

Q. Do you want a 90-horse power boiler to run that gas holder and your valves?

A. Yes, sir.

1556 Q. Do you need a McKenzie exhauster?

A. Yes, that is a pump and comes from the other stations to fill the holders at this station.

Q. Then, all are the matters of apparatus which you have given, and about the value of which you have testified, apparatus that is actually in use for the purpose of distributing gas at that station?

A. Yes.

Q. Or is any of it what is left over from the manufacturing plant and not necessary for use in distribution?

A. All that is left now is required for the distribution. In my connections I have included only one single pipe from the exhausters to the holders; the rest are in some instances three and four pipes from the former plant, which have been included in my valuation.

Q. Now, you may give the valuation of the buildings at this place for the purpose of distribution.

A. Five frame sheds; total for the five sheds, $145 without depreciation; $73 with.

Engine, valve, and exhauster house, $5,678 without depreciation; $5,225 with depreciation.

Valve house, $1,523 without depreciation; $1,400 with depreciation.

Boiler house, $1,841 without; $1,693 with.

Stable, included in real estate schedule.

Shed, included in real estate schedule.

Dwelling, included in real estate schedule.

Wagon shed and paint shop, $1,020 without depreciation; $970 with.

Wagon shed, $1,322 without; $1,256 with.

Brick and brownstone building used as enclosure for holders, $169,328 without depreciation; $155,784 with depreciation.

Q. What do you mean by that, that the holders are put inside of a brownstone front or not?

A. Well, there it is, a large building in which are located two holders as a protection for the holders against snow and in- 1557 clement weather, and the man that has to go on top of the holder to clean it. It is an old construction that would not be carried out in these days.

Q. It is absolutely useless, is it?

A. No, it is not absolutely useless. The building is there and contains the holders, and the holders are distributing holders.

Q. Well, I say the building does not serve any purpose. You say a holder will last forever if left exposed to the elements. Then what necessity is there for enclosing it in a brownstone front?

A. I would not build it to-day, but it was built in the days when they considered it necessary to have a building around it to protect it.

Mr. MATHEWSON: And it is not necessarily a brownstone front, Senator.

Mr. PAGE: He says it is a brownstone front.

The WITNESS: No, brownstone—brown trimmings around the windows and things like that. In Chicago the holders were enclosed up to the year about 1880, in very large circular buildings, and it has only since 1880 been abandoned; the use of those holders there, and the weather was very severe.

By Mr. KIRBY:

Q. They do not enclose holders now where the climate is severe, do they?

A. Yes.

Q. All over the world except in Canada and in England?

A. None enclosed in England and none in Canada.

Q. None in Canada that you know of?

A. Yes.

Q. Old construction?

A. Yes.

Q. No new construction?

A. No, sir.

Mr. MATHEWSON: It depends upon the section; there are 1558 some sections still using them and erecting them.

By Mr. PAGE:

Q. If you were erecting this plant, which I understand the company wishes to have valued and for which purpose you have been retained to testify, as to what you could produce this plant for today, you would eliminate this brick and brownstone building from any such estimate, would you not?

A. If I was asked to make a valuation of that now? No, I should not eliminate it because it is there and represents the value that I have given it in my schedule. I have valued everything that I found on the premises that was in actual operation or use.

Q. Have you got anything more?

A. Coal storage yards between 18th Street and 19th Street, value of all timber, fence and retaining walls without depreciation, $1,502; with depreciation, $1,352.

Coal storage yard between 17th and 18th Streets, timbers, fences and retaining walls, $2,160 without depreciation, $1,944 with.

Brick walls in yard between 17th and 18th Streets, $1,960, no depreciation.

Timber, coal hoisting trestle, $4,160 without, $3,744 with depreciation.

Holder yard between 18th and 19th, brick retaining wall, $7,500. No depreciation. That makes a total for all buildings, $182,901.

Q. Now, you might give us the plant that is in those buildings?

A. Frame buildings in holder yard: There are two vertical boilers and one locomotive boiler which are of no value and can only be considered as scrap, and I have not valued them.

Engine house and valve-house:

One 20-inch McKenzie exhauster, $1,584, without, $1,505 with.

1559 One Greenfield engine, 8 by 10 inches, $440, without depreciation. $418 with.

Countershafting pulleys and belting, no depreciation, $80.

Three King's pressure gauges, $105, no depreciation.

One arch gauge, telephone booth, lockers, etc., $130, no depreciation.

One building containing pressure gauges; total amount $167, no depreciation.

Boiler house:

One horizontal tubular boiler, 90-horse-power 8 feet diameter, 15 feet 6 inches long; 2 feet diameter by 30 feet stack, total value without depreciation, $1,973; with depreciation, $1,815.

One small Worthington duplex pump, 4½ by 2¾ by 4, $60 without depreciation, $57 with.

Pressure gauges, water columns, etc., $25, no depreciation.

Lockers, $50, no depreciation.

Stable:

Twelve stalls, $250, no depreciation.

One box stall and lockers, $60, no depreciation.

Coal storage yard, trestle work consisting of A frame posts 40 feet high and A frame posts 50 feet high, each frame rests on two piles and 3-inch plank flooring over entire area; construction of A frame post consists of seven 50 feet posts made up of 12 inches by 12 inches diameter 50 feet long, and seven posts 40 feet high for coal carrier. The total value is $10,396 without depreciation, and $9,357 with depreciation.

Q. What is the storage capacity of that?

A. I could not tell you, that depends on the height to which they fill it. They have got six coal trestles with buckets running across the entire yard, and those buckets are nearly at an elevation of about 35 to 40 feet I should say.

1560 Q. How large is the yard? Or, in other words, that coal storage is large enough for the storage of the coal that is used in the gas works when it is in operation, is it not?

A. Yes, and I should say it would not be less than—probably operated to full capacity—I should say two and one half months' capacity. I can give you the lineal dimensions of the whole building that forms the coal storage, but I did not figure the planking; I took it all out because it was all rotten, so I did not figure that, but I can give you all the lengths.

Q. Is it used now for coal storage?

A. It can be used at any time.

Q. Oh, I know that, of course, you can pile coal on a vacant lot for that matter.

A. All the machinery is there.

Q. But the question is, is it used?

A. It was not used for such purpose when I examined the plant.

Mr. Mathewson: He did not give the total of that apparatus.

Q. That was what I was going to ask him. What value do you put on the apparatus?

A. $14,019 total value of apparatus at 18th Street station.

Q. The total value of this plant excluding the holders at the 18th Street station is $192,920, is it?

A. No, sir; it is $218,907, excluding the holders and excluding the ten per cent. for engineer charges and five per cent. interest charges. We have not yet accounted for or placed any value on the pipe connections.

Q. Well, you may value those pipe connections.

Mr. Mathewson: He stated that already, what they were, in detail, and their value.

The Witness: Yes, I gave it once before.

1561 Q. For some purpose, there was a question on direct examination, to mentally reconstruct these works and value them as reconstructed, and in doing so I believe you used the unit of $340 per thousand cubic feet of capacity?

A. That is right, sir.

Q. And you stated that the reason you did that was because these works were owned originally by the same company that owned the 14th Street works and you thought that the same unit should be applied; is that right?

A. I did not say I thought they were owned by the same company.

Q. Didn't you?

A. I said that they were conducted along the same lines, with some considerable improvements at the 18th Street over the 14th Street on account of iron coal hoppers located alongside of the iron retort house, iron structures.

Q. Did you state that on your direct examination what you are now stating?

A. I think I did, to my best recollection.

—. On page 1,381 of the testimony you were asked this question: "Q. Do you know that the 14th Street plant and the 18th Street plant were the property of the same company when the consolidation took place in 1884, do you? A. Yes.

Q. Did you observe, as far as you were able to observe, any difference in the character of the plant so far as the cost of plants were concerned? You say you took the same figures? A. It was practically the same plant as 14th Street."

A. Yes, now if you will read a little bit further I think you will find I made that other statement.

Mr. MATHEWSON: Either to Mr. Kirby or to me he did; there is no doubt about that.

Mr. PAGE: Yes, here it is on page 1,382.

1562 Q. The unit that you found by dividing the capacity on the 14th Street plant by the value that you gave excluding the holders, would be $327 and a fraction?

A. Yes, about $327.

Q. $327.18, I figured it.

A. Yes.

Q. And for the increased coal facilities you added $13 to each unit of capacity?

A. No, sir, not for that reason.

Q. Well, for what reason did you do that?

A. Because the 42nd Street plant, which was a 4½ million capacity figured up to $330, indicating that the smaller the plant is the higher the unit must be in the same proportion; 14th Street, being a five-million foot plant, and 42nd Street being a 4½ million feet, and 18th Street in its original condition only being 3½ million, the same ratio of increase in that unit would be $340.

Q. The figure that you have taken has been arrived at by a comparison of those particular plants, the 42nd and the 14th Street plants, dividing the value by capacity?

A. Yes, sir.

Q. It has not been based upon your experience as an engineer, as to what a coal gas plant should be valued at per unit of capacity?

A. Yes, it has. The valuation of the 14th Street and 42nd Street at $327 and at $330 is just about the amount that works of that sive cost to-day, and then I figured them and found that these prices were obtained, and I felt sure that that was about right.

Q. Then, as I understand it, a modern up to date coal plant with all the improvements that have been devised since these plants were built would be worth the same rate per unit of capacity?

A. Yes, as far as they refer to plants constructed in this country.

Q. Certainly, plants constructed in this country.

A. That makes a big difference.

1563 Q. Oh, yes, I suppose it does. You have built a number of plants in Canada, have you?

A. Yes, sir.

Q. And you have built them in Havana?

A. Yes.

Q. And what unit did you use in Canada?

Mr. Mathewson: I object to that as immaterial. The conditions are not shown to be at all similar. If we get into matters of comparison and one thing and another we will never reach an end if we start in this way.

The Master: I will allow it.

Exception taken by Mr. Mathewson.

A. In the instance of Canada it was a water gas plant, and could not be compared with this at all.

Q. You have never built any coal gas plants in Canada?

A. No, and in the instance of Havana it could not be compared, because climatic conditions are such that they require entirely different conditions from what they do in this country.

Q. Where else have you built coal gas plants in the eastern part of the United States, except in the city?

A. The Kings County plant was a coal gas plant in its first construction.

Q. How long ago was that?

A. 1899, that was the last coal gas plant.

Q. What was the capacity of that plant?

A. At that time it was a million and a half, with buildings arranged for duplication, arranged for three million of coal gas and one and one-half millions of water gas, if I remember correctly.

Q. Its capacity as you constructed it was one and one-half millions?

A. With the buildings arranged for three millions.

Q. What unit of capacity did you figure that on?

A. I have not figured that at all. That would not apply in this case because the apparatus was not the full capacity of the buildings. I just know from my engineering knowledge that the 1564 coal gas plant averaged about that price per thousand feet of producing capacity.

Q. You have stated that the unit of capacity of a 3,500,000 cubic feet plant is $340, the unit of a 4,500,000 plant is $330, and the unit of a 5,000,000 plant is $327?

A. Yes, sir.

Q. Now, does it progress in equal ratio? What would be the unit of a 9,500,000 coal gas plant?

A. No. There would be a change in ratio when you would get above or below a certain capacity.

Q. What is that capacity where the unit becomes at its lowest and then begins to increase?

A. This ratio I have applied would probably be correct for works from 3,000,000 to 5,000,000 feet per day.

Q. Which ratio? You applied more than one here.

A. Well, the ratio between those three.

Q. Now, what is it between 5,000,000 and 6,000,000?

A. Between 5,000,000 and 6,000,000 would probably be in the neighborhood of $315. Where you advance a little below the capacity of 3,000,000 you would probably run up to the neighborhood of $375 to $400. When you get to the small sized plants it increases very fast.

Q. We are dealing in large plants, though here. Now, haven't you a regular table which you use in estimating the value of plants per unit capacity?

A. No, sir, and such a table cannot be made. There are sufficient differences in the various plants in the details of construction so that the table would be of no value except a total average for the entire value of the plant.

Q. Where does the ratio become stationary before it rises again? You say that it rises after a while as the plant gets larger. Take the seven million daily capacity, what would that be? Figure on that?

A. I don't say that the ratio becomes stationary. It is changing continuously but the rate of change alters. The rate of change is
not the same.

1565 Q. Well, give us what you estimate a 7,000,000 cubic foot
daily capacity coal gas plant at?

A. You mean under conditions as built here now without any of the latest apparatus for purification?

Q. No, I want an up-to-date plant. You would not build anything but an up-to-date plant to-day, would you?

A. Well, I made the remark before that there is a difference between this and other countries as to up-to-date plants.

Q. Take this country.

A. It is a common thing in this country to include those things in an up-to-date plant. Purification and bi-product plants depend upon the development of chemical industries in this country and when we have them we have to build our plants as in Europe and they run up to $400 easily.

Q. Which is $400, the plant in Europe where they have cyanide bi-product recovery?

A. Yes, sir.

Q. And certain other bi-product recoveries which we do not recover in this country?

A. At present.

Q. Let us eliminate the things obtained in Europe which do not obtain here, and give us an up-to-date American plant as you would build it in this country.

A. Without the differences I mentioned just now, for 7,000,000 capacity?

Q. Yes, do not put in anything you would not put in in this country.

A. I cannot give you that exactly. Those are approximate values. There is no fixed basis upon which you can value that except by comparing with these other plants. I cannot estimate the plants in a moment off hand. Here are positive data which I figured in detail and that is as good a comparison as you can get; there are absolute facts.

Q. Well, give us ten million?

A. I cannot do it offhand.

Q. Why not?

A. Because I cannot. I will have to refer to some figures.

1566 Q. Didn't you figure the capacity of the horizontal retort unit, as you might call it, at Astoria, and isn't that a ten million cubic foot daily capacity?

A. That would only be a portion of the plant. The retort unit would be a portion of the plant.

Q. I say did you figure on nothing but the retorts over there? Did you figure on the entire plant?

A. No, I did not.

Mr. Mathewson: Oh, no, a very small part of it.

The Witness: These comparisons cannot be easily made.

Q. You have nothing by which you could make such a comparison?

A. Oh, yes, lots of it.

Q. Well, value it?

A. You have got to give me time to investigate my figures and refer to my records. I cannot do it now. I believe I have more figures of the cost of coal gas plants than any other engineer in this country.

Q. But you never before figured on this per unit of capacity with the value of plant?

A. Oh, very frequently, after comparing in a general manner, and the plants vary from $350 to $400; others about $325. It depends on the details of construction; one costs a little more than another; but here is an absolute comparison between plants similar in construction, and you could not get a better basis of comparison than those I have applied here.

Q. Have you sometimes figured as low as $300 for a limited capacity?

A. Well, I do not figure it at all except for general comparison. I do not believe any coal gas plant can be built for $300. I don't think any of them would be less than $330 or $340 or $350 in capacities of from three million to five million.

1567 Q. It would cost less per unit of capacity to build one coal gas plant that would produce 9,500,000 cubic feet, wouldn't it, than it would to add together these two, 14th Street and 42d Street?

A. Oh, yes. You mean in one plant?

Q. Yes.

A. Yes, sir.

Q. How much less per unit of capacity?

A. I cannot give you that information unless you give me time to look over my figures. It is impossible to give that at a moment's notice.

Q. Well, can you give it approximately?

A. It would depend on the details of construction. They may vary from $350 to $400. It depends on what the plant contains.

Q. You have been building gas plants in your mind right along. Supposing you build one in your mind that would produce 9,500,000 daily capacity?

A. No, I would not say that offhand. I am not accustomed to give figures that way. From an engineer's standpoint it is necessary to refer to records and data to be correct, and I do that in all my calculations, and I won't give any offhand figures.

Q. You gave as a unit of value for a water gas plant $123 per unit of capacity, excluding holders?

A. Yes, sir.

Q. Is that subject to the same fluctuations and limitations as the figures on the coal gas?

A. Not as much, for the reason that there is not as much difference in the apparatus and value of the apparatus; secondly, there is not the same chance for the same variation as there would be in a coal gas plant.

Q. Then you think that would be a fair unit to assume on the value of the water gas plant, no matter what the capacity might be?

A. Yes, I think that is right.

By Mr. Mathewson:

Q. That is excluding the holders?

A. Yes, sir.

1568 By Mr. Page:

Q. All these figures are exclusive of holders?

A. Yes, sir.

Q. There seems to be something of a fluctuation in the value you have given of your three water gas plants here: The 44th Street plant would seem to be $114 per unit of capacity, the 99th Street plant, $119.50, and the 21st Street plant $125.

Mr. Mathewson: $123, isn't it?

The Witness: Wouldn't that be $124 instead of $114 in 44th Street?

Q. Well, will you give what is right, if that is not right?

A. Well, I make it $124, not $114.

By Mr. Mathewson:

Q. For what?

A. For the 44th Street plant.

By Mr. Page:

Q. And $120 for the 99th Street?

A. $120, yes, sir.

By Mr. **Mathewson**:

Q. How much for the 21st Street plant?
A. $123.

By Mr. **Page**:

Q. What did you give as the total value of the plant without holders? The entire plant you have got there, haven't you?
A. Which plant?
Q. All of them. Haven't you got it in one sum?
A. All the plants, yes, sir. The total value of all the plants is $11,991,404, without holders.

By Mr. **Mathewson**:

Q. Does that include everything but the holders?
1569 A. That includes everything except the holders, and the original 18th Street plant.

By Mr. **Page**:

Q. It would be possible, would it not, to construct as one works, a coal gas plant, that would produce 9,500,000 cubic feet to-day?
A. Oh, yes, sir.
Q. And a water gas plant that would produce 41,500,000 cubic feet per day, wouldn't it?
A. Yes, sir.
Q. And if you construct a coal gas plant of 9,500,000 cubic feet per day it would be proper and it would be ample allowance, wouldn't it, to multiply that by $3.15 for instance of capacity?
A. That is a unit of $3.15 per thousand cubic feet.
Q. Yes, that ought to give you——
A. $3.15?
Q. Yes, $3.15.
A. No, sir.
Q. What figure would you use?
A. Well, I said before I could not tell. It depends largely upon local conditions. You cannot average that.
Q. Well, it would not be more than $3.27, would it? That is what would produce a five million capacity—it certainly would not be more than that?
A. You mean $3.27 or $327?
Q. Oh, $327. I mean, for a 9,500,000.
A. On the valuation of plants of large size in that matter I would prefer not to make any positive statement until I can examine my records of cost. Cost of larger sized apparatus in proportion to the capacity is of smaller cost than smaller sized apparatus, and I would not like to state offhand what that would amount to and the total cost unless I examined my records.

By Mr. **Mathewson**:

Q. Did you not have to have some special construction for
1570 such a plant which would be more costly than the standard construction?

A. I said before it would depend upon the local conditions. It is very bad to compare one plant with another which is not of the same detail of construction. Here I have made values of the same detail of construction and you could not get a better comparison then as I have made here.

By Mr. Page:

Q. If you were called upon to construct a plant for the use of the Consolidated Gas Company, to-day, would you scatter the works around as they are here?

A. No, sir, I certainly would not.

Q. The works divided into five manufacturing stations require a much larger investment in plant, do they not, than it would to bring them together into one station?

A. Decidedly.

Q. And also the cost of operation is very much more in the scattered stations than it would be in the one station?

A. Yes, sir.

Mr. Mathewson: This witness has not operated plants. I don't think he should be asked that.

Mr. Page: He may know more about it than some people who have operated plants.

Mr. Mathewson: Possibly, but he may not know as much about it as some who have operated plants.

Q. Now, you may give the values of whatever apparatus and buildings are in the different distributing stations. The first is 63d Street?

A. It is divided in the same manner, building, connections, apparatus and holders.

Mr. Mathewson: He has described the buildings already.

1571 Q. Give it in the same way as you gave it in the operating stations.

A. Engine room, total value of buildings $1,023. No depreciation.

Valve house, $870. No depreciation.
Boiler house, $960. No depreciation.
Brick walls around property, $8,576. No depreciation.
Total value of all buildings, $11,429.

Engine room:

One 30 horse-power Morris engine, 10 by 18, reversible, without depreciation $1,430; with depreciation $1,287.

One Sturtevant exhauster with steam and exhaust connections, countershafts and pulleys and gauges, without depreciation $750; with depreciation $735.

Valve house:

One photometer, $650, no depreciation.

Boiler house:

One 66-inch by 16 feet Continental Iron Works boiler, $1,250 without depreciation; $1,125 with depreciation.

One Simplex Blake pump, 10 inches by 6 inches, $350 without depreciation; $340 with depreciation.

One Metropolitan injector with pressure gauges, pipe connections and firing tools, $45, no depreciation.

In the yard:

One duplex pump 12 by 6 inches $330 without depreciation; $314 with depreciation.

One drip water tank with 2-inch pipe connections, $350 without depreciation; $332 with depreciation.

Total of all apparatus, $4,828.

Q. You may give the value of the connections.

A. Twenty-four to thirty-inch pipe, $6,960, no depreciation. That is cast iron pipe.

1½-inch and 2-inch iron pipe, $18. No depreciation.

1572 24-inch and 30-inch valves, $909.

Total for all connections, $7,887.

Q. There is one holder there is there?

A. Yes, sir, one holder.

By Mr. **Mathewson**:

Q. And that you already valued?

A. 3,000,000 cubic feet capacity, yes, sir.

The steel work for the entire structure is $152,355.

The retaining wall, $11,090.

The brick tank constructed in rock, $256,922.

Making a total for the holder of $420,367.

Q. Describe the holder?

A. The holder is constructed in three lifts with an outer section of 184 feet in diameter; the guide frame consists of 24 steel standards, 122 feet in height. The tank is supplied with two 30-inch connections, that is, one inlet and one outlet.

Q. And you estimate the price at 7.1 cents per pound?

A. Yes, sir. It includes a permanent timber frame for the support of the crown of the holder, based upon the weight of the steel.

By Mr. **Kirby**:

Q. The tank erected in 1899 and weighs——

A. The tank was erected in 1899 and weighs 2,258,759 pounds. That is all for that station.

Q. What pressure is there on this holder?

A. Nine inches when totally inflated, all sections.

Q. When all sections are cupped?

A. Yes, sir.

By Mr. **Page**:

Q. Now, take the 65th Street. You have described the buildings already; just give us the values now.

A. Engine and valve house, $2,688 without depreciation; $2,016 with depreciation.

1573 Exhauster house, $12,350 without depreciation; $11,732 with depreciation.

Boiler house, $3,058 without depreciation; $2,906 with depreciation.

Boiler house extension, $896 without depreciation; $852 with depreciation.

All walls around the property bounded by Amsterdam and West End Avenues, 65th and 66th Streets.

By Mr. MATHEWSON:

Q. You have given the total feet and about the average height?

A. Yes, sir, I gave the sections of walls already, $33,677.

By Mr. PAGE:

Q. And those were erected in 1866, were they? I mean the buildings?

A. That one building was, I don't know about the others.

By Mr. MATHEWSON:

Q. What building?

A. The first building, engine and valve house. I suppose there was a portion of those walls erected at that time, and a large portion of it later as they extended the plant. That makes a total value of buildings of $51,183.

The WITNESS: Apparatus in engine and valve house. One Beam engine, 6 inches by 18 inches with steam and exhaust piping, $400 without depreciation; $340 with depreciation.

In the exhauster house, one 12-inch by 12-inch Rowland vertical engine, with steam and exhaust piping, $1,115.

One 30-inch McKenzie exhauster, with gauges and connections, $1,738, making a total of $2,853 for the two items without depreciation; $2,796 with.

1574 One photometer, furniture and plumbing, $1,150 without depreciation; $1,000 with depreciation.

Boiler house, two horizontal tubular boilers, 48 inches by 10 feet, $2,566.

One horizontal tubular boiler, 48 inches by 12 feet, in brick settings, $1,370, making a total for the two items of $3,936 without depreciation; $3,740 with depreciation.

One No. 2 Niagara feed pump, $60 without depreciation; $57 with depreciation.

One No. 4 Korting injector, $40 without depreciation; $38 with depreciation.

One steel stack with connections, $180 without depreciation; $171 with depreciation.

Boiler house extension, 66 inches by 14 feet tubular inside firebox boiler complete, $2,078 without depreciation; $1,975 with depreciation.

One No. 5 Korting injector, $45 without depreciation; $42 with depreciation.

Total value of all apparatus, $10,159.

Connections, 16 and 30-inch cast-iron, $12,528; no depreciation.

One 1½ and 2-inch wrought iron pipes, $128; no depreciation.

30-inch valves, $3,427.

16-inch valves, $244.

Total of all valves and connections, $20,406.

By Mr. Page:

Q. Do you take a unit of value for your pipes and valves, as you did in the other apparatus?

A. The valves are all estimated in detail, so much apiece, according to the size of same.

Q. How about the pipe?

A. And the pipe is figured at the unit of value depending upon the diameter for same, for cast-iron and for steel pipe.

1575 Q. At what price per ton did you charge for this cast-iron pipe?

A. $116, which includes the placing in position.

Q. That is the pipe laid in the yard?

A. Pipe laid in the works.

Q. Well, in the works, yes.

A. Yes.

Q. How deep do you have to lay those pipes in the works?

A. Depending upon local conditions, but in order to cover—well sometimes they are very close to the surface of the works and sometimes four or five feet down. It depends upon the drainage required for them to avoid drips. You cannot compare it with the laying of pipes in the streets, because it is an entirely different proposition.

By Mr. Mathewson:

Q. These are flanged pipes in the exhauster house?

A. In the buildings they are all flanged, and outside they are hub and spigot pipes. Holders——

Mr. Mathewson: Let us see what they want about that.

By Mr. Page:

Q. How many holders are there in this property?

A. Altogether eight holders.

Q. Take the 325,000 feet capacity holder. What is the diameter of the tank?

A. Of the tank or holder?

Q. Of the tank.

A. 94 feet diameter, 26 feet deep.

By Mr. Kirby:

Q. That is a brick tank?

A. A brick tank. All these holders are brick tanks.

By Mr. **Page**:

Q. What is the diameter of the holder?

1576 A. The outer section is 92 feet 6 inches. The holder has two lifts and a guide frame consisting of eight wrought iron columns with cast iron tops and bases. The in and outlet pipe has 20-inch connections, wrought iron pipes.

By Mr. **Kirby**:

Q. What is the thickness of the shell?

A. Of the holder?

Q. Yes.

A. No. 14 and 13.

By Mr. **Page**:

Q. What is the total height of the holder?

A. Well, it is about 50 feet when inflated. Pressure 4.8 inches when fully inflated.

Q. Now, take the two holders of 4,000,000 capacity. Will you give me——

A. Two holders of 4,000,000 cubic feet capacity, outer section 184 feet 6 inches in diameter. Holder has a guide frame of twenty steel standards 167 feet high and the pipes to the tank 36 inches in diameter. Pressure of one 12.5 inches and of the other 13.4 inches when fully inflated.

Brick tank, 187 feet in diameter, 43 feet 6 inches deep. 65 per cent. of the tank excavated in rock.

Q. Have you given the value of the holders and tanks separately?

A. Yes. Do you want the value of the holders?

By Mr. **Kirby**:

Q. Give the value of the two holders of 325,000 cubic feet capacity?

A. The value of the two holders of 325,000 cubic feet capacity for the steelwork is $55,481.

Q. And the value of the tanks?

A. The tanks are the same size and I have them all together, the whole six.

1577 Q. And the value of the four holders?

A. The value of the four holders of the same capacity is $100,920, and the two 4,000,000 foot holders are $398,645.

Q. That is with depreciation?

A. Yes, sir.

Q. In each instance?

A. Yes, sir.

Q. There being no depreciation for the two large holders, but a 3 per cent. depreciation factor for the small holders?

A. Yes, sir. Now, the six brick tanks for the smaller holders had a value of $177,547 with no depreciation, and the brick tanks for the large holders have a value of $480,280 with no depreciation.

Q. Making a total value of holders and tanks of how much?

A. $1,212,873.

By Mr. **Mathewson**:

Q. Exclusive of the engineering expenses and interest?

A. Yes, but in the instance of holder stations, the engineering charge and the other items referred to under that heading have been reduced to 5 per cent. from 10 per cent.

Q. So you stated in your testimony the other day?

A. I believe I did state it.

By Mr. **Kirby**:

Q. But the value of the holders and tanks is $1,212,873, and not the holders themselves, as is stated in the testimony, page 1386?

A. Did I state it so?

Q. The question is "What is the value of those holders? A. $1,212,873."

A. It is quite possible I did state it so, because when we speak of holders from an engineering standpoint we include the holder with the tank because the holder is not complete without the tank.

Q. Take the 111th Street station.

1578 A. 111th Street, office, $5,974 without depreciation, $5,675 with depreciation.

Exhauster house, $26,127; no depreciation.

Boiler house, $4,167; no depreciation.

Hoisting engine house, $171 without depreciation; $163 with depreciation.

Scale house, $702; no depreciation.

Stable, $11,607 without depreciation; $10,447 with depreciation.

Boiler coal storage, $583; no depreciation.

Generator house, $18,307 without depreciation; $9,154 with depreciation.

Q. How did you come to use such a large percentage of depreciation?

A. Why, that house was in bad condition and it would have required just that amount to fix it up and put it in proper condition.

Q. Do you know when that generator house was erected?

A. No, I do not, but it requires an entire new roof to put it in good condition.

Q. The office building was erected in 1871, wasn't it?

A. No, that is the scale house. Yes, 1871.

Q. And the exhauster house in 1902?

A. Yes, sir. That is entirely new.

Q. And the boiler house in 1902?

A. Yes, sir, entirely new.

Q. And the scale house about 1871?

A. Yes, sir.

Q. And the time of erection of the other buildings you have no knowledge?

A. I have not.

Wooden tool shed, $2,809 without depreciation; $2,528 with.

Retort house, $50,499 without depreciation; $37,874 with depreciation.

Foundation for old oil tanks, $4,491; no depreciation.

Blacksmith's shop, $3,006 without depreciation; $2,946 with depreciation.

All fences, $702 without depreciation.

1579 Fences around holders, $1,026 without depreciation; $923 with depreciation.

Fence around old works, 900 without depreciation; $810 with depreciation.

Brick walls on First Avenue, $703 without depreciation, $689 with depreciation.

Making a total value for the buildings of $107,981.

Now, the apparatus. Contents of office building $2,500 without depreciation; $2,125 with depreciation.

Exhauster house:

Forty-two valve stands, $651 without depreciation; $636 with depreciation.

Two number 11 vertical Root's exhausters, $5,870; no depreciation.

Two 16-inch by 16-inch Payne reversible motion engines, $3,600; no depreciation.

Two 36-inch Connelley gas governors, $4,500.

One Cochrane feed water heater, $345; no depreciation.

Steam exhaust, gauge piping, gauges, plumbing, piping, steam heating, radiators and piping, $1,610; no depreciation.

One Photometer, four closets, one toilet and wash basin, $805; no depreciation.

By Mr. Kirby:

Q. Is all that apparatus in use to-day?

A. That is perfectly new. All been erected in 1902.

Q. And is now being used?

A. Yes, and these were all figured in detail, all of these items.

Boiler house:

One guide steel stack, 4 feet diameter, 64 feet 8 inches high, $507; no depreciation.

Breech for stack, $157; no depreciation.

Three boilers, 66 inches by 16 feet, horizontal return tubular, 90 tubes each, 3 inches diameter by 16 feet long, brick setting, 1580 $5,432, no depreciation.

One Knowles pump 6 by 4 by 7 inches, $105, no depreciation.

One 1½-inch Hancock inspirator, $65, no depreciation.

Hoisting engine house:

One Ledgerwood hoisting engine, double cylinder, 8¼ by 10 inches, $1,125, no depreciation.

Scale house:

One 10-ton Fairbank wagon scale, $205 without depreciation, $195 with.

Stable:

Stable fittings and appliances, 32 stalls, office furniture and feed racks, $1,300 without depreciation, $1,105 with.

Tool shed:

Lockers, 4-beam engines not in use, one lathe and toolbins, $1,975 without depreciation, $1,778 with.

Retort house:

One stack, 16 benches, six retorts, each retort 20 feet long, $70,720 without depreciation, $53,040 with depreciation.

One stack of five benches, of five retorts, each retort 20 feet long, $20,000 without depreciation, $14,000 with depreciation.

Q. Are those retorts in use to-day?

A. They were not when I examined the plant, no, sir. It is an old coal gas works near the river side.

Q. Were they being used?

A. Not when I examined the plant, but these benches were all new, had just been rebuilt, I don't know when.

Q. Still you crossed 25 per cent. off for depreciation?

A. The arches were old and the ironwork was old. These benches can be operated at any time.

Q. But they were not being operated?

1581 A. Not when I examined the plant. They were all ready to be fired, but I don't think they had a fire in them.

By Mr. **Page**:

Q. And you don't think they had a fire in them for a number of years, do you?

A. I don't think that they did.

Q. You know as a fact that this plant is not used as an operating plant by the Consolidated Gas Company?

A. Yes, sir, it is used as an operating plant.

By Mr. **Mathewson**:

Q. You mean as a manufacturing plant?

A. I mean as a manufacturing plant, yes, sir.

By Mr. **Page**:

Q. But it could be operated if necessary?

A. Yes, sir, at any time.

Q. What is the capacity of the plant?

A. In these benches could be produced a total of 2,420,000 cubic feet of coal gas.

Q. Very well, you may proceed.

A.—

Blacksmith shop:

Various forges and tools, $350; no depreciation.

Yard:

Oil tank, 43 feet diameter by 20 feet deep, ¼-inch plates, $3,105 without depreciation, $1,652 with depreciation.

Atmospheric condenser, cast iron pipes 20 inches diameter in ten sections, $5,926 without depreciation, $4,444 with depreciation.

Q. Is there any further apparatus?

A. No, sir, that is all.

Q. There is no purifying apparatus, is there, for this plant?

A. No, sir, nothing of any kind. The gas would have to be purified at some other station.

1582 Q. What else is there that would have to be cared for at some other station?

A. Everything except one condenser, one atmospheric condenser.

Q. Then this plant could not be operated, could it, as a manufacturing plant?

A. Except with some other plant. Not by itself, no.

Q. How could you operate it with some other plant?

A. By pumping the gas to some other station and purifying and condensing it there.

Q. That is pumping it as it comes from the benches?

A. Yes, sir.

Q. Would that be a practical operation?

A. No, it would answer in a case of necessity only.

Q. Then, as a matter of fact, these are abandoned works, aren't they, and dismantled, aren't they, partially?

A. Practically, yes.

Q. What is the total value of the apparatus that would be applied to gas making at this particular station as separated from that which would be retained, treating this as a distributing station?

Mr. MATHEWSON: You asked him how much would not be used as a distributing station?

Mr. PAGE: Yes.

A. $74,914, with depreciation.

Q. That is the apparatus?

A. That is the apparatus.

Q. Now, what buildings could you do away with, as this is to be used as a distributing station merely?

A. The generator house and retort house.

Q. What figure did you value those at in this appraisal?

A. $47,028, including depreciation.

By Mr. MATHEWSON:

Q. What then would be the total valuation of the buildings which you say would not be used, and the apparatus which would not be used as a manufacturing plant at 111th Street, together, $121,941.

1583 By Mr. KIRBY:

Q. You have got some connections here?

A. Pipe connections 24-inch and 36-inch cast iron——

Mr. MATHEWSON: That is already on the record.

The MASTER: Yes, and the valuation of it.

Mr. KIRBY: He has the total, I think, but not the items.

Mr. **Mathewson**: Well, there are only three or four items.

The **Witness**: $15,950, no depreciation; 1½ to four inches, diameter, wrought iron pipes, $528, no depreciation.

All valves, $10,590. Making a total for valves and connections, $27,068.

By Mr. **Page**:

Q. Why do you have forty-one valves of 36 inches diameter?

A. They are located in the valve house and exhauster house. The gas is pumped from various stations and distributed into the new five million foot holders and there are an enormous number of large valves and connections required in this building.

Q. They are all in use?

A. They are new and in use. I have included no connections that are not in use.

Q. How about connections running from this old abandoned retort house? Are any of those included?

A. There are none included because there are no exhausters to take the gas away from that retort house. There is no other plant to which there is any connection.

Q. Go on with the holders?

1584 A. Two holders, five million feet capacity each, with steel tanks, capacity when fully inflated 14 inches. Outer section 190 feet in diameter.

Steel tank 192 feet, 9 inches in diameter.

Total height of guide frame, 192 feet. In and outlet pipes to tank, 36 inches in diameter. Total value $611,891. No depreciation.

Concrete foundation, 201 feet in diameter, 24 inches deep, for above tank, $92,846. No depreciation.

Making a total for the two holders of $704,737.

By Mr. **Mathewson**:

Q. Senator Page was not here the other afternoon when you testified that on these holder stations you allowed an engineering expense of five per cent. only instead of ten per cent.?

A. Yes.

Q. And the interest item of five per cent.?

A. Yes, sir.

Q. And of course neither of those are included in the value you have now given?

A. No.

By Mr. **Page**:

Q. Did you give the pressure?

A. I gave it as fourteen inches.

By Mr. **Mathewson**:

Q. When fully inflated?

A. When fully inflated.

By Mr. **Page**:

Q. Now that pressure, do you mean that, that it is only fourteen inches when fully inflated?

A. Yes, sir, this is rather a large diameter; therefore the pressure is less as compared with holders of smaller diameter having considerable depth.

Q. Proceed.

1585 Mr. **Mathewson**: Take up the 132d Street station.

132nd Street Station:

Governor and boiler house, $26,736. No depreciation.

Q. The building has just been erected?

A. Newly been erected. I figured that in detail and my price was less than what they paid for it, and I could not come up to the price they paid for it entirely. I figure that building three or four times. You see these question marks here?

Q. You tried to approach their limit?

A. I could not do it.

Mr. **Mathewson**: You put it down as your estimate although it was less than what we paid for it.

The **Witness**: I thought I made a mistake. I figured it half a dozen times and I could not make it, and I let it go as it was.

Boiler chimney, $3,040. No depreciation.

Total for the building, $29,776.

Apparatus in governor and boiler house:

One No. 11½ vertical exhauster, 122 cubic feet capacity, with flexible coupling, $2,910. No depreciation.

One 6½ by 24 horizontal Buckeye engine, $3,010; no depreciation.

One 24-inch Connelly gas governor, $1,375.

Three B. & W. boilers and two batteries, $8,000; no depreciation.

One 6 by 4-inch Knowles duplex plunger pump, $143; no depreciation.

One No. 6 Cochran feed water heater, $505; no depreciation.

One No. 10 steel-plate breeching, $750; no depreciation.

1586 One 3-inch Crown water meter, $165; no depreciation.

One No. 12½ Metropolitan injector, $78; no depreciation.

One blow-off tank, 3-inch diameter, 10 foot long, $73; no depreciation.

One 8-inch Hudson exhauster head, with steam exhaust water and gauge pipe, $1,885; no depreciation.

Toilet and wash basins and plumbing, $85; no depreciation.

Total for apparatus, $18,979.

Q. All brand new apparatus purchased within the last year?

A. All brand new apparatus.

By Mr. **Page**:

Q. On all this apparatus did you get the prices that the company paid, or is it your estimate?

A. My estimate, the same as in the instance of the buildings. I obtained the prices myself from the various manufacturers where they were standard articles, such as toilets and wash basins.

Q. Did you find from the various manufacturers just what they had furnished this particular station for?

A. No, I went to the station and found out what they paid.

Q. And then you went to the manufacturers and asked them what they really received?

A. No, I asked them what they would furnish me such an engine or such an exhauster for, and more than that, I asked them to give me the benefit of the manufacturer's price, and they thought it was for my firm, and they would give cheaper prices than the gas company paid.

Q. What prices did you put in here, the cheaper prices?

A. Yes, the prices I obtained from them.

1587 Connections, 20 to 36-inch cast-iron, $43,291; no depreciation. All valves, $4,423; no depreciation.

Total for all connections and valves, $47,714.

Gas holder, one holder, 5,000,000 cubic feet capacity in five lifts, outer section 180 feet 6 inches diameter, steel guide frame consisting of twenty steel standards 192 feet high, crown supported with permanent wooden frame, in and outlet pipe, two sets each of 36 inch diameter for steel tanks; total value of holder and steel tank with guide frame complete, $346,915. Foundation for same of concrete, 203 feet diameter, 24 inches deep, with footings of an average depth of 20 feet below grade, and retaining wall 15 feet deep; total value, $47,050 without depreciation; making total value of holder and foundation $393,965, which does not include 5 per cent. engineering and 5 per cent. interest charges. Total for the entire station, including those charges, $514,955.

Q. The holder and the tank being new?

A. Yes, I believe that is all.

By Mr. **Page**:

Q. I understand that all these values have to have added to them in your estimate something for engineering charges and something for interest?

A. Yes.

Q. How much for engineering?

A. Five per cent.

Q. What does that include?

A. All the items referred to under the plants where the reduction was made on account of the simplicity of the structure as compared with the difficulty of examining an entire plant consisting of a great many buildings with so many connections and details. This was very much simpler and therefore I could not overlook so many items as in the other instances.

Q. When a company has built one five million cubic feet
1588 capacity plant they don't have to get up new plans and
have new engineering problems to work on in another one identical with it, because it is located in another part of the city?

A. Yes, they have to arrange their valve house and connections and machinery for this station to suit the locality that it is in. It is never alike in two different locations. It has to be adapted and suited to that particular location, and therefore, they have to make new plans and have new expense for engineering and preliminary expense for their grading, and all that sort of business in each instance.

Q. This item of 5 per cent. interest—did you take that for one year? Or, how long does it take to construct a steel tank boiler?

A. Well, I constructed the holder and it took two years.

Q. It took you two years to construct the steel tank at 132nd Street, did it?

A. From the time we had the order until we completed it it was about two years.

Q. From the time you commenced to make deliveries and do work on which you were drawing payment, it was not two years, was it?

A. Yes. Well, not quite. The total time from the time that the contract was placed until the order was finished was practically two years.

Q. It is generally estimated that it takes two years to build a brick tank holder and one year to build a steel tank holder, isn't it?

A. Well, it takes one year after we get hold of the foundation. In this instance there was a great deal of excavation and a deep grade had to be made and a great deal of retaining work had to be done by sheet piling and packing to keep the banks intact until we could get hold of the foundation. That consumed an enormous amount of time before we could construct the steel tank, although we had the material there on the ground, and of course the gas company made payments as fast as the material was shipped.
1589 The first material was shipped probably two months after receipt of the order, and the necessity of that is because the manufacturer cannot accumulate all the maetrial that is finished in his shop. It is delivered as soon as he finishes it.

Q. You have stated somewhere that the cost of filling and testing a tank was a part, and went in to make a part of the 5 per cent. engineering item?

A. Yes; the water for filling the tank is always paid for by the gas company and never by the contractor.

Q. And the method of testing a holder and a tank is to fill the tank with water and pump in air? Is that it?

A. Yes, for the preliminary test.

Q. Then after that test is satisfactory and the holder is accepted they exhaust the air and put the gas in immediately, don't they?

A. Yes; that is, we open the manhole plate on top of the holder and let the air out.

Q. They don't draw off the water—they use the water then right straight along?

A. Yes, that same water remains in right straight along; there is only one charge for the water.

Q. That is charged up to the expense of operation, isn't it?

A. No, I have charged it in my valuation of the cost of the tank.

Q. I know where you charge it, but the company will charge it up as part of the cost of operation, won't they?

A. No, sir, because it is not an operating expense; it is a holder expense, presumably for the reason that a holder cannot be used until it is filled with water, and the expense is only once, and therefore cannot be counted as operating expense. It is not a continuous expense.

Q. If the company should charge it in as such it ought to be eliminated?

A. Yes, it cannot be charged twice.

Inwood station, exhauster and valve house, $3,330 without
1590 depreciation; $3,230 with depreciation.

By Mr. Kirby:

Q. Erected in 1886?

A. Yes.

Apparatus, one 6-inch McKenzie exhauster, 6-inch connection; one Smith and Sayre vertical engine, 4 by 6 inches; one 12-inch governor; one upright tubular boiler, 3 feet by 6 feet high, containing 52 one and one-half inch diameter steam connections, piping, steam fitting, steam and gas pressure gauges, one Cameron pump 3 inches by 5 inches. Total value of all above apparatus, allowing for depreciation, $1,640. Erected in 1898.

Q. No depreciation being for over 5 per cent.?

A. Yes, I gave that, allowing for depreciation.

Connections, 6 to 12 inches, $650; no depreciation. Those are cast iron.

One to 12-inch wrought iron connections, $18; no depreciation.

Valves, $255; no depreciation.

Total for connections and valves, $923.

One holder, 60,000 cubic feet capacity, in two lifts. Outer lift 40 feet diameter, 20 feet 6 inches deep, steel guide frame standards consisting of eight steel column standards with latticed steel bracing and tie rods, 12-inch inlet and outlet pipes for tank; 6-inch pressure when fully inflated; value, $11,882 without depreciation; $11,288 with depreciation.

Brick tank for same, concrete foundations, 47 feet in diameter, 21 feet 4 inches deep, $6,660; no depreciation.

Total for holder complete, $17,948. Did we give the total for the station before?

Mr. Mathewson: Yes, I think you did.

Q. All such buildings and apparatus are used for the dis-
1591 tribution of gas and not in its manufacture?

A. Yes, sir.

Mr. Mathewson: That was the Inwood station?

A. That was the Inwood station.

Q. Now, let us start with 14th Street and give the total value of each holder.

The Master: Subdivide the holders.

The Witness: 14th Street holders; six holders, 345,500 cubic feet capacity, constructed in two lifts with outer sections 95 feet diameter by 26 feet deep. Total value of holders, $152,052; pressure varying from a minimum of 4.55 to 4.95 inches when fully inflated.

Two holders of 250,000 cubic feet capacity each, 86 feet in diameter, constructed in two lifts, with an outer lift of 84 feet in diameter; total value with depreciation, $46,882. Pressure when fully inflated 4.75 inches.

Brick tanks for above holders, six tanks 97 feet in diameter by 26 feet deep with pile foundation, $219,039; no depreciation.

Two brick tanks, 86 feet in diameter by 26 feet deep with pile foundations, $57,383. Making a total for holders complete, $475,356.

Forty-second Street station, four holders, 250,000 cubic feet capacity, each constructed in two lifts with an outer lift of 95 feet 1½ inch in brick tanks; total value for the three holders with depreciation, $103,206. Pressure when fully inflated, 4.4 inches.

Four brick tanks for the above holders, 96 feet 10 inches diameter, 21 feet 6 inches deep, constructed on pile foundations, $120,384 with depreciation.

One steel tank holder 20 feet in diameter by 10 feet high.
1592 That holder is not in use at the present time. It can be used
because it is connected and ready for use. The value of that holder is $2,800 without depreciation, and $2,188 with depreciation, making a total for all holders at that station of $225,778.

44th Street station. 4 holders, 375,000 cubic feet capacity, each constructed in two lifts with an outer lift of 89 feet diameter by 30 feet 6 inches deep pressure, when fully inflated 6 inches. Value of four holders with depreciation, $111,946.

One holder 2,000,000 cubic feet capacity in two lifts, 181 feet in diameter by 42 feet high. Total value allowing for depreciation, $104,982.

Two holders 125,000 cubic feet capacity each, single lift, 72 feet 6 inches in diameter, 5.5 inches pressure, which is the value allowed for depreciation, $15,480. The other holder is 6 inches pressure and its value with depreciation is $16,690.

Four brick tanks for the 375,000 cubic feet holders constructed in rock of the value of $214,747. The brick tanks for the 2,000,000 feet holders, is 185 feet in diameter by 41 feet 5 inches deep, constructed in rock and has a value of $276,269.

Two brick tanks, 75 feet diameter by 32 feet deep for the 225,000 cubic feet holders; they have a value of $74,815, allowing for depreciation, making a total for all holders at that works, $814,929.

21st Street station:

Four holders each of 400,000 cubic feet capacity in three lifts, pressure 8.7 inches, outer section 88 feet in diameter, 16 cast iron columns, standards and guide frame, total for the four holders, $201,848.

One holder, one and one-half million cubic feet capacity in two lifts.

Upper lift, 165 feet 8 inches diameter, pressure when fully inflated
5.9 inches, total value, allowing for depreciation.
1593 & 1594 $84,314.
Four brick tanks for the 400,000 cubic feet holders, total value, $125,708.

Brick tank for the one and a half million cubic feet holders, 171 feet diameter by 37 feet 2 inches deep on concrete foundations, $139,970; making a total for all the holders in brick tanks at that works, $561,840.

99th Street station:

Two holders, 600,000 cubic feet capacity in three lifts.

Outer lift 100 feet in diameter, pressure when fully inflated, 7.2 inches. Total value of both holders $59,674 without depreciation.

One holder 300,000 cubic feet capacity in two lifts with an outer section 88 feet, having a total pressure of 4.5 inches, value $24,914.

One holder 100,000 cubic feet capacity in one lift, 67 feet diameter, 4.25 inches pressure; total value without depreciation $12,271. Total for the four holders above referred to $156,533 without depreciation. With depreciation $140,880.

Two brick tanks for the 600,000 feet holders each $35,954.

Brick tank for the 300,000-foot holder, $28,830.

Brick tank for the 100,000 feet holder, $20,488.

All of these brick tanks are constructed on pile foundation.

Total for all brick tanks, $121,226, allowing for depreciation.

At 6.05 P. M. adjourned to Tuesday, September 4th, 1906, at 1 P. M.

Last Exhibits:

Complainant's 233.
State's N.
City's 34.

1595 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, TUESDAY, September 4, 1906—1 o'clock p. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Burr, Mr. Kirby.

1596 FREDERICK J. MAYER, being further examined, testified as follows:

Cross-examination by Mr. PAGE (continued):

Q. Will you take the five million-foot holder at 132d Street, and give me the various items, and how you arrive at the value, beginning first with the tank?

A. The entire weight of that holder is 5,256,280 pounds, of steel of various character, and the total price per pound figured for that holder under present conditions is 6.6 cents per pound, and that 6.6 was made up from the following factors: Material, 2.2 cents per pound; freight, .20 cents; drayage, .10 cents; shop labor, .73; labor, 1.28; total, 4.57 cents per pound. To which must be added for operating expenses 15 per cent., or .68 cents per pound, and for miscellaneous expenses .46 cents per pound, making a total of 5.71 cents. Then a profit of 15 per cent., equal to .85 cents per pound, making a total of 6.56 per pound, for which a price was applied of 6.6 cents.

Q. When you add the value of this holder into the rest of the apparatus, then you add another ten per cent., don't you?

A. No, 5 per cent., in the interest of holder stations.

Q. Besides the 10 per cent. which you had allowed here for miscellaneous expenses?

A. Only for the holder proper; that is, 10 per cent., which is the manufacturers' 10 per cent. in the instance of the cost of the holder.

Q. Have you given here the tank or the holder?

A. The tank and the holder, complete, all steel work.

Q. Where do you get the item allowing for rivets in the computation which you have made?

In the item of material at 2.26 cents per pound. That 2.26 cents is made up from the following factors: Do you want me to give the detail prices of those?

1597 Q. I would like to have them, yes.

A. Open Hearth Steel plates, 1.83 cents per pound; flange steel, 1.93; sheet steel, 1.93; gas holder steel, 2.05; steel rib plates, 3 cents; universal steel plates, 1.83; steel angles, 1.93; steel channels, 1.93; steel I-beams, 1.93; flat steel bars, 1.73; steel beads, 1.73; double steel beads, 2.03; steel checkered plates, 3 cents; round steel bars, 1.73; steel tees, 1.83; tank rivets, 2.05; gas holder rivets, 4.25; boiler rivets, 2.75.

Q. How did you estimate the labor? You have given two elements of labor, haven't you?

A. One is shop labor and the other is erection labor. That is based on actual conditions as they exist at the present time, taken from my construction accounts.

Q. I suppose the labor item would be divided into ordinary labor and skilled labor, would it not?

A. Yes, sir.

Q. How much do you allow for ordinary labor?

A. That varies, of course, in the shop from those in the field. Shop wages are,. for riveters, $2.50 per day; rivet helpers, $1.62; holders on, $1.62; rivet heaters, $1.26; template makers, $3.50; fitters, $3.25; machinists, $2.70; machinists's helpers, $1.62; fitters, $3.00; pipe fitters, $2.79; pipe fitters' helpers, $1.75; carpenters, $2.75; pattern makers, $3.25; pattern makers' boys, $1.50; molders, $3.00; core makers, $2.50; helpers, $2.00; boys, 84 cents; ordinary laborers, $2.00 per day.

Q. How many hours to a day's work?

A. Eight hours. No, it is nine hours in the shop and eight hours in the field. That is all shop wages that I have given you just now.

By Mr. MATHEWSON:

Q. Field wages are the wages used in setting the apparatus, you mean?

A. Yes, at the point of construction, assembling and construction.
Foremen, $5 to $6 per day; boiler makers and caulkers, $3.20
1598 a day; riggers, $3.20; holders on, $2.50; heaters and helpers,
$2.00; laborers, $1.75; blacksmiths, $3.50; mechanics, $3.00; helpers on apparatus, $2.00 to $2.50; carpenters, $4.80. Now, I have got the labor for erecting the permanent timber frame which is located on the inside of the tank, and which supports the crown of the inner construction, all steel plate. The labor is $16.50 per thousand feet of timber in the frame, and the labor for erecting of scaffolds is $7.25 per thousand feet of lumber in the frame. Housesmiths, $4.50.

By Mr. PAGE:

Q. Where do you get your figures of labor cost?

A. From my construction accounts.

Q. The construction accounts of Bartlett, Hayward & Company?

A. Yes.

Q. Are those the rates of wages that you figure in as a co-efficient when you bid on a tank?

A. Yes, absolutely the same.

Q. Bartlett, Hayward & Company built the gas holder at 132d Street, didn't they?

A. Yes, sir.

Q. And have you taken those figures that you have given here from the estimate or contract price which you gave to the Consolidated Gas Company?

A. No, sir, I have applied the figures as they exist to-day.

Q. In making that application does this holder in total cost come to more or less than the figure which you gave to the Consolidated Gas Company?

A. I think the figure comes to more for present conditions. The figure given the Consolidated Gas Company for the 132d Street holder was a particularly low one for the reason that at that time we had under consideration the construction of four holders of the same
capacity, one for the Consolidated Company, two for the
1599 Standard Company and one, I think, for the Mutual Com-
pany, if my memory serves me correctly, representing four times the amount of weight for which we were able to place an order with the mills, and under which conditions we of course received a special and a low price.

Q. Then, if you were called upon to erect all the holders of the Consolidated Gas Company now at one time you would make a much lower figure per holder?

A. Well, all the holders are somewhat of different material, so I could not hardly include that under similar conditions which I outlined just now.

Q. Under the theory under which you have been giving testimony, that you are giving the price that it would cost to reproduce these holders new to-day, if you had that contract to reproduce all those holders at one time you would figure a much lower price on each holder than you have given here to-day, wouldn't you?

A. As I say, all the holders would not come within the limitations of the conditions which I outlined just now, because it would require a great many years to construct all of them, but for the four or five of them which could be constructed within two years, I could control the price of material for that length of time; beyond that it would be impossible.

Q. How many holders of five million feet capacity has the Consolidated Gas Company; do you recall offhand?

A. No, I do not.

Q. This holder at 132d Street has just been completed, has it not? Gas has been turned in since this hearing, hasn't it?

A. No.

Q. This year?

A. It was before that.

Q. Not since you have been here, but I believe that Mr. Bradley testified that it would be turned on that day that he was here.

A. That I do not know; I thought you referred to the time that I have been here.

1600 Q. I understand that in giving this estimate of what it would cost to reproduce this contract, you paid no attention to the figures that actually went to make up the cost, but you have proceeded under this theory of estimation of yours, which produces a much larger result?

A. I do not know that it is much larger. I do not know just what the figure was for those four holders, but these are the conditions as they exist to-day and which will have to be applied for to-day's reproduction.

By Mr. Mathewson:

Q. If you were to make a contract to-day.

A. If I were to make a contract that would be the figure.

By Mr. Page:

Q. If you were asked to make a contract to-day on four holders of 5,000,000 feet capacity, you would make a contract for much less per holder than the figure you have given, wouldn't you?

A. I would not say much less; it would be the conditions of labor as they are to-day, because that could not be changed.

Q. It would be as much less than this 132d Street holder actually cost, than it cost under your theoretical scheme?

A. Less the difference in existing prices of to-day as compared to those for labor and for material both; there is a direct increase in both for present conditions.

Q. I thought you said that within the last two years there has been no material increase or decrease in the rates of steel or labor, didn't you?

A. If I remember my testimony correctly, I think I stated that the material at present was perhaps slightly less and the labor slightly more, so that one would compensate the other approximately.

1601 Q. It would amount to about the same thing?

A. Yes; now, when I speak of labor I mean total labor for the entire construction Of course you understand that the wages are very much higher at present than they were at that time.

Q. At what time?

A. In 1903 and particularly 1904. From 1903 to 1904 the rates were jumping very fast.

Q. When did they cease to jump—in 1904?

A. They have not ceased to jump yet, and God only knows when they will, nobody knows.

Q. Then, as I understand you, as labor jumps up, material jumps down, so that they keep about an equilibrium?

A. Not absolutely. No, that was merely an opinion that I gave you off-hand, because I had that condition in my mind at the time I said that. I believe that it is approximately correct. For instance, the reason that the total cost of labor is less at the present time than it was in 1903, is due to the fact that we were compelled to improve our field machinery in order to offset the constantly increasing demand for wages.

Q. That has been the experience of every line of manufacture, hasn't it?

A. Yes, I presume so.

Q. That is, as wages increase the inventive genius of man on the other hand produces labor saving machinery and therefore we arrive at the result that we can produce cheaper although we pay more for labor?

A. Yes, I presume that the same conditions exist in other branches of business the same as ours.

Q. Now, if you will turn to the four million capacity tank at 65th Street, that is a holder with a brick tank?

A. Yes, sir; two holders, each four million feet.

Q. Now, will you give me the elements of cost that enter into the production of the tanks?

A. The total weight of the two holders—that is, steel work and iron work I refer to—is 5,614,720 pounds. The unit price is 7.1 cents a pound, making a total of $398,645. 1602

Q. You give for that as a unit figure 7.1 cents per pound?

A. Yes, sir.

Q. Is there any allowance there for excavation?

A. No, that comes in the cost of the tank.

Q. That is what I asked [illegible] for—the tank?

A. The tank alone?

Q. Yes; I want the tank first.

A. The two tanks cost $480,280.

Q. For what?

A. They are brick tanks excavated for 65 per cent. of the depth in rock.

Q. How much do you allow, how many cubic feet of rock and at how much per cubic foot, if that is what you estimated, or per cubic yard?

A. The total cost amounts to 20.1 cents per cubic foot, figuring the bottom as being horizontal.

Q. The bottom is not horizontal?

A. No; but it does not make any difference in the application of a unit factor if you figure them on the same basis.

Q. How many million feet do you make it that you excavated there?

A. I estimated another holder, which had a brick tank of 170 feet in diameter by 38 feet 9 inches in depth; this tank was 187 in diameter by 43 feet 6 inches in depth; so that the general dimensions did not differ materially. And in the other instance I found that the excavation amounted to 38,420 cubic yards. That, figured at $1.50 a yard——

Q. Is that in rock?

A. No, in earth. The back filling amounted to 9,452 cubic yards at $1.50; the concrete, 1,462 cubic yards, at $7.00. The brick, 1,618,000, at $25.00, laid; the stone landing piers at $3.50 per cubic foot.

Q. And how much per cubic foot for your landing stones?

1603 A. $3.50. That is granite, $3.50 per cubic foot. Now, the total cost of that tank, assuming the bottom to be flat, is 14.4 cents per cubic foot. If it would have been rock excavation for the entire depth it would have added $2.00 per cubic yard, which is equal to 8.7 cents per cubic foot. That would have made a total of 23.1 cents per cubic foot, completed work. In this instance I have applied the difference between the total and 65 per cent. of rock excavation, making the figure, instead of 23.1 cents, 20.1 cents.

Q. Was there any granite coping?

A. Yes, sir, that is included. Eighteen pier copings, 457 feet of stone coping: that is all included in that price of $3.50 per cubic foot.

Q. Is that not a pretty good price for that?

A. That is the price that I obtained from the builders; that is extraordinary size——

Q. What kind of granite did you get—imported Scotch granite?

A. No; any kind that can be gotten under local conditions; if that can be got and used, it will answer the same purpose.

Q. It was not a fancy granite, then?

A. No, sir.

By Mr. Mathewson:

Q. What did you say about large blocks or size?

A. Its thickness is from 3 to 4 or 5 inches—about equal to that of copings and landing piers, and the price was given on that basis.

By Mr. Page:

Q. Did you have any anchor bolts there?

A. They are in with the steel work of the holders.

Q. You figured those at 7.1 cents?

A. That and the pipes inside of the tank, as well as the guide rails and anchor bolts for the guide rails.

Q. Is your estimate given on the basis that you would reproduce these two tanks together new?

A. Yes, sir.

1604 Q. Have you made any allowance because of a wholesale rate on two tanks rather than one?

A. No, I figured upon actual cost, so much per thousand cubic feet of work, so it does not make any difference whether it is one or two.

Q. Wouldn't you, if you were bidding on two tanks to be erected side by side, make a cheaper bid than you would if you were to bid on one tank? Two tanks exactly similar, and the holders?

A. I would not make any allowance or reduction in price on account of building two tanks, but the circumstance of building two tanks right close together diminishes the price as compared with the erection of two single tanks in different localities, because there is less excavation for the two tanks so located. In constructions of this kind, where there is no shop work to be estimated, you cannot take that into consideration.

Q. How about the holders?

A. It is different with the holders. You would have a certain amount of saving in your shop work, because a great deal of the head work and other work performed in the shop would be applied to the two holders as well as to one.

Q. But in making this estimate you have given us here, you have treated it as if you were building two entirely distinct tanks at different times.

A. I did, yes, sir, for the holders.

Q. Yes. And that is so with your estimate of every bit of apparatus you have testified to?

A. No, I would not say that.

Q. Not taking into consideration the fact that you could buy a large quantity of it at one time at lower prices than you could a single machine.

A. No, I cannot base an estimate of this character upon that, but you can in an estimate for a contract, when you know that the conditions actually exist at the time you make the contract.

1605 Q. Well, I suppose that if you could not, you mean you did not.

A. I did not; besides which I do not know that these two holders were built at the same time. They may have been built at different times.

Q. But to-day you are building them in your mind at the same time?

A. Yes, but not all at once.

Q. Yes.

A. It would take a good many years to build all these holders.

Q. It only takes a few minutes to reproduce these gas holders here. Now as I understand you, in examining the 14th and 42nd Street plants, for instance, you did not take into consideration whether they were commercially or economically worth replacing, did you?

A. No, sir; I only figured on what I found there.

Q. That is what it would cost to reproduce that apparatus, whether or not it was commercially and economically an apparatus that would be built to-day?

A. I paid no attention to that whatever.

Q. And did you take into consideration whether gas could be reproduced at those particular plants at $1.50 or 50 cents per thousand cubic feet?

A. I did not consider it at all because it had no bearing whatever on the apparatus as I found them.

Q. As you valued it?

A. As I valued it.

Q. Now where a plant was of an old type which, owing to the advance in the science of gas engineering, would not be built to-day, did you allow anything for depreciation by reason of that fact?

A. No, sir.

Q. Where an apparatus was obsolete and not in use, but was standing in place, did you estimate that according to real value, or did you estimate what it would cost to reproduce that apparatus new to-day?

A. I don't recollect any apparatus that was obsolete; there were a good many that were not in use owing to the season of the
1606 year, where the demands on the production is less than at other times of the year.

Q. Will you tell me to what use you can put the hydrogen scrubber that is at the 99th Street plant to-day, what use can you make of a hydrogen scrubber to-day?

A. Well, it can be used for the scrubbing of water gas as they make it to-day.

Q. The hydrogen scrubber was a portion of the old Tessie du Motay plant, wasn't it, when they used to manufacture a hydrogen gas separately and interject it into the make of the water gas?

A. Yes, sir.

Q. And it is an apparatus that has been abandoned for years, hasn't it, and supplanted by several different processes since?

A. Well, but the scrubber of the Tessie du Motay, or any other carbureted water gas process can be used in connection with the U. G. I. as well as anything else.

Q. What did you use it for?

A. For the elimination of mechanically suspended impurities which exist in both processes. The process has nothing to do with that kind of imperfection.

Q. You find in this 99th Street station that they have the necessary scrubbers outside of the hydrogen scrubber, haven't they?

A. Yes, sir.

Q. Would there have to be any alterations made in the scrubber to use it to-day?

A. Well, it is quite possible that in the designing of the scrubbers for the U. G. I. apparatus it was taken into consideration that this scrubber should be used.

Q. Is it used? I think you have it marked as not in use.

A. I presume it is used when they make the full amount of gas.

Q. Will you turn to your data of the scrubbing apparatus and compute the amount of scrubbing surface that you have, if you call it such, and see if that is sufficient to take care of the production at that particular plant without the use of this hydrogen

1607 scrubber?

A. I haven't got all that data here with me.

Q. Turn to the 99th Street plant.

A. Two hydrogen scrubbers 28 feet high?

Q. I thought you only had one, but I see you have two there.

A. Two.

Q. Take the other scrubber, you say "out of commission"?

A. I say it was out of commission when I examined the plant.

Q. Are they connected with anything?

A. Yes, sir.

Q. What are they conected with?

A. With the pipe system.

Q. Where does the pipe system lead to?

A. I presume now it leads to the tank of the U. G. I. process.

Q. You say you presume. Do you know?

A. I cannot recall it now. I have examined so many plants I would have to examine that particularly if you want me to give an intelligent answer.

Q. What did you mean when you said out of commission? You did not say not in use, but out of commission. That is what we say when a thing is laid up and abandoned practically, isn't it?

A. It is not abandoned, it is laid up for the present, but not abandoned. You will find that same remark about several other apparatus. It means out of use temporarily.

Q. Take the other scrubbers you have up there and see whether you have enough to do the business?

A. There are two more scrubbers above that of the same size.

Q. Two hot scrubbers?

A. Two hot scrubbers, yes, sir.

Q. Those are 21 feet high and 8 feet 6 inches in diameter?

A. Yes.

Q. How much gas would those two scrubbers take care of?

A. 243,000 cubic feet in 24 hours.

1608 Q. Will you give me your calculation on that?

A. I know it takes five cubic feet of volume for each thousand cubic feet of gas passed in 24 hours.

Q. Are there any scrubbers up there in that plant?

A. There are two more up there 10 feet in diameter by 24 feet high.

Q. Take those up.

A. Do you want the capacity of those?

Q. Yes.

A. 384,000 cubic feet in 24 hours.

Q. And the other was what?

A. 243,000 cubic feet

Q. Now, if we multiply each of those by two and add them together we will get the answer to the question that I asked?

A. There are more scrubbers. 1,254,000 cubic feet. There are more scrubbers there.

Q. Well, give us those?

Mr. Mathewson: Does that include the hydrogen scrubbers?

The Witness: No, we can take those next.

Q. No, do not take the hydrogen scrubbers. Leave those out.

A. I don't find any more except the two hydrogen scrubbers.

Q. Now give me the capacity of the two hydrogen scrubbers?

A. They are about the same as the others, I guess.

Q. Then it is about the same?

A. They are about the same as the two hot scrubbers. That makes 1,740,000 cubic feet per day in those scrubbers that I have named.

Q. What is the capacity of this plant at 99th Street?

A. 5,500,000 cubic feet.

Q. Then you could not pass the total production of the plant through the scrubbers, could you, if you have only got 1,740,000 cubic feet?

1609 A. Well, in addition to these there are additional scrubbers, I assume, in the U. G. I. apparatus, or whatever they furnish in connection with the apparatus.

Q. When you buy a set of U. G. I. apparatus, it includes, does it, the generator, carbureter, the superheater and the scrubbers and condensers necessary?

A. Not always.

Q. Does it in this case?

A. I was just looking when you asked the question.

Q. Have you so estimated it here?

A. No, I find no scrubbers there.

Q. I asked you when you were considering this plant whether you found there the necessary scrubbers, condensers and purifiers to produce the full capacity?

A. Yes, sir.

Q. You said you did. Now then, how do you explain the fact that there are only scrubbers sufficient to take care of 1,740,000 cubic feet per day, when the capacity of the works, according to the generators, is 5,500,000 cubic feet per day?

A. That is on the basis of my applying a figure of five cubic feet per thousand cubic feet of gas being passed through that apparatus. They evidently are passing it through with much less volume and get the same result.

Q. Then your computation is wrong as to the capacity of the scrubbers, isn't it?

A. No, not necessarily. You cannot scrub that gas too much. I should provide a larger scrubbing capacity, but that is all that I have included there.

Q. When you took the unit of five feet, on what did you base it?

A. On my experience that is what I should apply.

By Mr. Mathewson:

Q. Is that a coal gas or water gas plant at 99th Street?

A. Coal gas.

Mr. Page: No, it is water gas.

1610 The Witness: That is right. That is where I made my mistake. It is water gas.

By Mr. **Page**:

Q. Now, water gas, how much do you pass through the scrubber in a day?

A. Well, the scrubbers in water gas are required very much smaller than those for coal gas. We take out certain impurities in the water gas and in the coal gas we take out ammonia.

Q. What unit would you apply as a unit to the water gas plant?

A. Well, it is a very small cubical part, perhaps one and one-half cubic feet per thousand, up to two feet per thousand. It is not very material in the water gas.

Q. Now will you make your calculations then on the four scrubbers, ignoring the hydrogen scrubbers?

A. As to capacity?

Q. Yes, as to capacity for water gas.

Mr. **Mathewson**: At the rate he has indicated, I suppose?

Mr. **Page**: Well, the correct rate, if he has got it there.

Mr. **Mathewson**: There isn't any correct rate. Some works do not use any.

The **Witness**: Oh, no, it is very immaterial with water gas.

Mr. **Mathewson**: In coal gas you have to have a fixed proportion. In water gas you do not.

Q. And it don't make much difference how large your scrubber is?

A. No, it doesn't, because you regulate with the amount of water or material you have inside for filling.

1611 Q. Then certainly these four scrubbers can take care of whatever is produced there without any regard to the hydrogen scrubbers, can't they?

A. Well, I wouldn't say that.

Q. Well, if it does not make any difference what the size of your scrubber is, certainly if you have got two big scrubbers like these or four big scrubbers, they would take care of this capacity?

A. You have got to have enough, of course, for a minimum capacity.

Q. Now, have you enough for a minimum capacity in those four scrubbers?

A. I wouldn't say that they have.

Q. Well, if you were going to build a water gas plant, you would have some idea what a capacity of scrubber you would have to have for 5,500,000 cubic feet.

A. I was just trying to figure that for water gas. Well, (after figuring) it will be on the basis of from one to one and one-half, it will be on the basis of 4,500,000 to 6,000,000, averaging about 5,000,000. It is not very material what the size of a scrubber in a water gas plant is. Of course you have got to have a certain minimum capacity.

Q. Then in these four scrubbers, excluding the hydrogen scrubbers, you certainly have sufficient to take care of the production of that plant, haven't you?

A. Well, as I said before, I wouldn't say that positively.

Q. Well it is somewhere between four and one-half and six millions you say?

A. Yes, sir.

Q. And the capacity of the plant is 5,500,00?

A. Yes, sir.

By Mr. **Mathewson**:

Q. Then how do you figure it out there would be sufficient if it is four and one-half million and the capacity of the plant is five and one-half million.

A. Well, from four and one-half to six.

1612 Q. No, according to whether you took one or one and one-half. It is according to the kind of coal, how much gas you get in passing through the apparatus. Some require more. If you use coke it is a different capacity than coal.

By Mr. **Page**:

Q. Well, coke makes more ashes than hard coal.

A. Some does and some don't.

Q. Where are these hydrogen scrubbers located with reference to the generating plant and with reference to the balance of the plant.

A. Thy are not very far from the other scrubbers in the yard. They are both in the yard. Both the hot scrubbers and the hydrogen scrubbers.

Q. Are they both on the same side of the generating plant?

A. What is this, 99th Street?

Q. Yes.

A. No, I think they are all on the opposite side.

Q. No, I say are the scrubbers that you testified to and the hydrogen scrubbers both on the same side as the generating plant?

A. Well, what I meant is, they are on the opposite side of the yard from where the generator house is. All the scrubbers are together on the opposite side of the yard.

Q. But as related to the generator house, they are all on the same side?

A. All on the same side, yes, sir.

Q. You have given considerable testimony relating to yard connections. How did you measure those up?

A. Partly on the plans and partly on top of the ground.

Q. Wherever the pipes were on top of the ground you actually measured them, did you, you and your assistants?

A. No. I mean I took the measurements on top of the ground of all the pipes located below the ground.

1613 Q. Of course where a pipe was visible, did you measure that pipe?

A. Yes, sir.

Q. And where a pipe was covered, you took some plans that were furnished you?

A. Partly, and where there was no plan, I took the direction of the pipe indicated by the point where it entered the ground and the point where it came out of the ground.

Q. Can you recall whether there are any pipes shown on the plans, running from the generating apparatus to these hydrogen scrubbers?

A. In 99th Street?

Q. Yes.

A. As near as I can remember, the pipe in the generating house was all overhead, and then it turned down at the end of the generator house to a point below the ground and extended across the yard underground, then came out of the ground and connected to these scrubbers which were in the yard on the opposite side from the generator house.

Q. And they would connect with the scrubber at the top, would they, or at the bottom?

A. The bottom. That is, the inlet to the scrubber was at the bottom of the apparatus.

Q. And the water comes down?

A. Yes, sir.

Q. And at the top there is a pipe to carry off the gas in the scrubber?

A. The same pipe extends through to the top of the scrubber, then goes to the outlet of the pass and becomes a by-pass in connection with a second pipe.

Q. Do you remember whether these hydrogen scrubbers were connected at the top?

A. As near as I can remember they were connected with a common pipe across the top.

Q. Common with what?

A. Common to all the scrubbers.

Q. Were there any valves to cut off the——

A. Yes, sir. The necessary inlet and outlet and the apparatus to form the by-pass.

1614 Q. Where did you get your information to put these scrubbers down as "out of commission?"

A. That simply indicated they were not in use at the time of my investigation. Some of the men used the words "not in commission" and others "not in use," and it was just an expression that they were not in use at that time, depending upon the man who made the investigation at that plant.

Q. Did you find all of these scrubbers in operation?

A. Yes, sir, only when they are marked otherwise.

Q. When did you make your examination?

A. Well, during the last seven weeks.

Q. Was the plant operating at its full capacity during the term you were examining?

A. No, sir, I think not. I didn't make any particular inquiry about that, but no plant is in the summer time.

Q. You didn't make any inquiry to find out whether or not these various apparatuses that are in the different plants were really used or not then, I understand. No, sir, I did not, at that time. Of course they had to be used when the plant was operated to the full capacity.

Mr. Page: I think that is all.

Cross-examination by Mr. **Burr**:

Q. On page 1581 of the record there seems to be an uncertainty in your answer. The question is, referring to the 111th Street station, "Do you know as a fact that this plant is not used as an operat-" ing plant by the Consolidated Gas Company? A. Yes, sir, it is " used as an operating plant.

"By Mr. **Mathewson**:

"Q. You mean as a manufacturing plant? A. I mean as a man-" ufacturing plant, yes, sir.

1615 "By Mr. **Page**:

"Q. But it could be operated if necessary? A. Yes, sir, at any "time." Now what is the fact? Is that an operating plant or is it not an operating plant?

A. It is not.

Q. And further on you testified that in your opinion it has not been used as an operating plant for several years.

Mr. **Mathewson**: What plant is that?

Mr. **Burr**: 111*st* Street.

Mr. **Mathewson**: Do you and the witness, each know what you mean by operating.

Mr. **Burr**: I will ask him.

Q. When I asked you if it is an operating plant at 111th Street, what did you understand by that question?

A. That you mean that gas is manufactured there.

Q. That is exactly what I meant. And I understand you to say it is not used for the manufacture of gas.

A. No, sir, it is not.

Q. And therefore it is not used as a manufacturing plant?

A. No, sir.

By Mr. **Mathewson**:

Q. But it is in operation as a distributing plant?

A. As a distributing plant, yes, sir.

Mr. **Burr**: I am not asking about that.

By Mr. **Burr**:

Q. It is not used as a plant for the manufacture of gas and has not been for several years, according to your testimony?

A. No, sir.

Q. What other one of the plants you examined is not being used now for the manufacture of gas?

1616 A. I don't recall any except the holder stations and that portion of 18th Street that is still in existence.

Q. Well now, that plant at 18th Street is not being operated?

A. No, sir, except as a holder station; not as a manufacturing station.

Q. It is not operated as a plant for the manufacture of gas?

A. No, sir.

Q. Do you know how long it has been out of such use as an operating plant or manufacturing plant?

A. The 18th Street?

Q. Yes, sir.

A. I don't remember exactly, but I think it is somewhere since 1902 or 1903.

Q. You have had a general supervision of the plants and holders of the Consolidated Gas Company for same years, haven't you?

A. Never have.

Q. Haven't you inspected them from time to time heretofore?

A. No, sir.

Q. Before you were called as a witness here?

A. No, sir, I built a great many holders for them.

Q. Have you never been called upon to inspect their plant to find out what repairs were necessary, or new construction work was necessary?

A. Oh, yes.

Q. You have?

A. Yes.

Q. How often?

A. I can't recall the number of times. Quite frequently in the years past.

Q. Frequently within the past five years?

A. Very seldom within the past five years, for the reason that during that time most of the plants designed for alteration, were designed by the gas company itself.

Q. Without competition?

A. Oh, no, always with competition. We never had a job from the Consolidated Gas Company without competition.

Q. I understood you to say they were designed by the gas company themselves——

A. That is, upon the alterations, upon which the various bidders submitted their various propositions.

1617 Q. And hadn't you before you made up this schedule, a list of all the plants of the Consolidated Gas Company in your possession?

A. No, sir.

Q. Didn't Bartlett, Haywood & Company have such a list?

A. Oh, no. It would be impossible for them to have it.

Q. When did you first begin to make that list up, seven weeks ago?

A. Yes, sir.

Q. And was that made up by you from a personal inspection of each particular apparatus?

A. Yes, sir; that is, by my men under my supervision.

Q. Was it the man who made the mistake in the valuation for you which necessitated the corrections which you have made here?

A. Oh, that was only the clerk in transferring the figure, in leaving off a decimal point.

Q. It was more than that.

A. Well, all the mistakes are of that kind.

Q. You recall that in some of the addenda to these lists of the apparatus of various plants, you called attention to the fact that you made a mistake in placing the valuation on some of the parts, don't you recall that?

A. It was not a mistake, as far as the addenda was concerned; it was simply an addition which I found necessary upon my personal inspection after the lists had been completed.

Q. You had to increase the valuations because you learned that certain parts of the apparatus were recently purchased, or for some other reason, isn't that so?

A. No, for the reason that I found conditions to exist that I had not observed in my first examination. I went to each of the works repeatedly.

Q. Who called your attention to the fact that you had not observed that on your examination?

A. I found that by going over the works repeatedly myself. I had to change my lists continuously from day to day in making my examinations. When I was not quite sure I sent my man, 1618 and when I did not get an intelligent reply from him I went myself.

Q. No one called your attention to it then?

A. My own men, yes, sir.

Q. Who gave you the dates of the construction of these various apparatus and plants?

A. The various superintendents at the works, as near as they could recollect, of course.

Q. I think you omitted, Mr. Mayer, to give the value of the building in detail at the 14th Street plant?

A. 14th Street?

Q. Yes.

A. I do not remember whether I did or not.

Q. No, you did not.

A. Do you want it?

Q. If you please?

A. 14th Street plant?

Q. Yes.

A. Office building, $6,752 without depreciation, $6,077 with.
Pay room, $2,762 without, $2,486 with.
Building over alley, $622 without, $560 with.
Storeroom, $5,183 without, $4,665 with.
Boiler room, $5,630 without, $5,067 with.
Stack, $1,350 without, $1,215 with.

Q. Do you know when that stack was built?

A. No, sir, I do not.

Q. Why did you allow any depreciation for it?

A. For present condition and general appearance.

Q. What was its present condition and general appearance?

A. Such as would make me think 10 per cent. depreciation should be allowed on my valuation.

Q. Does it appear as if it had been built for 20 years?

A. It is very hard to remember all those details now. If I was on the ground and had another look at it I could better answer that question.

Q. Did you make any memorandum at the time you inspected the plant?

A. Yes.

Q. Any memorandum which would inform you now if you had that data?

A. No, the matter of depreciation in a brick chimney is
1619 simply the impression it makes on a man competent to judge,
and that is all I can say now. That is what I thought at the time.

Q. What did you say the value of that was?

A. $1,350 without, $1,215 with.

Q. By what process did you arrive at that valuation?

A. There was 56 cubic yards of excavation, 17,000 bricks, 36 piles, 500 feet of capping and planking.

Q. I understood you to say that you were not an expert nor did you pretend to be an expert upon anything else but iron. You are not an expert on brickwork, are you?

A. No, I didn't say that. I have designed and built a great many buildings.

Q. You might continue and give valuations.

A. Engine room, $4,400 without, $3,960 with.

Exhauster house, $4,315 without, $3,884 with.

Machine shop, $8,342 without, $7,508 with.

Smith shop, $8,843 without; $7,959 with.

Condenser house, $18,686 without; $16,818 with.

Q. Do you know when that was built?

A. About 1870.

Q. Do you know the year the machine shop was built?

A. The machine shop—1870.

Q. The exhauster house?

A. 1870.

Shed, $[illegible],090 without; $3,070 with.

Large purifier house, $50,160 without; $45,144 with.

Small purifier house, $15,839 without; $14,256 with.

Oxide house, $10,671 without; $9,604 with.

Meter house, $10,693; no depreciation.

Center seal house, $809 without; $729 with.

Center seal house No. 2, same value.

Boiler house, $2,305 without; $2,075 with.

Valve house, $1,159 without; $1,043 with.

Brick walls around holder yard, $21,526; no depreciation.

1620 Retort house, $200,980 without; $170,833 with.

Q. What year was the retort house built?

A. 1853.

Bench foundations, $36,360; no depreciation.

Scrubber house, $2,128 without; $1,915 with.

Brick walls on Avenues C and D, $423; no depreciation.

Brick walls on 14th and 15th Streets, $6,611 without; $5,950 with.

Shed, $4,414 without; $3,972 with.

Q. Is that a coal shed?

A. That is a shed 75 feet 6 inches by 21 feet 6 inches by 17 feet, the first shed.

The next shed, $4,414 without depreciation; $3,972 with.

Coke passage, $24,343 without; $21,910 with.

Gas engine house, $1,658 without; $1,625 with.

Coal hopper building, $7,094 without; $6,952 with.

Coal shed, $167,729 without; $164,375 with.

Yard between office and retort house, $4,707; no depreciation.

Rigger house at end of coal shaft, $1,281 without; $1,163 with.

Small office, $100; no depreciation.

Coal and coke storage, $4,264; no depreciation.

Fencing and timber retaining fences around coke and coal storage, $10,305; no depreciation.

Boiler and engine house, $1,739; no depreciation.

Boiler house and well, $1,278 without, and $1,253 with.

Boiler house, $1,017 without, and $997 with.

Valve house, $169; no depreciation.

Exhauster house, $19,494; no depreciation.

Boiler house, $3,384; no depreciation.

Q. When was that built; do you know?

A. No, sir, I do not.

Q. The exhauster house—can you tell me when that was built?

A. No, sir, I cannot. There is a new boiler house in course of construction as noted in the addenda. The value of that building in its present condition is $6,000. 1621

Tar and ammonia tanks foundations, $1,620; no depreciation.

Coke office, $290 without depreciation; $261 with.

Boiler house, $3,800 without; $3,420 with.

Q. Can you tell when that was built?

A. 1865.

Clay mill and storage, $1,184 without; $1,066 with.

Storage shed, $1,475 without; $1,328 with.

Storage shed, $813 without; $732 with.

Stable, $8,143 without; $7,329 with.

Storage shed, $2,140 without; $1,926 with.

Carriage room, shed No. 1, $835 without; $752 with.

Pump house, $238 without; $215 with.

Storage shed, $3,279 without; $3,115 with.

Storage shed and tank——

Q. Is that the same tank regarding which you testified before?

A. No, sir; $2,784 without; $2,645 with.

Storage shed, $1,320 without; $1,254 with.

Fences on east side of Avenue D and between 14th and 15th Streets, also on 14th and 15th Streets; also on 17th and 18th Streets and between 15th and 16th, as well as westerly side of Avenue D between 14th and 15th Streets, and Avenue C between 14th and 15th Streets. Total $7,585 without; $7,206 with.

Holder yard, $904 without; $723 with.

Boiler house, $1,831 without; $1,648 with.

Weigh office, $1,367 without; $1,230 with.

One-story brick building, $149 without; $134 with.

Valve house, $168 without; $151 with.

Boiler house, $710 without; $639 with.

Foundation for tower scrubbers, $7,854; no depreciation. That is all.

1622 Q. Now in arriving at the valuation which you have given with regard to these buildings did you use the same formula as you did with regard to the other buildings in the other plants?

A. I did.

Q. Adopting the Kings County building as a model or standard?

A. Not as a model or standard but as a normal condition, to which in each instance where the actual condition differed from a normal one, the difference was added.

Q. You did not mean to be understood as saying that all the plants which you have examined are in perfect condition, do you?

A. No, where they were not I have noted their depreciation.

Q. In figuring up the price of the brick walls in this plant, by what process did you arrive at their valuation?

A. I gave that several times in my testimony, by figuring the excavation and the brick, and stone work where there was such in the walls, separate.

Q. For instance, in this plant, what valuation or price did you fix on a thousand brick or brick per thousand?

A. $25 per thousand laid.

Q. And did you adopt the same figure regarding the laying of brick at all the other plants, where brick walls were concerned?

A. I did.

Q. At the present price of brick per thousand?

A. I gave that once before how that was made up in detail. Do you wish to hear it again?

Q. Yes, I would like to hear it again.

A. The price of brick obtained varies from $8 to $12. I took the average price of $10. For labor: Bricklayers, 800 bricks per day, $7; helper, $4; Portland cement, $2.25; sand and water, $0.80; foreman, at the rate of $7 per day, $0.50; timekeepers, $0.20; hod hoisting, $0.50; scaffolding, $0.16. Making a total of $25.41, for which I applied $25.

Q. Did you observe whether there was any vacant land surrounding this plant at 14th Street, belonging to the Consolidated Gas Company?

1623 A. Vacant land? There was I think on the north side of 16th Street, where there was room for another coal yard, to which I have already testified as being supplied with foundations for a coal trestle for coal handling machinery.

By Mr. MATHESON:

Q. Which is now used as a *cold* storage yard, is it not?

A. Now used as a *cold* storage yard.

By Mr. BURR:

Q. What is the size of that yard, do you know?

A. No, sir, I could not tell you.

Q. Is there not room for an extension of the plant at 14th Street?

A. No, sir.

Q. At what plants is there still room for an extension?

A. At none.

Q. Have you made a diagram showing the location of these buildings at each of the various plants?

A. No, sir, I have not.

Q. Then how are you able to swear that there is no room for an extension of the plant at any one of those locations?

A. From my general knowledge as a gas engineer all that it is necessary for me to do is to go through a plant and I could see at once whether there is room for an extension or not.

Q. Do you wish to be understood as saying that there is no vacant ground attached to any of these plants?

A. I was not impressed with the fact that there was sufficient room at any place to make a notable extension.

Q. A notable extension?

A. Yes, sir.

Q. What do you call a notable extension? The erection of an additional plant?

A. No, but an increase of from 30 to 50 per cent. of the present capacity.

Q. 25 per cent. you would not call a notable extension?

A. No, not in large plants.

1624 Q. So that we may say that there is room for an extension of say 25 per cent. on each of those plants?

A. No, you cannot say that at all. On the contrary, I do not think there is any room for any extension; that is what I said before.

Q. You said you did not think there was room for any notable extension.

A. Yes, that includes the first 25 per cent.

Q. Would it be a difficult job to map out or plot out on this Complainant's Exhibit Number 48 the location of each of the buildings at the various plants that you have testified regarding?

A. Not at all; it would not be difficult, no sir.

Q. I would like to have you do that.

Mr. Mathewson: No, I shall not ask this witness, who is not called for any such purpose, to do that, and while it may not be a difficult job, it would be a job of exceeding length; it would require surveys and everything else. I do not think you appreciate what it would mean, Mr. Burr.

Mr. Burr: Would you allow us to do that?

Mr. Mathewson: That is another proposition. I am not on the witness stand.

Q. Then you decline to do so by advice of counsel?

(No answer.)

Mr. Mathewson: I am not his counsel.

Q. Could you substitute nine retort benches for six retort benches in any cases?

A. No, sir, I could not.

Q. Could you, with the existing land and buildings in the borough of Manhattan, increase the capacity of a coal gas works, by substituting nine benches instead of six, as now?

A. I think it could be extended, at a comparatively tremendous cost.

1625 Q. Will you explain a little further what that comparatively tremendous cost would be? What you mean by that?

A. The buildings would have to be changed to a certain extent, in order to accommodate benches of nine, with full depth generator furnaces and charging and drawing machines, which would cost very much more if the plant was built outright new in a different location.

Q. Then, do you consider that the locations occupied by these plants are not favorable locations?

A. No, not at all. If I had to build that plant over again new, of course, as I said, I would construct it differently, for the full capacity that it is now. For that particular district where that plant was originally intended to supply gas, the location was very favorable.

Q. Would you say, that taking all these plants together as a whole, they are up to date construction?

A. I have said the other day that if I was to construct them new for full capacity, I would construct upon different lines than those laid out, which is due to the fact that they were built in small units at the time and added to from time to time until they finally reached their present capacity, but if built for the whole capacity the basis of construction would be an entirely different one of course.

Q. Would you say that these plants are in the most efficient condition, all of them, including the 111th and 114th Street?

A. I said before there was no manufacturing plant on 111th Street.

Q. I am speaking of it as a distributing station or plant, as you choose to call it. Embracing all the plants here, of the Consolidated Company, would you say that they are in most efficient condition?

A. Manufacturing plants you are talking about?

Q. Yes.

A. All the manufacturing plants are in as perfect condition as they can be under the circumstances under which they were 1626 developed to their present size.

Q. And those circumstances under which they were developed to their present size did not operate to make them up to date construction, did it?

A. Why no, it could not be so, because some of those plants originated away back in the fifties, when the plants as used to-day were not known, and the buildings were arranged for that character of apparatus. In order to change them, as I said before, it would cost tremendously to do it on the present site as compared with a new site.

Q. Is there anything to prevent the company from taking these plants one by one and reconstructing them and bringing them up to date, as far as construction is concerned, and increase the capacity of each one as it is rebuilt?

A. There is no chance for any decided increase in capacity. As I said before, they can be improved with modern apparatus, but it would cost a great deal more to do it on the present site, as compared with a new site.

Q. When you speak of the new site, you are speaking of the site on which you are engaged in erecting the plant at Astoria?

A. No, I was not. I say a new site, any new site.

Q. Any new site?

A. Yes, sir.

Q. What was your estimate of the cost per cubic foot contents of a retort house?

A. Under normal conditions, as in the instance of the Kings County works, 14.05 cents per cubic foot.

Q. Under normal conditions?

A. As existing in Kings County.

Q. Do you claim that those conditions exist here in the Borough of Manhattan?

A. Quite to the contrary; in most instances I found that they varied considerably; in many instances there were excavations in rock and in many others pile foundations were necessary, owing to the locality. That changed the normality of the conditions, 1627 and in that case I figured the abnormality separately and added that to the cost of the retort house as determined by the application of the unit price of 14.05 cents per cubic foot.

Q. Can you say how old the turntables were that you have testified regarding, Mr. Mayer?

A. No, sir, I cannot.

Q. Can you tell me what the life of a Root exhauster is?

A. No, I cannot. I never knew one to wear out outright. Those apparatus have always to be maintained in such condition of repair that they do their work, and therefore the repairs always keep up the depreciation.

Q. What is the life of a boiler?

A. Well, that depends upon the handling of the boiler, the character of the coal and a great many other conditions and circumstances which prevent one from applying a general rule.

Q. Could you say what the life of the turntables are?

A. The life of the turntables?

Q. Yes, or the life of a turntable.

A. What I said before regarding the exhauster applies to the turntable and all other apparatus in a gas works. In order to perform their function each and every day they must be kept in perfect repair continuously.

Q. I understood you to say that in making an estimate of value for some of this work, that you sought figures from contractors, and those who made special articles; is that true?

A. I would not call them contractors; I would call them manufacturers.

Q. The manufacturers?

A. Yes, sir, that is, manufacturers of special articles which nobody else makes.

Q. Did you get more than one set of figures for any one article?

A. I could not very well do that, because the article manufactured by one manufacturer is not manufactured by another one. 1628

Q. You asked the manufacturer of a particular article what he would supply that particular article at?

A. Yes, sir.

Q. That embraced the delivery and setting up of the particular machine?

A. No, that only included the delivery.

Q. And then you added what you thought would be the proper figure for setting up?

A. For the erection, yes, sir; that is, not what I thought to be a proper figure, but what I knew to be the proper figure.

Q. Well, you are merely expressing an opinion here, isn't that all?

A. No, I am expressing my knowledge from past experience.

Q. Now, I will ask you from your past experience and your present knowledge whether you can state accurately the extreme daily capacity of the 14th Street station from your own computation?

A. No, I cannot. I have not figured the sizes of the apparatuses in order to establish the total amount of capacity, but I know that such an amount of gas per day has been produced in those particular stations in each and every one of them many times and in some of them they have not quite come to the maximum and in others they have gone beyond the maximum.

Q. Would you swear in the 14th Street station, for instance, that they had reached the maximum capacity there and they could not produce more?

A. 14th Street you are talking about?

Q. Yes, sir.

A. Yes, sir, as I recollect, at 14th Street they had produced the capacity that I stated the plant to have, within a small fraction.

Q. Well, what I am asking you, Mr. Mayer, is whether you wish to be understood as saying that they could not produce more than the figure you have given? I want to know whether that is really the maximum capacity of that plant, or whether it is not the fact that more gas could be produced there than the maximum that you have given? 1629

A. If you ask me that question, I would have to figure the capacity of each and every apparatus of the plant before I would be able to make a decided answer.

Q. So therefore the capacity which you give to each one of these plants is not the capacity arrived at from your own computation?

A. No, sir, it is the capacity which was given me by the various superintendents.

Mr. Mathewson: It is already on the record and has been testified to.

Mr. **Burr**: It is not on the record that this capacity was not the result of his own computation.

Mr. **Mathewson**: No, but the capacity is already on the record as testified to by Mr. Bradley and he took the same capacity as Mr. Bradley did.

Q. Mr. Mayer, you have stated that the 111th Street coal gas works of 2,500,000 feet daily capacity, or 500,000,000 feet annual capacity, are lying idle, and I want to ask you, could not those works be completed and more than doubled in capacity, at a reasonable expense?

Mr. **Mathewson**: He has not testified to any such thing as that, Mr. Burr; I am quite sure he has not.

A. I have already stated in connection with my testimony for that plant that the benches in this plant could not be used except in connection with some other station, where there were exhausters, condensers and purifiers.

1630 Q. Isn't there room to put exhausters, condensers and purifiers?

A. Nothing like for the capacity of the benches. I presume that a portion of that ground was taken from the other side which has now been converted into a holder storage yard.

Q. When you say the other side, to what do you refer?

A. The other side of First Avenue.

Q. Insn't there room on this block bounded by 110th Street, 111th Street, First Avenue and Pleasant Avenue, for the construction of the additional buildings which would be necessary to increase or practically double the capacity of that plant there?

A. Nothing like it, because you would have to provide for a coal storage at the same time if you supplied such a large plant as that. It would be altogether too small.

Q. It would be altogether too small?

A. Yes, sir.

Q. What space would be required in your opinion, to enable that plant to be doubled in capacity.

A. There is no plant there now; there is only a retort house there, only a part of a plant.

Q. I mean the buildings which would make it a plant capable of doubling the capacity which you say it has the ability to provide each day now.

A. I beg your pardon, I did not say there was any ability to produce any amount at that works except in connection with some other works where there are exhausters, purifiers and condensers. Upon this station there is only part of a plant, only the generating plant consisting of the retorts and benches.

Q. I asked you what space additional beyond what is here now used by the Consolidated Gas Company would be required to put up those buildings you speak of, the exhausters and condensers.

Mr. **Mathewson**: And provide for coal and coke storage?

The **Witness**: A plant not less in area than the 14th Street works, which is 5,500,000 cubic feet.

1631 Q. Which of the holders are the more recently constructed?

A. This one at 132d Street.

Q. And what is the holder that is next to that?

A. 111th Street, I think, the two at 111th Street.

Q. Did your firm build the one at 132d Street?

A. Yes, sir.

Q. And also build the two at 111th Street?

A. Yes, sir.

Q. And what other holders did your firm build?

A. Here in New York?

Q. Yes, in Manhattan.

A. Well, we built holders for all the companies more or less, and particularly all the large holders, every one of them without exception. We built formerly the holder in brick tank at 63d street. We built another one at 65th Street, I think of 4,000,000 and 3,000,000 cubic feet capacity respectively; and a great many others which I cannot recall just at the present moment as to location.

Q. Now, you say you took the rate of wages, shop and field, from your construction work?

A. Construction accounts.

Q. To what construction account do you refer?

A. To the construction account of the firm of Bartlett, Hayward & Company.

Q. How recently?

A. To date.

Q. Were these construction accounts made in connection with the construction of any particular plant?

A. Every one of them; when a particular contract is finished we know to the thousandth part of the cent; we know every mill that has entered into that construction.

Q. You say that in connection with the boilers of these various plants regarding which you have testified and given a value, you cannot say when any of them were first used. You don't know the life of the boiler, in other words?

A. No, I did not make any inquiries regarding that. I
1632 found that they were all in perfect condition and operated
to the full pressure allowed them, and as this was not a low
pressure in any instance, there was no reason for making any further inquiries. If any defects are developed, they are at once made good.

Q. Then you can fix depreciation without knowing when they were originally in use?

A. The same as I can with an engine or any other apparatus, the general appearance of that apparatus indicates to me the approximate depreciation I should allow as a practical engineer.

Q. Are you engaged now in any construction work in Astoria?

A. I am not, no, sir.

Q. Have you finished all that?

A. My firm is. I have severed my connections with the firm and therefore I answer your question in that way.

Q. And you left the firm in July last?

A. I left the firm actually in December last, but practically on May 1st.

Q. When did you start in to appraise these plants?

A. Oh, I don't know, about seven or eight weeks ago, I don't recall the exact date. I have the exact date but could not tell it just offhand. I think it was around about the 8th or 10th of July. I think it was the 8th of July if I remember rightly.

Mr. Burr: That is all I want to ask.

By Mr. Page:

Q. I intended to get, if Mr. Mayer was willing to do so, a statement bringing together the different coefficients at which he estimated the prices and cost?

A. Do you mean a copy of this paper?

Q. I don't know what that is.

A. Those are my coefficients of cost or my factors in making up the coefficients.

Q. That is what I meant, one statement.

1633 Mr. Mathewson: Do you mean as to each one of these various apparatus he has testified to?

Mr. Page: Yes, his prices on which the coefficients of cost were based.

Mr. Kirby: And materials entering into the construction.

Mr. Mathewson: Hasn't he stated them already?

Mr. Page: He has stated some of them. I mean how he arrived at that.

The Witness: I have given you all the material cost for the apparatus and given you the holders and condensers.

Q. Have you given what it cost for cast iron?

A. I think I have given you the cost of cast iron and wrought iron condensers and purifiers in detail, I think in my testimony already.

Q. What is there that you have not given?

A. That is all that I recollect at the present moment. All the others I have not given, but they do not vary much in character.

Q. Have you used the same price for cast iron, for instance, in all apparatus?

A. Yes, sir, I have stated that my price for cast iron is based on the material, to which must be added the melting of the iron in the cupola, and to that is applied my unit for cast iron. It is the same thing in each and every instance, because it only represents the iron in a melted condition ready to leave the cupola.

Q. Have you given the wrought iron?

A. I have given you the price to-day. The prices are the prices quoted by the mills.

Q. That applies to all kinds of apparatus, doesn't it?

A. To all kinds of apparatus, yes, sir.

Q. And steel the same way?

A. Steel the same way, yes, sir.

Q. Whether it is steel plate or whether it is steel in bars?

1634 A. I have given you the prices for the bars and for the plates and for the mill plates and for every kind of plate separately.

Mr. PAGE: All right, I will withdraw the question if you think it is sufficiently on the record.

Redirect examination by Mr. MATHEWSON:

Q. Mr. Mayer, has your firm of Bartlett, Heywood & Company, and have you, as their chief engineer, constructed gas plants complete, including buildings, apparatus and yard connections and holders?
A. Yes, sir, quite a number of them.
Q. So that you are familiar with the construction and the cost generally of all these different parts of a plant?
A. Generally and in detail.
Q. Referring to your valuation of buildings, you stated you took as a standard the cost you had derived of one building of the same character, say a retort house, and you applied that to another retort house and computed the value of the second retort house upon a proportion between cubic contents of the two?
A. That is right, sir.

Mr. PAGE: I prefer that the witness should state it rather than have counsel testify.
Mr. MATHEWSON: He has already stated that, and I am only reciting it as a preliminary to a question.
Mr. PAGE: All right, I was just calling attention to the fact. I do not press the objection.

Q. If you have one building 50 feet by 50 feet, a retort house, and compare that with a building 100 feet by 50 feet, is it not a rule that the larger building——

Mr. PAGE: Had you not better say what is the rule?
Mr. MATHEWSON: No, I do not think so.

1635 Q. (Continuing:) should have partitions or buttresses of trusses or thicker walls at the base or something else in order to preserve the same structural strength as the smaller building?
A. Yes, if you remove the partition and double the building, it becomes necessary to obtain the requisite resistance, which a partition wall would have had had it been permitted to remain in place, by some other means; and those means are either the increase in the thickness of the walls, or pilasters or increase in the thickness of pilasters or the addition of buttresses in the middle of the wall.
Q. Did I understand you to say that in the buildings you included the foundations of apparatus also?
A. In my unit prices of buildings?
Q. Yes.
A. The foundations of all apparatus in that particular building are included.
Q. I want to ask you whether this method of computing the value of one building by taking the standard derived from the cost of a similar building and comparing their cubic contents is one which is employed or recognized by engineers outside of yourself?

Mr. PAGE: I object to it as immaterial and irrelevant.

The **Master**: I will allow it.
Mr. **Page**: Exception.

A. I have very often in discussing prices of buildings with other engineers and with builders and contractors, heard the same rule applied. It is a quick method of arriving at practically a correct figure for an aggregate number of buildings.

Q. Have you ever compared in your experience the results of estimates made in this manner with the actual cost of the structures as they turned out?

1636 A. In all my construction records, when the same are finished, I convert the actual cost of the buildings upon a basis of this kind, that is, I establish the actual cost upon a basis per cubic foot of contents.

Q. According to your experience how do those compare with the actual cost, the estimate made in this manner?

A. Absolutely correct, for present conditions.

Q. Why didn't you, Mr. Mayer, in this case, proceed to take the measurements and compute the cubic feet in buildings and foundations and so on, instead of pursuing the method which you have in estimating the value of these buildings?

A. To do that, it would have really meant to make a detailed estimate based upon plans and specifications, therefore such a methed could not be applied in this instance for the reason that I should have had to make detailed plans and specifications before I could make an estimate of that kind. To do that it would have taken not less than nine months for all the buildings in the various plants which I have examined; besides which I was satisfied that the method which I applied was just as correct for the aggregate number of buildings as it would have been by making detailed drawings and plans and specifications of each building.

Q. Where you or your firm is called upon to make a bid for the construction of buildings, are not the specifications and dimensions all presented to you so that you have the material before you upon which to compute the cubic feet of brick, and so forth, where bids are asked?

A. For bids in connection with gas works we generally design the buildings ourselves and submit them to the various builders and obtain the prices from the various builders ourselves, therefore, I have the intimate knowledge that I do have as to what the buildings would cost if constructed by other contractors.

1637 Q. Referring now to apparatus. Is you firm a constructor of gas apparatus?

A. We, are, sir.

Q. You are not contractors alone, but manufacturers, as well?

A. Yes, sir.

Q. What proportion of the apparatus of the gas plants as they are here are manufactured by your firm, or can be?

Mr. **Burr**: When you say "here," you mean——
Mr. **Mathewson**: New York, of course, Manhattan.

A. All with the exception of a few apparatuses of special construction, such as engines, exhausters, blowers, and boilers; and in the instance of a water gas plant, the generating apparatuses, which we always purchase from the United Gas Improvement Company, considering them the best in the country.

Q. What per cent. of the apparatus in a plant of this kind would your firm be able to manufacture?

A. I should say 90 per cent. and over. I believe I could say 95 per cent. and over. Perhaps in the instance of a water gas plant, the percentage would reduce to 85 per cent.

Q. In making your estimates of the cost of apparatus to which you have testified where that apparatus is manufactured by Bartlett, Hayward & Co. did you proceed upon the same basis as you would if you were submitting a bid?

A. Absolutely the same basis.

Q. Do you proceed in that way upon the basis of weight?

A. Yes, sir.

Q. And in valuing all these pieces of apparatus to which you have testified, have you gone into the same detail in estimating the value, that is, the cost of the raw material, the shop labor, the labor in setting up, and other things that you have testified to in respect
1638 to one or two items regarding which you were asked?

A. I have and I could not do otherwise. I could not go to a work and value approximately a piece of apparatus to save my life, I am so used in making detailed estimates.

Q. Have you seen yourself all the apparatus you have valued?

A. Every one of them.

Q. Now, in reference to this estimate by weight, is it possible where you estimate apparatus or machinery for you to determine the weight?

A. Yes, sir.

Q. With what exactness?

A. With absolute exactness.

Q. In other words, the weight of cast-iron or steel is substantially uniform, isn't it, for the same volume?

A. Per unit of surface or volume, yes.

Q. So that would you consider the weight of the apparatus to which you have testified as an estimate or as an exact thing?

A. As an exact thing.

Q. And you then apply this cost of cents per pound figured out in the details to which you have testified?

A. Yes, sir, and it makes it equally as exact as the weights.

Q. How do you regard the 15 per cent. profit which you have added for contractors? Is that an excessive or an ordinary profit in your experience?

A. I have only added 15 per cent. profit, you say?

Q. 15 per cent. for the original contractors.

A. For the profits?

Q. Yes.

A. Well I consider that as an extremely low profit, but it is all that can be obtained under the present conditions of competition, and in my opinion it should not be less than 20 per cent. in order to get out whole out of the contract.

Q. Have you and your firm bought during the past year considerable apparatus of a special character which is not manufactured by you; that is to say, boilers and so on, to which you have referred?

1639 A. Well not a great deal because that is such a small percentage of the total plant.

Q. But you have had experience in buying that, have you, so that you know the value generally?

A. Oh, a great deal of it, particularly in the instance of the exhausters and blowers. Not so much in the instance of the boilers because that is an article anybody can buy in the open market, in any locality.

Q. And in making up your estimate of that part of the apparatus did you apply to the manufacturers to give their figures, to confirm your own impressions, or otherwise?

A. I did; and as I said the other day they were low figures because they have to give us lower figures than they do the gas companies.

Q. I want to ask you whether the 10 per cent. which you have added to these costs and which you stated covered the engineering expenses of the company in installing the plant and the sewering of the plant and other items, is recognized by engineers in general as an additional charge to make up the total cost of the plant?

A. Yes, sir.

Q. Did you say whether you made a personal investigation of your own records to find out whether that was a proper figure?

A. I did.

Q. And what was the result?

A. It was nearer 15 per cent. than 10 per cent. That includes all the charges I have enumerated in the first or second day of my testimony; of the items, I should say.

Q. And to holders you added only 5 per cent.?

A. Only 5 per cent.

Q. For that item?

A. Yes, sir.

Q. Now, as a matter of fact in your experience, is a plant which has been built up for the last sixty or eighty years to supply gas, being increased in capacity from time to time as the requirements of the consumers increase, in any instance exactly the same 1640 as a new plant which you would install for the full capacity if you were to do it over again to-day?

A. No, sir. If I should build a plant for the full capacity it would be built on different lines.

Q. But where a plant is built up in this way, is it ever possible to get it exactly on the lines as you would produce it to-day new?

A. Not at all.

Q. Did you observe the plants in operation as you went through them?

A. I did.

Q. You observed whether they were operating efficiently and simply.

A. Yes, sir.

Q. And wherever you found anything not in use, have you so noted it and testified?

A. I believe in every instance, as near as I could.

Q. Would it be economy, for instance, having benches of 6's operating properly, to tear those benches out and put in 9's because the consumption had increased?

A. No, it would not in these plants, for the reason that the benches of 9's would require entirely different areas than the benches of 6's, and that would in all probability entail a loss in capacity instead of an increase for the reason that the benches of 9's would have to be constructed upon the same foundations as the benches of 6's and these foundations may be entirely inadequate to support the same capacity in benches of 9's.

Q. You have spoken of benches with regenerative furnaces and spoken of the regenerative furnaces as being somewhat economical. What is the comparison in cost between regenerative furnaces and the ordinary furnace?

A. I figured these, as near as I can remember now, for benches of 6's of ordinary construction, at $2,210, I think I gave the price or the value. The same bench with the full depth regenerator furnace would cost to-day $5,600.

Q. In other words, more than twice as much?

A. More than twice as much.

1641 Q. You have been asked in reference to steel tanks and brick tanks. How long has steel been used in the construction of gas tanks for large holders?

A. I should say about 18 years; 18 to 20 years.

Q. So that prior to 1884, tanks had not been constructed, had they, of steel?

A. There was no steel made at that time for such apparatus.

Q. Have you computed, or added together, your figures so as to show the cost of reproduction of these plants of the Consolidated Gas Company as they now exist, reproduced new, without allowing for depreciation?

A. Yes.

Q. Just give me the grand totals.

A. For the plant, $12,537,262; for the holder stations, $3,600,215, making a total of $16,137,477.

Q. That is exclusive of the 18th Street plant, which has been taken by the City?

A. Yes, sir, exclusive of that 18th Street plant.

Q. If each plant were to be reproduced, I suppose it would be necessary to reproduce them new? You could not reproduce depreciated plants?

A. Not very well.

Q. And wherever you observed any deterioration in this apparatus in going over it, or any machinery, did you in every case note it, and have you included it in your figures?

A. Wherever there was any I have included it.

Q. You were questioned as to whether the plants of the Consolidated Gas Company could not now run continuously at their maximum daily capacity. Do you mean that they could run every day in the year at the maximum daily capacity?

A. Every day in the year. But what I mean by that is in gas works construction we always base a yearly production on a period of two hundred days. All my references to capacities are based on that factor, that is, 200 days per year instead of 365 days.

1642 Q. You would have to have time down for repairs, wouldn't you, in the plants?

A. Yes, sir, and that is taking up the balance of the time.

Q. And during the summer season of course there is no requirement for the maximum output of the plant?

A. No, sir, there is not.

Q. And then the maximum annual output of these plants would be obtained in your judgment, would it not, by multiplying the maximum daily output by 200?

A. Yes, sir.

Q. Are you able to state generally whether the cost of buildings is greater to-day than it was in 1884, or less?

A. As compared with 1884?

Q. Yes.

A. The cost to-day is considerably more than in 1884.

Q. How about apparatus, speaking generally, if you can state?

A. A great many apparatuses cost less to-day. The reason for that is that in some of them or many of them the patent has expired and no royalties are to be paid to-day, and in other apparatuses the competition at 1884 and previous to 1884 was such that enormously high prices could be asked at that time which is not the case now. I know that ordinary bench castings have been sold for a price at least 60 per cent. higher than you are able to obtain for them, at the present time, which was only due to the fact that competition was exceedingly small.

Q. Is your firm of Bartlett, Hayward & Company a large producer of gas apparatus, or small?

A. We employ at present in the neighborhood of 2,000 men and have been doing that almost continuously for several years.

Q. Do you know how they compare with other manufacturers as to amount of manufacture; as to output?

A. Bartlett, Hayward & Company manufactures very much more than any other manufacturer of gas works in this country.

1643 Q. How about the construction of gas works and apparatus. How do they stand as to amount?

A. The same condition applies there.

Q. They are the largest constructors in this country?

A. Yes, sir.

Q. Referring to the 14th Street plant, you spoke of $48,000 for purifiers in the large house, or about that. Did that include the center seals?

A. Yes, sir.

Q. Are you sure about that?

A. Yes, sir, but not the connections between the center seals and the purifiers. Oh, I beg your pardon, what did you say, 14th Street? It is possible I may have given the center seals extra.

Q. Well, I would like to know?

A. Yes, sir, center seals are included.

Q. In reference to the 21st Street plant, which is now a water gas plant, you stated, I think, that the buildings were now crowded with water gas apparatus?

A. Yes, sir.

Q. And you were asked if whether buildings were to be constructed now they could not be constructed for less. If you were asked to lay out and plan a water gas works of same capacity as 21st Street to-day and had the room, would you confine yourself to the buildings at 21st Street, or would you build larger ones?

A. I would build larger ones.

Q. With more space?

A. More space, yes, sir.

Q. And more expensive buildings?

A. And more expensive buildings, yes, sir.

Q. Do you know that the capacity of the 21st Street works has been increased since it became a water gas works much beyond what it was as a coal gas works?

A. Yes, sir.

Q. When you speak of $123 per thousand as the value of the water gas plant, do you include any holders in that?

A. I do not.

Q. What do you include?

A. Only the plant itself, without any holders.

1644 Q. Generating plant?

A. Generating and purifying plant, condensing plant, the entire plant except holders.

Q. Does it include the general connections?

A. Yes, sir, everything except the holders.

Q. The term operating plant was used in asking you some questions in reference to these various plants of the Consolidated? Are not all of them operating either as manufacturing plants or as distributing stations?

A. Yes, sir.

Q. When you use the term "operating" what do you mean?

A. Manufacturing. I do not recall now how often I used that and just in connection with what statement, but I do believe under the term of the operating plant I should mean a manufacturing plant, that is a gas producing plant.

Q. You were questioned as to a building at 18th Street enclosing some holders there. Is that form of construction, enclosing holders in a building, in use anywhere to-day?

A. No, I believe it has been universally abandoned, even in severer climates.

Q. Was it formerly a construction that was recognized by engineers?

A. Well, yes, it was used many times. I have constructed some of those buildings myself.

Q. Does not that reduce the cost of taking care of apparatus inside?

A. Yes, sir.

Q. Saving the expense of cleaning snow off the holders and doing various other things?

A. It was not so much the expense entailed in cleaning the holders from snow, but at that time it was considered dangerous or almost an absolute impossibility to clean holders in severe climates as Canada or Chicago from snow during heavy storms. By better and improved construction of the holder recently we have applied complete stairways extending from the ground level to the top, so any portion
of any holder, no matter how large, can be conveniently
1645 reached by the men that go on top to shovel off snow.

Q. Is there any wall around outside of this building at 18th Street, or does the building form the wall between the premises and the street?

A. Well, just the side walls of the building of course from the enclosure for the holders.

Q. So that if the buildings were not there at all and were roofed would there not be any necessity for a surrounding wall to surround the enclosure?

A. I don't understand you.

Q. If there were no building there roofed in, would there not be required a wall to surround the premises, that wall now being part of the building wall?

A. That wall would be very much lighter and, of course, very much lower.

Q. Oh, of course, but there would be some requirements for a well or some method of enclosing the premises?

A. Yes.

Q. Is it feasible or desirable in your judgment as an engineering proposition to have a single unit or plant to produce 41,500,000 cubic feet of gas daily, or is it necessary to have units in that case?

A. You mean as an entire plant?

Q. Yes.

A. Including purification, condensation and everything that makes up a plant?

Q. Yes.

Mr. Page: A water gas plant.

Mr. Mathewson: We are talking about gas in general. We will come to that later.

Mr. Page: My question was directed to the water gas.

Mr. Mathewson: I am questioning the witness now. Mine was not.

A. No, I should consider that not only as improper, but as a very
expensive method of building a large gas works.
1646 Q. What, in your judgment, would be a fair limit of the
capacity of a single unit daily?

A. The same limit as applied in the new works for the Astoria Light, Heat and Power Company; that is 20,000,000 feet per day, for coal gas.

Q. And after you pass that limit, isn't each unit in effect a new plant?

A. Yes, sir.

Q. Would there be in your judgment any special economy in the production of gas after you had reached an output of say 600,000,000 or 700,000,000 feet a year for any increase beyond that?

A. No, in my opinion there would be absolutely none, for the reason that when you arrange a plant of say 20,000,000 feet capacity so that your manual labor and your machine labor are continuously employed during a certain time entirely, in other words, if you get all out of the manual and machine labor that can possibly be obtained that limits the capacity of your plant. Will you excuse me. I just want to correct that. I won't say limits the capacity; I will say determines the limit size of the plant.

Q. Do you remember what the discount was which you allowed upon the construction of a single holder by reason of the contract for three or four $5,000,000 cubic feet holders? Do you remember the percentage, whether it was 1 per cent. or 2 per cent., or what?

A. No, I have not figured that on that basis at all. What we allowed was of course that reduction in the material for the four holders. Of course it is quite an inducement for the mills to make a special price when they get an order for such a large amount of material.

Q. Do you remember whether the reduction was slight or a very large one?

A. I cannot recall just how much that was, but it was very nearly equal to the difference in the cost and the difference in the valuation and that of actual cost, with the exception of the labor item to which I referred before.

1647 Q. In practical construction would you be called upon to build at the same time all the holders that now belong to the Consolidated Gas Company, under any conceivable circumstances?

A. Absolutely impossible. I could not make the schedule to order the iron or street at the same time so as to make an inducement to the mills to reduce the price.

Q. And holders are constructed as additional requirements for them arise?

A. Yes, sir.

Q. Increase of consumption?

A. Yes, sir.

Q. And new distributing stations?

A. Yes, sir.

Q. You have given a total value for the 99th Street plant of nearly a million dollars. Will you state how much of that is presented by you as the value of these hydrogen scrubbers respecting which so much time has been taken?

A. You mean how much of the total?

Q. Yes, as to how much those hydrogen scrubbers stand for?

A. At 99th Street?

Q. Yes.

A. $1,560 without depreciation; $1,485 without the 10 per cent. and 5 per cent.

Q. $1,485?

A. Yes, sir.

Q. Now, in reference to the scrubbers, in the manufacture of coal gas, is it not the fact that scrubbers bear some rather fixed relation to the amount of gas which passes through them or which has to be scrubbed?

A. Yes, sir, that is a fact.

Q. You have said, however, in relation to the water gas, that there must be a minimum provision for the scrubber, but after you get beyond that, isn't it largely a matter of discretion in the operator as to the kind of scrubbers that shall be used? Is there any such fixed relation as there is in connection with coal gas?

A. No, there is not.

Q. I finally ask you whether from your observation of these plants, knowing that they have been built up during the last sixty or eighty years, you consider the plants as efficient and in good condition or otherwise?

1648 A. I believe I have already stated that in my testimony. I think that all of the plants that are operated to-day for the manufacture of gas are as perfect as can be made under the conditions under which they were built and developed.

Recross-examination by Mr. Page:

Q. Would you place the same limit of capacity for a profitable reproduction of gas works, or a water gas works, that you have on a coal gas works of 20,000,000 cubic feet per day?

A. No, I should increase the total capacity per unit of plant very considerably.

Q. You could construct one plant that would produce 41,500,000 cubic feet of water — per day?

A. Very easily, but it would contain a multiplication of units of even smaller generating capacity than I had in my mind when I gave the limit of capacity for a coal gas plant as 20,000,000 for the simple reason that a water gas apparatus for 5,000,000, 10,000,000 or 15,000,000 cubic feet per day, is a self-contained apparatus in itself all the way through; whereas in a coal gas plant, you have to have a certain number of benches, and that changes the conditions entirely, so that a water gas plant could be almost increased to any total capacity by simply adding those additional smaller units one alongside of the other.

Q. So that there is practically no limit to the economical production of any one plant of water gas, no limit of capacity I mean?

A. No, you could keep on adding water gas apparatus and call each one of them a unit of the total plant, providing you were to increase your purification in the same ratio in proportion to the generating apparatus, it would really mean a multiplication of smaller units than in the instance of the coal gas plant.

Q. That is, it requires less purifying capacity to purify water gas than it does coal gas.

A. No.

1649 Q. That is, you can purify more water gas than you could coal gas with the same purifying boxes?

A. No, sir, I said just now when you come to the purifiers, you have to build your purifiers in proportion to any accepted number of units that you might call a plant.

Q. As I understand it, you have taken as a unit or maximum unit which you can use in a coal gas plant, one that produces 20,000,000 cubic feet of coal gas?

A. Yes.

Q. Now, what is your maximum unit of capacity of water gas plant?

A. Well, I should say that you could build a water gas plant of double that capacity and call it a unit, provided, as I said before, that your purifying apparatus and all other apparatus are in proportion to the generating plant.

Q. Then you could very easily construct a coal gas plant of a capacity of 20,000,000 cubic feet per day and a water gas plant of 40,000,000 cubic feet a day, making a total capacity of 60,000,000 cubic feet?

A. Yes.

Q. Now, you spoke as if the maximum of your capacity was 200 days.

A. 200 days, yes, sir.

Q. It is not required merely for the purpose of repairs and renewals that a plant should be shut down for 165 days in the year, is it?

A. No, sir, the 165 days means that it takes care of the wear and tear and necessary repairs besides the variation in gas production between summer time and winter time. If you average the total you will find it is about applicable for two hundred days a year.

Q. Now if you had a condition where the summer demand equalled the capacity of the works, could you run the works right through the summer?

Mr. MATHEWSON: An impossible assumption.

Mr. PAGE: Not at all.

Mr. MATHEWSON: Yes.

1650 A. Could I run it through the Summer?

Q. Yes.

A. You mean to say six months?

Q. Could you run 300 days, we will say?

A. On a full capacity.

Q. To the maximum capacity.

A. It would be impossible; you have to have time for alterations and to replace wear and tear.

Q. How much time is it necessary to repair and replace wear and tear in a plant?

A. Well, I know that under present conditions wheer we figure the 200 days' continuous operation, that the balance of the time is used up to the last minute in making necessary repairs.

Q. Then it has nothing to do with the increase of the demands in the summer, but the 165 days are consumed in repairs; is that right?

A. As I said before, both wear and tear and the decrease in making of gas and the demand for gas; that is all taken care of by that difference in time, being 165 days.

Mr. MATHEWSON: That has all been gone over; it seems to me it is clear enough; but perhaps it is not.

Q. You say that in constructing a gas plant it has been your custom after completing a building of any particular kind, to reduce that to a per cubic foot standard?

A. Yes.

Q. But in the estimate which you have given of the values of the buildings in this particular plant, you have used merely the comparison of the Kings County buildings? That question can be answered yes or no, I think.

A. I have applied them as a standard.

Q. Applied the Kings County buildings alone as a standard?

A. Yes, sir.

1651 Q. Now, in giving the dimensions of the U. G. I. water gas machines as you have, have you given the same dimensions as would appear on their catalogue, where you state that it is 11 feet by 20 feet, we will say.

A. I have obtained these dimensions at the various works where I found the apparatus, and then asked the United Gas Improvement Company for the price of the apparatus.

Q. Have you taken the measurement of the outside of the shell, or did you measure inside of the brickwork?

A. No, I took the measurement outside of the shell in each and every one of the apparatus.

Q. Is that the way they catalogue it?

A. I do not know that they have any catalogue, I never saw any.

Q. You say in making your estimates of units, you have allowed a manufacturers' profit of only 15 per cent.?

A. Yes, sir.

Q. Haven't you also allowed 10 per cent. additional for contingencies?

A. I have, and in the instance of the holders I think it is 15 per cent.

Q. You stated that in your going through these plants you observed that they were operating efficiently. What did you mean by that. That they were making gas?

A. That they were making gas without any apparent difficulty, in the ordinary manner in which it should be produced. I could not see any difficulty in any way, shape or form in any part of the plant.

Q. You did not take into consideration the amount produced of gas, per pound of fuel used, or anything of that sort, that would go into the cost of operation, did you?

A. I did not examine the operating results at all.

Q. What you mean then, when you say you saw them working efficiently, is that they were manufacturing gas, and that gas was being run through the different apparatus?

A. That is it.

Q. Benches of 9, with a generating furnace, is a more
1652 economical and efficient method of producing coal gas, is it
not, than it is by benches of 6 directly fired?

A. Yes.

Q. Then, did you estimate that a bench of sixes by direct fire was depreciated in value by the fact that a more modern and recent apparatus, and a more economical apparatus had come into existence when you made your estimates here?

A. I only ascertained the depreciation upon the present conditions and the appearance of the benches.

Q. That is, you took a bench of sixes produced with a direct fire furnace and compared that with another bench of sixes with a direct fire furnace that was in existence?

A. That was it.

Q. But you made no allowance or depreciation on account of the fact that a more economical or efficient apparatus was in use now?

A. I did not, sir.

Q. How did you get at your value or cost price of a full depth generator furnace at $5,000 per bench?

A. From the estimate which I only recently made, within the last two months.

Q. Is that in the City of New York, or for use in the City of New York?

A. No.

Q. Where was it?

A. Indianapolis.

Q. Can you give me the result of the computation which you made to arrive at the cost price of $5,000 per bench for a full depth generator furnace, at nine to the bench?

A. The price has not been submitted yet.

Q. I want to know the figures, never mind about that particular estimate, I want to know the various figures that would enter into a computation that would show $5,000 as the cost of the bench?

A. I know that that figure is right from my own knowledge and experience in the construction of benches, that is, for a retort 10 feet long. If it was a through retort, 20 feet, the price would be
double. The price of a 20-foot inclined retort is $12,000
1653 at the present time. This would only be $11,000, being a
horizontal retort of the same length, 20 feet.

Q. Then, do I understand that you cannot give the figures that would show that cost, or that you do not wish to.

A. I have stated just now that all my prices would be nearly $13,000 for a bench, 20 feet inclined retort. For a horizontal bench, a new bench would be about $11,000. The price I have given is $5,500, which is one-half.

Q. It is $5,000 as I remember it.

A. These are the regular market prices for the apparatus at the present time.

Q. You do not go out in the market to buy a bench of retorts, did you.

A. Perhaps I should not have said market prices, but prevailing prices for that kind of construction.

By Mr. MATHEWSON:

Q. Does that mean installed?

A. That means erected on foundations not including foundation. I am erecting such retort benches now in the State of Massachusetts, and I have just finished another installation in Massachusetts, at about those prices.

Q. How much more does it cost to make a full depth than half depth?

A. Well, the price for a half depth bench, ten foot long retorts, would probably be in the neighborhood of $3,500—between $3,500 and $4,000.

Q. Now, as I understand it, the only reason that it is impossible to reproduce the holders at one time is the fact that you could not make plans and specifications and get them to the works rapidly enough to secure contemporaneous construction, is *the* right?

A. That is not the reason. I can make plans and specifications in a comparatively short time, but the mills would certainly object to accepting them for all the material required to replace, 1654 all the holders in the City of New York, because it would extend for a period of five or six years, and maybe longer, and they would not give prices in advance for that period of time.

By Mr. BURR:

Q. Would you not say that the more improved a plant is in construction, the better the gas and the lower it cost to manufacture?

A. As to the quality of the gas I should say no. There is no reason why the quality of the gas should not be as good in a plant that was constructed some time ago as compared with construction to-day. As to the cost of production I should say it would be less, when you consider the application of machinery to replace manual labor in connection with improved apparatus.

Re-direct examination by Mr. MATHEWSON:

Q. Referring to the plants of the Consolidated Gas Company, only the 42nd and 14th Street plants are now coal gas, you testified. Can you tell the total capacity of those two plants?

A. 14th Street, 5,000,000 cubic feet; 42d Street, 4,500,000 cubic feet.

Q. That is 9,500,000 cubic feet together?

A. 9,500,000 cubic feet total.

Q. The total capacity of the plants to which you have testified, of this Consolidated Gas Company, is something over fifty millions, is it not?

A. Excuse me one moment. I will add it up. Fifty-one million feet exactly.

Q. So that the water gas plants would represent out of that fifty-one million how much, taking the 9,500,000 cubic feet out?

A. Well there is nearly four-fifths approximately.

Q. In feet, how much.

A. 41,500,000 cubic feet.

Q. Did you not testify that as far as those gas plants were
1655 concerned that they had the most improved apparatus and
up-to-date installation?

A. I did.

Q. Do you know of any way in which they could be improved, that apparatus?

A. I do not at the present time.

Q. Referring now to the possibility in a single plant of producing 40,000,000 cubic feet of water gas per day, so long as the water gas units are distinct, would there be any particular advantage in aggregating all that 40,000,000 cubic feet together in one plant?

A. None whatever.

Q. Would it not have the disadvantage that in case of explosion or something of that sort it might put the whole plant out of operation?

A. As to the purifying capacity, that may be the case, yes.

Q. And as to blast pipes?

A. Well, yes; that might affect individual apparatus, but not the whole plant.

Mr. Page: I want to make a motion to strike out the testimony of this witness as immaterial and irrelevant to any of the issues here. First, that the company ought to be allowed for the plant, the actual value of a plant built to-day that would produce the same amount of gas as this plant, the same as it would cost a new company having the right to make and distribute gas in the City of New York to build a plant, disregarding the old plant entirely. And secondly, they might claim to be allowed—although I do not think under the cases they could be—the value of the capital that they have invested in their plant, and that would be ascertained by taking the original cost of these plants and adding to that the amount of capital that has
been added in the way of additions since that time, and de-
1656 ducting therefrom the proper element of depreciation and
allowing that value; while the evidence of this witness has been entirely directed to the reproducing today new of a plant similar to the old plant—was commercially or economically worth reproducing, as he has testified, and without regard to the cost of producing gas in that plant. Therefore all his testimony and estimates are based upon something that in no way will enter into the final consideration of what is to be allowed this company. And I move that it be stricken out.

Mr. Burr: We make the same motion.

Mr. Mathewson: I do not agree with the Senator's law, but it is, it seems to me, plainly relevant.

The Master: Motion denied; exception to all parties to the motion.

Mr. Page: And further, I move to strike out the witness's testimony on the ground that it is immaterial and irrelevant, the testimony being admitted on the relevancy of the replacement value, that the replacement value of the plant is not the total replacement value of each particular building and apparatus, and to this result alone does the testimony go. It should be as to the replacement of a complete plant.

Mr. Burr: We join in that motion also.

The Master: The same ruling and exception.

Robert A. Carter, recalled and further examined, testified as follows:

Mr. Mathewson: Before you begin Mr. Gans I want to ask one more question, simply to complete the subject that I was examining on.

1657 You testified Mr. Carter, at the last session, as to the method upon which the valuations specified in the tax report of the company were reached. I want to ask whether that method was explained by you before the Gas Commission at the recent hearing last winter.

A. It was, fully, yes, sir.

Q. That was the first time you were called upon to testify on the subject after the Stevens Committee's report, was it not?

A. Yes.

Cross-examination by Mr. Gans:

Q. While we are on that; was that same explanation made before the Stevens Committee?

A. There was the same explanation made.

Mr. Mathewson: Before the Stevens Committee?

The Witness: Oh, no, I misunderstood the question. No, or rather——

(The question is repeated by the stenographer.)

Mr. Gans: If there is to be any qualification of it, do not let us have it stricken out. Let it stand.

The Master: Go ahead, Mr. Carter.

The Witness: The explanation that was made before the Gas Commission was made after I had had an opportunity to refresh my memory——

Mr. Gans: I move to strike that out as not responsive at all.

The Master: Let it go. Go on and answer.

A. (Mr. Carter, continuing.) It was made after I had an 1658 opportunity to refresh my memory as to the method that was employed in arriving at the value of the plant of the company for the purposes of that report by the chief engineer.

Q. Now, all this explanation that you have just made does not affect your answer, that the explanation was not made before the Stevens Committee, does it?

A. The explanation made before the Stevens Committee was that the value given in the tax report was the book value less depreciation, which took into account the removal of the plant to Astoria, and, as I have testified before, I had not had an opportunity at that time to refresh my memory as to the method of arriving at that value. Having done so, I testified before the Gas Commission, and have similarly testified here as to the method.

Q. Let me ask you now, was the explanation which was made before the Gas Commission the same explanation made before the

Stevens Commission. I think you have answered it, "yes," "no," and "I don't know." Let us have your final answer.

Mr. MATHEWSON: This has all been gone over at length.

A. It simply gave in greater detail than I was able to give before the Stevens Committee, the method by which the value given in the tax report was determined by the chief engineer.

Q. Then are we to understand that your first answer was right, and the same explanation was given before the Stevens Committee which was given before the Gas Commission.

Mr. MATHEWSON: Has not this reached a stage where the witness ought to be relieved from repeating over and over again?

Mr. GANS: I think, if the Master will read the testimony, he will find that the witness has given a different answer to the same questions three or four times. 1659

The MASTER: Put them all in evidence, and let me have the benefit of it.

Q. It is not clear in my mind yet. I want to know if you, Mr. Carter, wish to be understood as having made the same explanation before the Stevens Committee, as you did before the Gas Commission of the method of which this tax report was made up.

Mr. MATHEWSON: He has answered the question fully.

The WITNESS: I think that my answer to that question has thoroughly covered the ground. That is my opinion.

Q. Now, having taken the cue from Mr. Mathewson, will you answer the question?

A. I have already testified here that I was called before the Stevens Committee from a sick bed without any opportunity——

Q. I think we have heard that several times.

A. Very well.

Q. Did you or did you not make the same explanation——

Mr. MATHEWSON: If the witness is asked the question and is pushed, I insist that he may answer in his own way.

Mr. GANS: I think it can be answered yes or no.

The MASTER: Go on and answer, but do not go over the whole subject.

A. It is answered in two words, I think, Mr. Master, that I was unable before the Stevens Committee to recall the circumstances which attended the fixing of that value three or four 1660 years prior to the date of my examination; that subsequently to that I did refresh it and testified accordingly with the facts before me, before the State Gas Commission and have similarly testified here.

Q. So there was a difference between your testimony given on these two occasions?

Mr. MATHEWSON: He has not said there was.

Mr. GANS: Then I do not understand English.

Mr. MATHEWSON: You asked him if he made that explanation at that time and he said he did not, and now he explains why he did not.

Q. Do you say that you did not?

A. Did not make the explanation before the Stevens Committee? No. I did not.

Q. That is what I have been trying to get all through this examination.

A. You did not put it so.

Q. Is it not a fact that when you did make your final explanation before the Commission a great many days had elapsed since the time when you gave your original testimony as to the way in which the estimates had been arrived at?

A. You mean between the date of the Stevens Investigation and the Gas Commission hearing?

Q. No, as to the two hearings before the Gas Commission.

Mr. MATHEWSON: He never testified twice before the Gas Commission on that subject He only testified once on that subject; once before the Stevens Committee and once before the Gas Commission.

1661 Q. Is it not a fact that you were asked about the matter before the Gas Commission and that you testified substantially as you testified before the Stevens Committee and that thereafter you were recalled and then gave the explanation you have given?

A. No, it is not a fact.

Q. Now Mr. Carter——

By Mr. MATHEWSON:

Q. Didn't you give that explanation the first time you appeared before the Gas Committee?

A. I did.

The MASTER: Suppose you let Mr. Gans finish his cross-examination.

By Mr. GANS:

Q. I take it you have not the books of the constituent companies showing the capital account at the time of the consolidation?

A. No.

Q. They are not produced?

A. No.

Mr. GANS: I would like to ask, for the purpose of the record, whether you will produce those books without subpœna or whether you will require us to subpœna them?

Mr. MATHEWSON: I have no personal knowledge of where the books are. It is my position that the books are not evidence against this company in any event, and that the material, if they were found, would not be material or relevant. I shall therefore leave you to your own devices.

Q. We asked you some time ago if you would prepare for us or produce the books in which were contained the data for the year 1905, which had been made up for the nominal year ending October 31st, 1905, as Exhibit 145 in the old record, and an exhibit which

has been marked for identification here, but I have not the
1662 number of it. Have you made up any such statement as that?

A. I would like to see the request in the present testimony.

Q. Well, I cannot point it out to you at the moment. It is unimportant.

Mr. Mathewson: I do not remember that the witness was requested to prepare any such matter as that, or that it was understood that he should.

The Witness: It was very clearly understood that I was not to do so, Mr. Gans.

Q. I did not so understand. An exhibit similar to Exhibit 145 in the old Commission records could be prepared by taking the data appearing in that exhibit for the two months of November and December, 1904, and the two months of November and December, 1905, and subtracting the former from the totals here and adding the latter to the totals, could it not?

A. I think that would not be all the labor involved in adapting that report to the nominal year 1905 by any means. There would be a good deal of work in it beside adding two months and deducting two months of operations.

Q. What other labor would be involved?

A. There are a great many rates and quantities and costs per unit, and other things that would have to be adapted also besides dealing with totals.

Q. As I remember, Exhibit 145—look at it again. It just deals with totals and rates.

A. Well, when you vary the quantity, you vary the rate, and it is not arrived at by deducting or adding anything.

Q. And you could arrive at the total amount expended for various purposes by that calculation?

A. I could, but I do not understand it would be an adaptation of that report through the calendar year.

Q. Well, at all events the data are in certain books of the company, aren't they?

A. They are.

1663 Q. What books would I need for that purpose?

A. The operating ledger largely would give that information.

Q. Would I need any other book?

A. I think not.

Q. Well, if you prefer not to prepare such a statement, will you bring down the operating ledger, or bring the months of October and November, 1904, and the months of October and November, 1905, to-morrow?

Mr. Mathewson: I do not quite understand this Mr. Master. The Accountants for the State were at our office and left a week ago last Thursday, with the statement that they had got through. They went there for the purpose, as I understand it, of dealing with such matters as this, and I do not quite see why we should be called upon at this time to go into this subject in this way.

Mr. GANS: We will send them back and make up this statement if you prefer.

Mr. MATHEWSON: That is not the point. Ten days ago, nearly two weeks ago, they left our office.

Mr. GANS: I have been absent for the last ten days, but this is one of the matters I understood we were going to get, and that we were going to get it from Mr. Carter.

The MASTER: I suppose there is no objection to having the experts go up there and make this tabulation or whatever it is from these operating ledgers, is there?

Mr. GANS: How about that, Mr. Mathewson?

Mr. MATHEWSON: I will have to see about it. It is simply a question now, if that has all got to be done, perhaps Mr. Carter will be yanked off the stand while it is being done, while he has been up there waiting and ready to do such things. I will see
1664 how it can be done. It may be that we can do it with our own forces more readily, if it has got to be done.

The MASTER: It all depends as to developments, upon the rest of the case. This may or may not be a reasonable request. If it is going to have the effect of delaying the proceedings as a whole and delaying the closing of the plaintiff's case, then I should say it was unreasonable. If it can be done without inconveniencing anybody, or materially delaying the proceeding, it seems to me it is perfectly reasonable and proper to have that with the other tabulations that were put in.

Mr. GANS: It is the detail of Exhibit 94 which they have handed in, showing this particular year. Might I ask, sir, if you would consider it unreasonable if it involved delay simply because of the time at which the request has been made.

Mr. MATHEWSON: The Master can see what that involves. It begins there (indicating) and goes over to this next place where my pencil is. It is no small matter. My suggestion is that it is too bad, to say the least, that this has been delayed so long, if it was desired.

Mr. GANS: In response to that, I will say this, without consulting the records, that it was said at least two weeks ago and more than that, if my recollection serves me, to Mr. Mathewson, that we would desire this. Mr. Mathewson said, "Oh no, I think you won't." And I replied, "Oh yes, I think we will." Now I think we should not be chargeable with delay. The tabulation could have been prepared.

Mr. MATHEWSON: I don't think there was any request for it; at any rate, I do not recall it.

Mr. GANS: That exhibit shows the cost, station by station,
1665 of the various ingredients entering into the manufacture of gas and also shows the labor entering into it.

Mr. MATHEWSON: It does not cover the cost of distribution, does it?

Mr. GANS: It covers one element of the three, practically, that enter into the final cost, appears to be proved by Exhibit 93 and 94.

The MASTER: What you want is to cover those actual two months?

Mr. **Gans**: Yes, I want it to fit into the exhibit they have introduced, Exhibit 94 or 95.

The **Master**: I should think the simplest way to do would be to let Mr. Gans's expert go up there and make it up.

Mr. **Mathewson**: I do not think they could possibly without Mr. Carter's presence. And I think our men are sufficiently familiar with the books, so if it comes to that we could do it quicker than they could. Do you want to cross-examine him on that when you get it?

Mr. **Gans**: It would depend somewhat on the statement. I might want to ask him some questions.

Mr. **Mathewson**: We might complete his examination and let him devote his time to having the statement made up afterwards.

Mr. **Gans**: I would not want to close my cross-examination definitely, but I should assume there would not be many questions to ask after that statement was made up.

By Mr. **Mathewson**:

Q. How long would it take you to have that statement made up, after you got off the stand, devoting your time to it?

1666 A. I think it might be done in a few days. My understanding is that there is no two months of any kind in this proposition, simply that we reproduce this statement covering the calendar year's operations.

By Mr. **Gans**:

Q. That is right.

A. I think the simplest thing for us to do would be to prepare this.

By Mr. **Mathewson**:

Q. It would be quicker than any other way if it has to be done?

A. Yes.

Mr. **Burr**: Don't you think it would save time if these statements which were presented before the Gas Commission were also carried down to the time embraced in your Exhibits 93 and 94?

Mr. **Mathewson**: There are about two hundred of them. It is utterly impossible for us to do it and close this case within a month or more.

Mr. **Burr**: If you want to leave it that way, of course——

Mr. **Gans**: What exhibits do you refer to?

Mr. **Burr**: A good many of the exhibits I had him identify a little while ago. I want to say in this connection, Mr. Master, that I have asked for certain information which has not been supplied, and I think I made myself clear upon the record that we reserved the right after the report was made by the State experts to question further regarding the information contained in that report if it was not satisfactory to us. I have not seen that report and don't know what it contains. I spoke to Senator Page to-day, and probably to-morrow I will see it and it may contain all the information I want. But I wanted to make myself clear on the record the other day and

I want to make myself clear on the record now. I have
1667 asked for policies of insurance, payrolls and account books,
and I hope that the information that I want and expect to get from those sources may be shown in these statements and I have no desire to protract this hearing unduly, but I do insist upon getting the information which I think is germane to the defence of the City and necessary for us to have from their books, which is the only source for the very vital information we require. If you think well of it, I will submit to Mr. Carter a list of the things which I require and if he can point out that they are in the statements already, I will check it up.

Mr. MATHEWSON: You are to see the reports of these accountants, and their business was, as I understood it, to assure themselves and make it unnecessary for us to do this. It does not seem necessary to make this request until you see what you have and see if your accountants have not covered all this, which I think they have.

Mr. BURR: What I want is, that when this information comes in I may reserve the right to cross-examine upon it.

By Mr. GANS:

Q. It is perfectly feasible to tell from your books the amount of gas manufactured at each one of your stations month by month, isn't it?

A. Yes, sir.

Q. You have reports of that?

A. Yes, sir.

Q. There will be no trouble whatever to give us that for the two periods as to which you have introduced your operating Exhibits 93 and 94.

Mr. MATHEWSON: It already appears in the printed record as to
the nominal year October 31st, 1905, before the Gas Com-
1668 mission. That expressly appears and can be referred to there
without making up a new statement.

Mr. GANS: The amount of gas manufactured at each of the works?

Mr. MATHEWSON: Yes, I think I am safe in saying so.

Mr. GANS: That makes it all the easier.

The WITNESS: So far as the calendar year is concerned, your experts took these figures off from our record.

Mr. GANS: Then it will be all the easier to make up that statement.

Mr. MATHEWSON: But if they have the information, I don't suppose you want us to make it up, do you?

Mr. GANS: I don't think it makes any particular difference which way it is done. It is simply a matter of reading off from reports, isn't it?

The WITNESS: I can make up a statement of that kind, if you wish. Do I understand you want a statement of the gas manufactured at each station each month in the year?

Mr. GANS: Yes.

The **Witness**: And the total, manufactured in the year?
Mr. **Gans**: Yes.
Mr. **Mathewson**: Do you want it month by month?
Mr. **Gans**: I want it month by month.

Q. Have you in your possession the bills for the taxes upon real property which I included in Exhibits 93 and 94?
A. Yes.
1669 Q. Those bills are itemized, aren't they?
A. Yes.
Q. Could you produce those for us to-morrow?
A. I will.
Q. I understand it has been your habit, Mr. Carter, to get from your engineering department, reports from each one of your works, showing either the cost of the operation of that particular plant or some figures which are embraced in the cost of operation and that it has been your habit to keep those reports for the purpose of comparison?
A. I have no knowledge of anything of the sort.
Q. Do you remember testifying to something somewhat similar to that before the Gas Commission, or am I mistaken?

Mr. **Mathewson**: You are mistaken, Mr. Gans.

(Mr. Gans requests the stenographer to read the last two questions and answers, which is done.)

Q. Well, after having had my question read, do you still say you haven't any figures such as my question refers to?

Mr. **Mathewson**: No, he didn't say so. You asked him whether the engineering department didn't furnish figures for the purpose of comparison.
The **Witness**: The engineering department is not able to make up any figures of cost. They don't know what the materials they are using cost the company.

Q. Well, have you from any source any such tabulation as I have referred to? That is, either a tabulation showing the entire cost of gas at each one of the stations, or showing certain elements of the expense.
A. I have such statem[illegible].
1670 Q. And you keep thos[illegible]
A. I do.
Q. Have you those as a part of the record of your department?
A. Memorandum for my personal requirements.
Q. You keep them in the files of your department.
A. Yes, they are in my desk.
Q. Have you anywhere any record showing definitely and specifically and accurately the cost of manufacture of gas at each one of your works?
A. Yes.
Q. Except as aggregated in the general ledger?
A. We have some by stations. I have receipts that show the cost at each station each month.

Q. Wherein do these reports that you speak of differ from those I have just asked you about which you said you had not made up?

A. You asked me for something that was prepared by the engineering department—received by the engineering department and given me monthly by the engineering department. These figures do not come from the engineering department; they are made up for me by the accounting department.

Q. Then the point wherein I was mistaken was as to their coming from the engineering department?

A. Yes.

Q. So you have made up and kept as part of your record from your own department, a statement of the cost of manufacture for each one of the plants, for each month, showing the items and elements of that cost?

A. I have such statements.

Q. Now would you be good enough to bring those statements for the nominal year and the actual year, the one ending October 31, 1905, and the other being the actual year of 1905.

Mr. MATHEWSON: Wasn't that covered by your accountant?

Mr. GANS: I assume not. I assume it would be utterly 1671 impossible in the time they devoted to those books to have done more than to rather superficially check up the general accuracy of the books?

Q. It was developed in the course of the examination of Mr. Franklyn, I think, that $1,800 rent which was paid by the National Coal and Coke Company, was paid to the Consolidated Gas Company. Mr. Mathewson informed us of that fact in the course of the examination. Are there any other payments that were made by the National Coal and Coke Company to the Consolidated Gas Company except such payments as are made for the purchase of coke?

A. I think quite likely.

Q. Where would those appear?

A. They would appear as a charge against the National Coke and Coal Company upon our books.

Q. And they would enter into your miscellaneous revenue, wouldn't they?

A. I do not mean by that technically the miscellaneous account, but they would not enter into the operating expenses of the company, would they? Or as a reduction of the operating cost?

A. That would depend on the nature of the charge, what it was for.

Q. This is a payment by the National Coke and Coal Company to the Consolidated Gas Company?

A. They would not pay us anything we did not charge them for, I presume.

Q. No, I presume that also. Then the place to find these various items would be the ledger account of the National Coke and Coal Company in your ledgers?

A. That would be the place to find any charge against the National Coke and Coal Company for anything furnished them, either coke or supplies of any kind that they buy from us as a matter of convenience.

Q. And of course all the amounts paid by the National 1672 Coke and Coal Company enter into their operating expenses?

A. Not necessarily. It would depend upon what they bought. It might be something for construction purposes, in which case it would not enter into operating expenses.

Q. Do they do any constructing, the National Coke and Coal Company?

A. I think they might.

Q. Well, do they? You know about their operations?

A. I am not aware of their doing anything of that sort at the present time.

Q. So that suggestion would not cover the case, would it?

Mr. MATHEWSON: Yes, it would, if there were any, of course. He said that it would not be charged to the operating expenses if it went into construction. If they bought new horses and carts, that is construction in a bookkeeping term. It seems to me you are extremely technical and almost offensive in your examination.

Mr. GANS: It seems to me the witness is able to take care of himself.

The MASTER: Proceed, gentlemen.

A. It would go into their operating expenses if it was an expense of that nature, and not otherwise.

Q. In which of the two ledgers is that account kept?

A. In the sundry debtor ledger.

Q. Has that ledger been examined, Mr. Cuthbert, while you have been there; that is, do you know whether that ledger has been examined by Mr. Cuthbert?

A. Yes, it has been.

Q. Do you know whether that particular account has been examined by Mr. Cuthbert?

A. I don't know.

Q. In the event that he is not able to make a report on the account you have no objection to producing that ledger containing that account?

A. None.

1673 Q. Now, I don't know whether you have been asked, Mr. Carter, whether your company is now testing the tax imposed for the year 1905 by both the State tax and the franchise tax?

A. Not the State tax. The State tax for 1905 has been paid. The franchise tax is being contested.

Q. Any other tax being contested for that period?

A. For 1905?

Q. Yes.

A. I think not.

Q. Have you any knowledge as to the original capacity of your works, that is in 1884?

A. No.

By Mr. **Page**:

Q. Pursuant to my request, have you produced a summary of operations of the National Coke & Coal Company for the year 1905?
A. Yes, sir (producing paper).

Mr. Page: I offer that in evidence.
Received in evidence and marked State's Exhibit O.

Q. And you have also produced, have you, a statement of the coke produced, sold in manufacture and produced for sale by the Consolidated Gas Company for the year 1905?
A. Yes, sir.

Mr. Page: I offer that in evidence.
Received in evidence and marked State's Exhibit P.

Q. You have also produced pursuant to my request balance sheet of December 31st, 1903?
A. Yes, sir.

Mr. Page: I offer that in evidence.
Received in evidence and marked State's Exhibit Q.

1674 Q. You have also produced the balance sheet of December 31st, 1904, of the Consolidated Gas Company?
A. Yes, sir.

Mr. Page: I offer that in evidence.
Received in evidence and marked State's Exhibit R.

Q. You have also produced the balance sheet of December 31st, 1905?
A. Yes, sir.

Mr. Page: I offer that in evidence.
Received in evidence and marked State's Exhibit S.

Q. Referring to State's Exhibit O, I notice four items entered here in red ink, will you kindly read those items and state why they are in red ink?
A. There are but three items, one being a repetition of the other. The first item is $22, and is the difference in the price per load of certain coke, which operated to reduce the cost of the coke they purchased by that amount. The next item is included in the operating expenses as a credit item, cartage, $13,234.42, representing a credit balance in that account for the year. The next item is interest, $17.48, representing the credit balance in their interest account for the year, and shows in operating expenses as a credit item and operates to reduce the total expenses for the year.

By Mr. **Mathewson**:

Q. The fact is that those items in red ink on this Exhibit O mean deductions and not additions?
A. That is a brief description of it, Mr. Mathewson.

By Mr. Page:

Q. State's Exhibit O shows the operations of the National
1675 Coke & Coal Company for the year 1905 alone. That is,
I mean by that there is nothing carried forward from any previous year on that statement?

A. That appears to be the case.

Q. And the net earnings for that year are $10,596.33?

A. Yes, sir.

Q. Of which dividends are paid to the Consolidated Gas Company as being the owner of the entire stock, of $5,000?

A. Yes, sir.

Q. Leaving a surplus that was earned by the company on its coke operations alone for that year of $5,596.33?

A. Yes, sir.

Q. I notice in Complainant's Exhibit 94, that you have under the head of Residuals, coke, 167,071.70 loads at $2.02 per load, while State's Exhibit O accounts for 145,435 loads. Is that correct?

A. That is correct.

Q. To whom was the balance of the 22,000 loads approximately of the coke sold?

A. I don't think it was sold at all, Senator, or more than a very small portion of it. The bulk of its was used in water gas stations and used in other departments than the manufacturing department.

Q. I think you testified before that the coke used in tons, 19,892.54 was the coke that was delivered and used at the water gas station, and that that was additional, was it not, to this coke of 167,071.70 loads?

A. No, I have not so testified, no, sir.

Q. Your testimony is that 18,892.54 was taken out from the 167,071.70 loads?

A. It is a part of that Senator. It is included in that as coke accounted for in the residuals.

Q. Referring to the item of street lamp account on Exhibit 94, you carry there as a debit balance $289,259.09. Will you state of what that debit balance is composed?

A. It is composed of the amounts expended by the company for the maintenance of public lamps and for erecting and re-
1676 pairing public lamps, less the amount charged to the city for erecting and repairing public lamps.

Q. That is, if I understand your explanation, it would be the amount that it cost you to maintain, erect and repair the public lamps in excess of what you receive from the city for the same?

A. For erecting and repairing only.

Q. Referring to State's Exhibit G, repairing street lamps, $10,986.50; is that not the item that you charged the city for the year 1905 for repairing street lamps?

A. That is the amount we charged the city for that work. It is not the cost of it, however.

Q. On August 31st you transferred from your journal from public street lamp account to the gas sales account the sum of $151,690.41. Why was that done?

A. I have already explained, Senator, that we abandoned our practice of estimating the cost of lamp maintenance and treating it as a credit to the street lamp account, and included in the gas sales account the entire amount that we had charged the city for supplying gas to, lighting and maintaining the public lamps, there being no division of the amount charged the city between the amount charged them for the gas and the amount charged them for the maintenance.

Q. You sold to the city, per meter service, 127,746,300 cubic feet of gas at 90 cents, according to State's Exhibit G, didn't you?

A. Yes.

Q. And you also estimated the amount as applicable to street lamps, 270,779,670 cubic feet, didn't you?

Mr. MATHEWSON: Is that by the same exhibit?

Mr. PAGE: Yes. State Exhibit G.

A. Yes, sir.

Q. And you have carried out as having received on that 1677 account the sum of $565,241.39?

A. Not as received.

Q. Well, as charged?

A. Yes.

Q. For which you expect to receive pay, of course?

A. Hope to.

Q. Now, if we take that gas at 90 cents and deduct the results from $565,241.39, will we not have a credit that is applicable to the maintenance and repairs of street lamps?

A. If we assume that the quantity estimated was correctly estimated, which we know is not the case.

Q. On Exhibit No. 94 you state the entire amount of your gas sold to be 13,283,163,767 cubic feet, is that correct?

A. Yes, as recorded in our accounts, but as I have already testified, we do not meter the gas that is supplied the city. It is an estimate, estimated at the quantity stipulated in the contract, although we know we are supplying more gas than that.

Q. In arriving at that amount of gas sold did you not include as sold the 217,779,677 cubic feet, that has been shown on Exhibit G, as being the amount estimated to have been supplied the city for public lamps?

A. We did.

Q. And all your computations as to the cost of gas per thousand sold have been based upon that figure?

A. They have.

Q. So that for all purposes of your bookkeeping, and estimating your cost prices, that amount has been included as the actual amount of gas sold?

A. Yes.

Q. Now, if we multiply that 270,779,677 by 90, we will get the amount that is chargeable to the city on account of the gas that was sold to them for street lamps?

A. Assuming that estimate is correct.

Q. You have used it, and assumed it to be correct in all your books of account?

1678 A. Our employment of that quantity we assume did not change the quantity that we estimate we are supplying the lamps.

Q. That would be what?

A. $243,702.71.

Q. And assuming that as a factor you find that your unaccounted for gas in 1905 was only what per cent.?

Mr. MATHEWSON: 2.24, I think.

A. That is the case.

Q. If we take that $243,702.71 from the $565,241.39, as shown on Exhibit G as having been received for public lamps, including lighting and maintaining, we have the result of $321,539.68. If that amount was credited to the street lamp account, instead of having a debit balance, you would have a credit balance? You wipe out the $289,259.09 entirely and produce a credit?

A. I do not know upon what theory you would so deal with the item. That we made any profit at all is purely problematical. As a matter of fact we believe that the gas we supply the city at the rate of ninety cents per thousand would leave something to add to what appears in the street lamp account, $289,259.09, representing a loss on maintenance of lamps instead of a profit on them.

Q. I know; that is the theory under which you proceed, but you have a percentage of unaccounted for gas of only 2.24 per cent. Do you know of any other gas company in the United States that operates under so low a percentage of unaccounted for gas?

A. I have heard of companies where they operated a little closer than that.

Q. Don't you know that it is usually from 10 to 15 per cent.?

A. I think in our own case 20 years ago it was nearer 15 per cent. than anything else.

1679 & 1680 By Mr. GANS:

Q. You receive from the companies operating under the agency agreement statements of the amount due under that agreement, in some itemized form, do you not, month by month?

A. Yes, we do, your accountants saw several bills with all the data accompanying them.

Mr. MATHEWSON: They wanted to see them in order to check them with their notes, and they did.

The WITNESS: In fact, they copied them entirely.

Mr. MATHEWSON: Mr. Carter let them copy one or two and take them away so as to show you.

Mr. GANS: There would be no difficulty in producing them?

The WITNESS: None whatever.

Mr. MATHEWSON: No, but I do not think you would want them.

Mr. GANS: They would not be very bulky? I do not know what they are like.

The **Witness**: No, they are not bulky.

At 6 P. M. adjourned to to-morrow, September 5, 1906, at 11:30 o'clock A. M.

Last Exhibits:

Complainant's 223.
State's S.
City's 34.

1681 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; **William Travers Jerome**, as District Attorney of New York County; **Frederick E. Gunnison**, **John C. Davies**, and **Lucian L. Shedden**, Constituting the New York State Commission of Gas and Electricity, and **The City of New York**, Defendants.

Before Arthur H. Masten, Special Master.

Met pursuant to adjournment.

New York, Wednesday, *September 5th*, 1906.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Burr, Mr. Gans.

1682 **Robert A. Carter**, recalled and further examined, testified as follows:

Mr. **Burr**: I want to offer in evidence certain statements from the Gas Commission records.

I offer in evidence pages 961 to 963, being the statement of Mr. Bradley's cost sheets, giving his monthly record of the cost of certain items entering into gas manufacture at each station for each month from October, 1904, to September 30, 1905.

Mr. **Mathewson**: It was from Mr. Carter; it was part of the statement produced before the Commission to which I referred yesterday, and which was explained to the Commission as incomplete and fragmentary, and which the Commission said they had simply wasted time on in its present form.

Mr. **Burr**: You may give the same explanation with regard to that statement which you gave before the Gas Commission, if you think proper.

Mr. **Mathewson**: I am simply calling your attention to it, thinking that when you know what it is that you will not think it is proper to put it in. I do not object to your putting this in if you think it is in any way material under the circumstances.

Received in evidence and marked City Exhibit 35.

Mr. Burr: I offer in evidence Exhibit 105, appearing on page 2034-A of the proceedings before the Gas Commission, purporting to be a statement of gas made for the Consolidated Gas Company by other companies net for the nominal year ending October 31st, 1905, and which Mr. Carter has testified, I believe, was made under his supervision, or by him.

1683 By Mr. Burr:

Q. Is not that so, Mr. Carter?
A. Yes, sir.

Received in evidence and marked City Exhibit 36.

Mr. Burr: I offer in evidence Exhibit 110 before the Gas Commission, appearing on page 2035 of the proceedings, being the statement of labor cost of the 14th Street station from October 31st, 1904, to October 31st, 1905.

Received in evidence and marked City Exhibit 37.

Mr. Burr: I offer in evidence Exhibit 134 before the Gas Commission, appearing on page 2069, of the proceedings before that Commission, being the 42d Street works labor cost for the twelve months, ending October 31st, 1905.

Received in evidence and marked City Exhibit 38.

Mr. Burr: I offer in evidence Exhibit 138 before the Gas Commission, appearing on page 2072 of the proceedings, being the statement of the 44th Street Station labor account, November 1st, 1904, to November 1st, 1905.

Received in evidence and marked City Exhibit 39.

Mr. Burr: I offer in evidence Exhibit 142, offered before the Gas Commission and appearing on page 2075 of the proceeding, being the statement of the labor cost at the 99th Street Station, October 31, 1904, to October 31, 1905.

Received in evidence and marked City Exhibit 40.

Mr. Burr: I offer in evidence Exhibit 143 before the Gas Commission, appearing on pages 2076 to 2082 of the proceedings before that Commission, being an analysis of the changes in cost at the
1684 various stations between September, 1904, and September, 1905.

Received in evidence and marked City's Exhibit 41.

Mr. Burr: I offer in evidence Exhibit 147, offered before the Gas Commission and appearing at page 2137 of the proceedings, purporting to show cost of meters.

Received in evidence and marked City's Exhibit 42.

Mr. Burr: I also offer in evidence Exhibit 148, offered before the Gas Commission, appearing at pages 2138-9 of the proceedings, purporting to be an analysis of costs of meters and pipes.

Received in evidence and marked City's Exhibit 43.

Mr. Burr: I also offer in evidence Exhibit 149, offered before the Gas Commission, appearing on pages 2139 to 2156 of the proceedings, being a statement of plants and operations for the nominal year ending October 31st, 1905.

Received in evidence and marked City's Exhibit 44.

Mr. Burr: And I submit for the record a statement which I have handed to the witness of information desired, and which I ask him to produce as follows:

1—Page 900: Manufacturing capacity of each station in 1884 in coal gas, and likewise in water gas.

2—Page 900-901: Contracts and vouchers for all the holders constructed since 1884, and giving, separately from the holders, the foundations, valve houses, etc., for each holder.

3—Page 901: Number of services in use Dec. 31 of each year since 1899.

1685 4—Page 901: Number of new services laid from Jan. 1, 1900, to Dec. 31, 1905, by sizes.

5—Page 901: Cost of all these services laid from Jan. 1, 1900, to Dec. 31, 1905, including cost of laying and valves, boxes, etc., connected therewith.

6—Page 901: Interest paid yearly on the bonds and debentures or other indebtedness of the Consolidated Company since 1884.

7—Page 901: The principal of said bonds, debentures or other indebtedness each year since 1884.

8—Page 901: Average annual quotations on said bonds or debentures since 1884.

9—Page 902: Average quotations of the debentures of 1904 during 1904 and 1905.

10—Page 905: Amount of gas received, price paid for same, from each company under the Agency Agreement during each month from January 1, 1904, to August 1, 1906.

11—State the date of the largest sales during 1905 by each of the companies with which the Consolidated has agreements, and the amount of the sales on said date, including in said sales not only those to the Consolidated Company, but to all others.

12—Total manufacturing capacity in coal gas, and likewise in water gas, of each of the companies with which the Consolidated has agency agreements.

13—Complete to August 1, 1906, the monthly table of the cost of gas at each station which was given from Oct. 1, 1903, to Oct. 1, 1905, on pages 961-963 of the printed record of the case before the State Gas Commission. If this is impossible, complete up to May 1, 1906.

14—Read into the case in this connection said pages 961 to 963, and any necessary explanatory matter immediately before or
1686 afterwards in connection with the testimony or cross-examination of Mr. Bradley.

15—Bring in all the bids, whether successful or not, in connection with the holders constructed since 1884, or, if that is impossible, then for as many years as the records have been kept.

16—Do the same for pipe, and for all other items of construction involving in each case more than $5,000.

17—Payroll for December, 1905.

18—Produce existing policies of insurance.

19—Produce the vouchers for the holders built since 1895.

20—Produce the vouchers for all apparatus or buildings costing more than $5,000 since 1895.

21—Produce the vouchers for oil during 1905 and 1906 up to Sept. 1st.

22—Give the age of all apparatus and buildings costing more than $1,000 and testified by Mr. Mayer in cases where he did not give the age.

Mr. BURR: Also please furnish the amount of gas consumed by the Consolidated Gas Company for its own use in the years 1904 and 1905, and a statement of coal used by each station and by each subsidiary company, which you agreed to furnish at the time the book itself containing that information was produced here and from which you were examined.

Mr. MATHEWSON: No, sir. There was no request made that he should furnish the amount of coal used by each subsidiary company. He was requested to state the amount of the various contracts which were used by the companies in which the Consolidated 1687 owned stock. I think you will find no record of any request that he state how much coal was delivered to each subsidiary station of the Consolidated Gas Company.

Mr. BURR: Well, I remember that is the line of information we were pursuing at the time we had the book here, and if I did not ask it that is what we intended to request. If he can produce one he can produce the other, I assume.

Q. And with regard to the trial balance, Mr. Carter, which was produced here yesterday, I believe you were to add to that at the request of Mr. Gans, the months of November and December, isn't that so?

A. The trial balance produced here yesterday? No, sir, I have no recollection of any request of that nature.

Q. Have you produced any trial balance for the year 1905 in this case?

A. There was prepared for you trial balance sheets covering 13 months from October 31, 1904, to December 31st, 1905, inclusive.

Q. That covers up to December 31st, 1905?

A. Yes.

Mr. PAGE: I put in evidence yesterday, Mr. Burr, trial balance sheets for 1903, 1904 and 1905.

Mr. BURR: Up to the 31st of December, 1905?

Mr. PAGE: Yes.

Q. With regard to your last trial balance sheet up to December 31, 1905, I want to ask whether all the accounts at the close of the year were embraced in that trial balance?

A. If it is a trial balance, no. If it is a balance sheet of that date, yes.

Q. Was that trial balance made before the books were closed or after the books were closed for that year?

A. I would like to see the exhibit before answering that 1688 question and find out whether it is a trial balance or a balance sheet you are referring to. (After conferring with Mr. Page.) The closing entries had all been made before that balance was taken off from the ledger.

Q. For the year 1905?

A. For the year 1905.

Mr. Page: It was a balance sheet; not a trial balance.

Q. I have yet to learn from any statement you have made or from any exhibit you have offered in evidence here what the Consolidated Gas Company claims is the cost of making and distributing to the burner 1,000 cubic feet of gas. Do you know what it is?

Mr. Mathewson: What is that?

Mr. Burr: I ask him, as Secretary of the Consolidated Gas Company, to state here now what he claims is the cost of manufacturing and distributing to the burner of the consumer a thousand cubic feet of gas?

Mr. Mathewson: I will say in reply to that, that the exhibits which we have put in show the expenditures and a computation on that basis is as available to Mr. Barr as it is to us. As to the actual amount which should be charged to the cost of 1,000 feet of gas, we shall put on other witnesses who will testify on that specific point. Mr. Carter has not prepared himself to do so, but simply to present the figures which he has presented.

Q. Then I will ask, do you charge against the cost of the manufacture and distribution of gas at the burner to the consumer, all the items which appear on your Exhibits 83 and 94?

1689 Mr. Mathewson: That is a statement, if the Master please, which shows the expenditures of the company. I don't know that any specific schedule showing the charges against the cost of gas is made up except the figures that are presented and will be presented here.

Mr. Burr: Now, you see, Mr. Master, we have been wandering around in a sort of a quagmire, and a want to get on *terra firma.* I want the company, here, through its representative, to say, as it ought to be ready to say, what is their claim regarding the cost of the manufacture and production and distribution to the consumer of a thousand cubic feet of gas as the conditions exist now, or as they existed when this proceeding started. I think that is a fair question. And if he says that it appears in any statement here, in any exhibit which has thus far been presented, I want him to point it out. I think that also is a fair question.

Mr. Mathewson: Do not be impatient and you will get it, but you cannot expect one witness to prove the entire case. You will have it, if you will only wait a little until we can put the witnesses on who can testify on that subject. Mr. Carter merely testified to facts——

Mr. Page: You are going to.

Mr. Mathewson: Certainly we are going to. Mr. Carter only testified to facts from the books, and it is a question to my mind as to whether one item or another as to which you raise the question is charged against an account which is called "cost of gas." You do not find any entries in the ledger such as "Charges against the cost of gas."

Mr. Burr: No, I think you leave it very hazy.

Mr. Mathewson: We shall not if you give us time to put our case, but do not ask this witness to testify on the whole propo-
1690 sition, which he cannot do because he is not an engineer.

Mr. Burr: I ask this officer of the Consolidated Company if all the items which appear upon Exhibit 93 and all the items which appear upon Exhibit 94 submitted here by the complainant are charged as a matter of fact against the cost of the manufacture and distribution to the consumer at the burner of 1,000 feet of gas?

The Master: Charged on what? Who charged, and where charged?

Mr. Burr: Charged by the Consolidated Gas Company as the expense or the cost at the burner of a thousand cubic feet of gas.

The Master: Is not that a matter of construction and argument? Does it not appear in the bill of complaint what they charge as the cost of a thousand cubic feet of gas? And have they not got to sustain that by proof of facts? I do not understand that a ledger account has any "cost" heading, has it, specifically?

Mr. Burr: Yes. You remember, Mr. Master, on Exhibit 93, 72.12 cents appears as the cost made out by this summary of operations for the nominal year ending October 31st, 1905; cost per thousand cubic feet of gas sold. That is the heading; 72.12 cents is the entry.

The Master: Does not that show for itself that the items are distinct in there?

Mr. Burr: If you let me finish, if you please.

The Master: Certainly.

Mr. Burr: Exhibit 94, under the same heading, cost per thousand cubic feet sold, indicates 74.81 cents. Now I ask, does he charge up against the cost of the manufacture and distribution to the consumer at the burner, of one thousand cubic feet of gas all the
1691 items which appear upon this summary of operations for the
nominal year ending October 31st, 1905, Complainant's Exhibit 93, and all the items appearing upon the summary of operations for the calendar year 1905, being Complainant's Exhibit 94.

The Master: When you say "does he charge that," what you mean is in arriving at that percentage on those exhibits?

Mr. Burr: Yes.

The Master: Well, you may ask him to explain how he arrives at that percentage stated on those exhibits to be the cost. That is a proper question. He may explain it, if he can.

Mr. Mathewson: I want to say, Mr. Master, this witness is not an engineer, nor is he an expert.

The Master: If he does not know he can say so.

Mr. Mathewson: There are others whom I shall question on that subject.

The Master: You may answer it, Mr. Carter.

A. The rates per thousand cubic feet that are shown in Exhibits 93 and 94 are calculated by taking the various amounts and dividing them by the total quantity of gas sold during the year.

Q. Then all these items do enter into producing the result of 72.12 cents on Exhibit 93 and 74.81 cents on Exhibit 94?

A. That is the result of that calculation; yes, sir.

Q. Are any of these items appearing on either of these statements to be eliminated, in your opinion, in getting up the cost of gas per thousand cubic feet?

Mr. **Mathewson**: I make the same objection, that the witness is not an engineer or expert.

1692 The **Master**: I do not see that that is a competent question to ask the witness. It is a matter of argument.

Mr. **Burr**: You will remember there are some items here, "general expenses, interest, taxes," and one thing or another. It clearly appears upon the record that so far as those things are affected or affect the stocks, they have to be considered as affecting the price of a thousand cubic feet of gas. It is conceded that on both these exhibits such entries do appear, and I want to know whether he is now prepared, as the financial officer of the company, to say that all these items are to be taken into consideration in figuring up the actual cost of a thousand cubic feet of gas, or whether some of them are to be eliminated, and, if so, which are to be eliminated from the consideration of the problem.

The **Witness**: I think I might perhaps explain in a word or two the method by which we arrived at the profits from our business during the year, and as the result of a year's operations. We credit our profit and loss account with income from the sale of gas, from miscellaneous sources, and from the securities of other companies. Against that we charge in the profit and loss account all of the expenses, as shown in Exhibit 94, for the calendar year. The balance represents the profit for the year. We make no application of any particular items of expense against any particular items of income, dealing with both in the gross.

Mr. **Burr**: That is all for the present.

Mr. **Gans**: There are a few questions I can ask the witness, 1693 but until he furnishes the information I requested I cannot proceed very far.

The **Master**: I understand your cross-examination is delayed now on account of the absence from town of your expert.

Mr. **Gans**: It is delayed by both things. I could have gone on in the absence of the expert if these matters which have been asked for had been produced to-day.

Mr. **Mathewson**: What did you ask for which could possibly be produced to-day?

Mr. **Gans**: I asked for the statement of the operating expenses of each one of these works, which are part of the files of the Company, and which could have been produced without any difficulty, I should assume. Mr. Carter says they could not. I was wrong in my assumption. There are one or two questions I would like to ask Mr. Carter, though.

By Mr. **Gans**:

Q. Included in your miscellaneous income, as appearing on the books of your company, are discounts on materials purchased to the amount of $9,497.57. Is there not such an item?

A. Yes.

Q. Those materials are materials the cost of which enters into the amounts charged on Exhibit 94, and go to make up the total of that amount of $9,936,910.42, do they not?

A. No, sir, not necessarily. They may in part. That represents discounts on the purchase of a great many things that might not go into the operating expenses at all. They might go into our property account.

Q. Then can you tell us to what extent the discounts are discounts on materials which did enter into this total on Exhibit 94?

1694 A. Probably, as the result of a great deal of labor, we might go through the year's record of discounts and separate them in that way.

Q. Another item of your miscellaneous income is real estate rents aggregating $37,408.88, is that right?

Mr. Gans: I got these figures from the accountants, and of course I don't know whether they are right.

Mr. Mathewson: Look at your own data, if you have it, to verify that.

A. That is correct.

Q. I understand there appears on your books also an amount as a rebate on oil purchased to the amount of $50,000; is that right, or, rather, the amount of $112,000?

A. Occurring during the period covered by these statements?

Q. Well, as a rebate on the books covering this period.

A. There is nothing appearing on the books covering either the calendar year of 1905, or the nominal year ending October 31st, 1905, of that nature.

Q. Do you mean that there isn't any entry on the books which were in use at that period of a rebate received during that time.

A. During the year 1904 there would appear upon the books a record of an adjustment, improperly termed a "rebate," representing the adjustment of a variation between the prices of oil under two contracts. The matter was fully explained to Mr. Cuthbert at the time he was at the office.

Q. Was that money received during 1905?

A. No, it was not received during 1905; nor during the nominal year ending October 31st, 1905.

By Mr. Mathewson:

1695 Q. Might you not in that connection explain a little more fully what that adjustment was so that we can understand it?

A. We had occasion early in the Summer of 1904 to change the grade of oil that we were using. The new oil was at a lower price. The understanding was that we were to pay the price under the old contract until it was exhausted, until the quantity stipulated was exhausted, in a month or two, at the end of which time we would receive a credit representing the difference between the price of the two oils.

Q. Which were of different grade.

A. Which were at different rate.

Q. And this adjustment is simply the difference and not a rebate on the price at all.

A. Simply an adjustment between two prices and in no sense a rebate.

By Mr. Page:

Q. I suppose you refer to the new contract which was made in June, 1904?

A. In June, 1904.

Q. That provided for oil of a grade of 28 Baumé, to be furnished at a price of 4.04 cents a gallon, the new contract.

A. That is the case.

Q. What price was provided to be paid by the other contract, so obviated by that contract?

A. I should have to trust to my memory. I think it was 4⅜ cents a gallon.

Q. 4⅜?

A. Yes, sir. That would be 4.375 cents.

Q. Now taking that to be the figure, will you state how much oil was furnished on the old contract and rebated at $112,000?

A. The figure you name, to the best of my recollection, covered the adjustment for all the companies who were receiving oil under that contract.

Q. Certainly.

A. As we were the contracting parties it went through our accounts, and from memory it would be impossible for me to 1696 say the number of gallons that were delivered that were subject to that adjustment in price.

Q. It would be a matter of very short computation, wouldn't it, to take the difference in price and make the calculation as to how many gallons it would take to make $112,000?

A. It seems a pity to spread on the record my recollection of the price and quantity. I can get that information exactly if it is desired.

Q. Well, it would be quite a large quantity of oil, wouldn't it?

A. Yes?

Q. Then, that contract that was made in 1904 was for 177,000,000 gallons of oil and was to run to June, 1906, and on October 31st, 1905, you made a new contract at a higher price, didn't you?

A. Yes, we were obliged to do so because the higher candle power established by the law which went into effect July 1st, 1905, could not be maintained with the grade of oil we were getting under the contract of June 1st, 1904.

Q. Why not?

A. Well, you will have to get the engineers to answer that question. It would be too technical for me.

Mr. Mathewson: Mr. Bradley expressly recommended it and said that he would not undertake the responsibility of running through the winter and supplying 22-candle power, using the same kind of oil that we had been using before, and the other contract expired, I think, in April, 1906, or such a matter, so that it practically made no difference. We made the best trade we could.

Q. The contract that was made for 1905 and superseded the June, 1904, contract provided for a much higher price for the same grade of oil, didn't it?

1697 A. Yes, but it insured our getting the oil at that figure for the next three years, whereas we had but a comparatively short term during which the then contract would continue in force.

Q. There was, however, a very large amount of oil that was still to be delivered under the terms of the June, 1904, contract, was there not, at a lower price?

A. Yes.

Mr. Mathewson: But not of the higher grade of oil that was needed in the winter. That was the point. That was pretty nearly exhausted. The fact that we could get a low grade of oil did us no good at that time.

Q. You produced here your oil account, and that shows from October 31st, 1904, to October 31st, 1905, that you had used 82 million gallons of oil. Do you recall that fact?

A. To the Consolidated alone?

Q. No; what was delivered under that contract, as shown by the account which you produced here, by your books, and which we entered quite fully upon the record.

A. I do not recall the figures.

Q. You recall, do you not, that the account which you brought down here commenced with the 1st of November, 1904?

A. I do not know what account you are referring to; I do not recall any account commencing November 1st, 1904.

Q. I am referring to the book which you produced here that showed the deliveries of oil, which was City's Exhibit 34 for identification, and if you will turn to page 1015 of the record you will see that your testimony commences:

"It means the quantity delivered between the 1st of November and the 29th of November, which was the last day of November, aggregated 6,190,868 gallons."

A. I think that was 1905, not 1904.

1698 Mr. Mathewson: The examination did begin with 1905. Then it took up December, 1905, according to my recollection.

Q. Here is the question, at page 1025:

"I will ask you what the total, 82,061,124, on page 242 of this book in column 'Gallons as per invoice' refers to? A. It refers to the total quantity of oil delivered between September 28, 1904, to October 31, 1905."

A. Under the particular contract which was recorded on that page of the contract record.

Q. That was under the contract of June, 1904, which called for the delivery of 177,000,000 gallons of oil, didn't it?

A. To the best of my recollection, it was.

Q. Now, on November 1st, 1905, you made the new contract to which you referred, didn't you, calling for the delivery of oil at a higher rate, didn't you?

A. Yes.

Q. And that contract called for the delivery of 255,000,000 gallons of oil at 28 degrees and 34 degrees Beaumé?

A. That is right.

Q. Portions of the deliveries were changed, however, from the contract of June, 1904, providing for 25 per cent. of 34 degrees and 75 per cent. of 28 degrees Beaumé, while your contract of November 1st, 1905, called for 40 per cent. of 34 degrees and 60 per cent. of 28 degrees?

A. That is correct.

Q. If, from September 28, 1904, to October 31, 1905, there had been delivered to you under the contract for 177,000,000 gallons, 82,000,000 gallons of oil, can you, with those figures before you, state what was delivered between the first of June and the 28th of September?

Mr. Mathewson: 1904?

Mr. Page: Yes.

1699 A. You are asking me a question, and I do not know that I can answer it unless you can refer me to something that will help me. I do not know that I can give you that information from that record.

Q. Will you refer to the books of the Company in order that we may have the information furnished to us accurately as to how much oil was delivered from the various companies, stated in the same manner that this is on the record, from page 1015 over to page 1026, between the first day of June and September 28th, 1904?

Mr. Mathewson: Can that be done without much trouble, Mr. Carter?

The Witness: Not without trouble, but it can be done.

Q. The amount of trouble that would be involved in doing that would be going to your office and opening your ledger that had the account——

Mr. Mathewson: He is willing to do it.

Mr. Page: Wait a minute; we will see.

Q. (Continuing:) —opening your ledger to the account which would show the oil delivered, and copying the total items which are there footed for each month, for the months of June, July, August and September, would it not, four entries?

A. Assuming that the same marginal entries appear there.

Q. And if the same marginal entries do not appear, it would mean the mere adding up of each month from the items appearing thereon for four months, would it not?

A. That would be about the labor involved.

Mr. Mathewson: I do not think it is material, if the Master please. I shall not object, but I do not think it is material. 1700 This is in 1904, entirely outside of the period that we are investigating.

Mr. Page: I think the Master will see the application.

Mr. Mathewson: I do not think that there is any, but I have no objection to his doing it. We are getting pretty well loaded up with things called for already.

Mr. Page: Do I understand that you will do that?
Mr. Mathewson: Yes.

Q. You can go to the telephone and telephone to a clerk now and have it prepared and ready for us this afternoon, can you not?

A. My clerks are very busy just now, preparing stuff called for yesterday, and will be for several days.

Q. There was a very substantial amount of oil still remaining to be delivered under that contract.

A. What contract are you referring to?

Q. I was just going to tell you—of June, 1904.

Mr. Mathewson: Remained by November 1st, 1905?
Mr. Page: Yes.

A. I should say quite a quantity.

Q. Irrespective of how much oil may have been furnished that was credited to the old contract and rebated?

A. And adjusted as to price.

Q. If you want to put it in that form—adjusted as to price. Now, when is the adjustment as to price to be made upon the remaining amount of oil that was to be furnished under the contract in 1904 as to the contract of 1905?

—. There will be no adjustment of that kind made.

Q. Then I am to undersand that the company foregoes the benefit of the cheaper contract and the deliveries that are to be made under that entirely?

1701 A. Because they were obliged to cancel the contracts whether they wanted to or not.

Q. Will you answer that question yes or no. I think it is capable of such an answer.

Mr. Mathewson: The witness is entitled to answer it in any reasonable way.

A. They did forego for the reason I have stated, because they were obliged to cancel the contract.

Q. Why were they obliged to cancel the contract?

A. Because they were obliged to substitute another oil for that for which they were under contract.

Q. I call your attention to the fact that the two contracts call for exactly the same grade of oil, but in different quantities.

Mr. Mathewson: Proportions.

A. Under the contract we would not have been able to get the oil of higher grade which we required for the Winter of 1905 and 1906.

Q. That may be, but you mean by that that the 25 per cent. of the 177,000,000 of 34 degree Baumé had been exhausted; is that it?

A. It was not exhausted. There was not a balance sufficient to carry us through the Winter.

Q. And there was sufficient still remaining of the 28 degrees Beaume, wasn't there?

A. You could not cancel the contract in part.

Q. No, but if you had used up the quantity of oil which was to be delivered at 34 degrees you could make a new contract for 34 degrees without foregoing the contract for 28 degrees, could you not?

A. I think not.

Q. In order that we may close up this particular instance, will you be prepared with that date after recess?

A. After recess? Well, I do not like to undertake to do 1702 things on short notice. I would not like to present that here without some opportunity to confirm it and examine it, and understand what they are giving me.

Q. All I want is those entries from the books.

A. I know what you want, Senator.

Q. Do you recall whether the accounts were kept separately as to the deliveries of 34 degrees Beaume and 28 degrees Beaume? They were, were they not?

A. I do not know.

Q. I call your attention to page 1014 of this record, where you make this statement:

"Referring to page 262 of City's Exhibit 34 for identification, calling for 102 million gallons of 34 degree oil and above. The record indicates the date of deliveries, the point of deliveries, the gallons as per invoice, the barge number in which delivery was made, and the amount of the bill and the gallons as per the company's measurement."

Does that refresh your recollection as to how that book was kept?

A. It very plainly indicates how the record was kept; I have no doubt it is correctly stated there.

Q. On page 1026 of the record:

"Q. At the top of this column, 'Contract,' appear the words and figures '135,000,000 gallons, 28 and below.' What does that mean? A. 28 degrees of specific gravity and below.

Q. Does that refer to a contract for 153,000,000 gallons of that kind of oil? A. It refers to a contract of 255,000,000 gallons of 28 degrees and 34 degrees."

Now, taking the 153 million gallons at page 1026 of 28 degree Beaume and the 102 million gallons referred to on page 1014 1703 for 34 degree Beaume, adding those together, we have 255 million gallons, do we not?

A. We do.

Q. Now, does that refresh your recollection as to whether the accounts were kept separately as to the different degrees of oil?

A. Your question did not refer to this contract that we are talking about now at all. It referred to the previous contract, and I stated I did not know whether the previous contract was similarly recorded or not.

Q. You do not know whether in this particular you have changed your method of bookkeeping or not?

A. No bookkeeping involved in it whatever; merely a record of deliveries.

Q. Made upon the books of the company. That is all any bookkeeping is, is it not, a record of transactions made upon the books of the company?

A. The dictionaries so describe bookkeeping, I think.

Q. It would be a very easy matter, when you open that book, to tell?

A. Very simple indeed.

Q. Well, if it is kept separately, will you bring it?

A. We are losing a lot of time about it.

The Master: It seems to me that there has been an enormous amount of time lost over it. Why cannot we send up and get the book and have it brought down here, and have it out, instead of prying out these questions? The book shows what it is, I suppose. Why don't you get it, Mr. Mathewson?

Mr. Mathewson: I am perfectly willing, but the book was not asked for. We were asked for a statement and I said it would be produced.

The Witness: It can be produced.

Mr. Page: Very well; let us have the books produced this afternoon. I suppose it is time to adjourn. I thought I was saving time and meeting the convenience of the complainant. If I have wasted the time of the Court, I am sorry.

Here a recess was taken until 2 o'clock P. M.

1704 After Recess.

Robert A. Carter continued.

By Mr. Page:

Q. Mr. Carter, have you produced the book that contains the account of oil delivered under the contract of 1904?

A. Yes, sir.

Q. Will you turn to the beginning of that account. Do you find that that account is divided into oils delivered at 34 degree Beaumé, and 28 degree Beaumé?

A. The contract of July 1st, 1904, is divided.

Q. Now will you start with the beginning of that account at the 34 degree Beaumé.

The Master: Is this book marked for identification?

Mr. Page: Yes, it is Exhibit 34 for identification.

(Witness produces City's Exhibit 34, for identification.)

Q. That is not it; that begins with September.

A. Those are the first deliveries under that contract.

Q. The first deliveries made under the contract, City's Exhibit 10, which by its terms went into effect the 1st of July, 1904, were made when, Mr. Carter?

A. September 28th, 1904.

Q. And the testimony already given gives the entire amount of oil that was delivered under that contract up to the 31st of October, 1905, does it?

A. 31st of October, 1905.

Q. And the oil that was delivered from the 1st of July, 1904, to the 28th of September, was delivered under the previous contract, is that right?

A. Yes, sir.

Q. Does that also hold good as to the 28 degree Beaumé as 1705 well as the 34 degree, under the contract, City's Exhibit 10?

A. The deliveries to which you have just been referring, appearing on page 229, commencing on September 28, 1904, were under the contract of July 1st, 1904, and were of the 28 degree oil.

Q. Well you can finish now about the 34 degree oil, whether that commenced at that time or not?

A. The deliveries that were made of 34 degree oil under the contract taking effect July 1st, 1904, began in March, 1905.

Q. And the amount of 34 degree Beaumé oil delivered under that contract was 7,257,982 gallons.

A. Yes, sir, that is right.

Q. And that contract called, did it not, for the delivery of 44,250,000 gallons? I think it is stated at the head of page 260, isn't it?

A. 44,250,000 gallons.

Q. On the 31st of October, when this new contract was made, the entire amount of oil that had been delivered on the contract Exhibit 10 was 82,061,615 gallons of 28 degree?

A. 82,061,124 gallons.

Q. Of 28 degree and 7,257,982 gallons of 34 degree Beaumé oil?

A. That appears to be the case.

Q. Leaving due the company on that contract on the 1st of November, 1905, 50,000,000 gallons and over of the 28 degree and 37,000,000 gallons of the 34 degree, is that right?

A. 37,000,000 gallons of the 34 degree, of which, however, we could only get 25 per cent. at any time of the total delivery.

Q. What do you mean by that?

A. Well, my recollection of the contract of July 1st, 1904, is that it stipulated that we should take 25 per cent. of the high grade oil, but not that we could take all of that during the few winter months.

Q. I hand you contract Exhibit 10 and ask you to read it over so you may correct your testimony if you wish to?

1706 A. It says here that "this material is to be taken currently."

Q. "As the same may be required of you," that is, the Consolidated Gas Company.

A. My understanding was that we were to take it currently as we required it, of course, both oils; but they were to be taken currently, both oils, as we required them, not one oil in the summer and the other in the winter.

Q. The contract speaks for itself on that?

A. Very plainly.

Q. Did you during the recess refresh your recollection as to how much the actual amount of this rebate or allowance under this old contract amounted to?

A. Yes, $119,000 in round figures.

Q. Instead of $112,000, as I stated; it was my mistake, I misled you.

Mr. MATHEWSON: I thought your figure was too high.

Mr. PAGE: Well, it was too low by $7,000.

The WITNESS: It was $119,000. Not for the Consolidated Gas Company, however, all of it.

Q. Oh, no. Now, having the book with you, can you give us the prices which were charged in that contract that was abrogated by Exhibit 10?

A. The contract abrogated by Exhibit 10 called for oil at one price only, four and three-quarter cents per gallon. I think I testified from memory this morning that it was four and three-eighths.

Q. Yes.

A. I was wrong. It was four and three-quarters.

Q. Can you state from Exhibit 34 for identification how much oil was furnished after the abrogation of the contract calling for oil at four and three-quarter cents which was rebated or allowed for in the $119,000?

1707 A. I am not able to state that just positively from this record. The record shows the deliveries of oil under the contract referred to from June 1st, 1904, to September 28th, 1904.

Q. Could not you arrive at it in this manner; the new contract went into effect on the 1st day of July, 1904. You have testified that the first deliveries were made under that contract, and charged under the new contract on the 28th of September, and the deliveries made between July 1st and September 28th would be under the old contract, would they not?

A. On that assumption which——

Q. Well, if the assumption is not correct we do not want to make it.

A. Well, my memory is not very fresh on the subject. I might see how it figures out. The deliveries from July 1st, 1904, to September 28th, 1904, according to this record, amounted to 13,221,784 gallons, and the difference between the price in that contract, 4¾ cents, and the price for low grade oil under the contract that went into effect July 1st, 1904, .71 of a cent, would not indicate a sum approximately $119,000, which was the amount received in adjustment of the prices. It would be something less than that.

Q. Would it be considerably less?

A. Yes. $25,000 less. If you take the oil that was delivered from June 1st, 1904, to September 28th, 1904, 7,780,399 gallons at .71 of a cent, you would get in round figures $125,000. The inference is that between June 1st and the 30th was the point at which this allowance began.

Q. There was some calculation made at the time was there not?

A. Unquestionably. There is no doubt that we received the full amount that we were entitled to.

Q. Is there some communication or other record that is now in the possession of the company showing how that computation was made exactly?

A. No, none that I am able to find. Unquestionably there were memoranda made of it at the time, and the correctness of
1708 the final adjustment established.

Q. Now, when that cash was received—the rebate was paid in cash, wasn't it?

A. Yes.

Q. When that was received, how was it treated on the books of the company, where was it entered?

A. In our cash account.

Q. And then how was it journalized, into what account was it posted?

A. To the credit of suspense account, if my recollection serves me; Mr. Cuthbert went over it; he can probably confirm my recollection.

Q. But you objected to Mr. Cuthbert taking a copy of it, didn't you?

A. I did.

Mr. Mathewson: Is that worth while putting on the record?

Mr. Gans: I think it is decidedly. I think it is well for the record to show what limitations were put upon our examination of the books.

Mr. Mathewson: There is no objection to your examining books, but we do not want anybody to lug off copies of our books.

Q. Where do you carry the Standard Oil account, in what ledger?

A. Our current account with the Standard Oil Company?

Q. Yes.

A. In the sundry creditors ledger.

Q. You mean, then, in the journal that this account would be credited to the Standard Oil account and charged against cash or charged against suspense account?

A. The question is not very clear, Senator.

Q. Well, in order to transfer this money or the credit for it to the Standard Oil Company, you would have to put it through the journal in some way.

A. To the credit of the Standard Oil Company?

Q. Yes.

A. The credit to the Standard Oil Company would be on
1709 account of the settlement by them of the amount due.

Q. I understand that, but I am trying to get at the bookkeeping method of dealing with it?

A. I am trying to explain that.

Q. I thought you had finished?

A. The amount that was due from the Standard Oil Company under this adjustment of prices was a charge against them in the sundry debtor ledger. The payment by them of the cash operated to balance the account.

Q. You said you carried it as an suspense account. I want to know how you got at that then?

A. We charged the suspense account and credited the stock account, the material account, with the amount of this adjustment; and when the charge was made against the Standard Oil Company in the sundry debtor ledger, the credit was to the suspense account, thereby balancing the amount with which the suspense account had been charged.

Q. Then subsequently in some way I suppose the credit was distributed to the subsidiary companies and the Consolidated Gas Company in its proportionate amounts, is that so?

A. That is the case, yes, sir.

Q. Did this item appear on the regular account of the Standard Oil Company in the sundry creditors ledger?

A. No, it did not. In this case they owed us money whereas their account in the sundry creditors ledger indicates the amount of our obligation to them.

Q. Then you opened a special account for this purpose, did you?

A. In the sundry debtors ledger, where it properly belonged.

Q. Where was the suspense account that you referred to entered? In what particular book was that?

A. The suspense account is one of the accounts in the operating ledger.

Q. And are there other items besides this?

1710 A. A great many items besides that in the suspense account.

Q. Now, referring to Exhibit 94, the item of expense, $339,999.51, did that include in addition to the ordinary and usual expenses of the company some extraordinary expense for legislative investigation?

Mr. Mathewson: He asked if it was an extraordinary expense, Mr. Carter.

A. There were included in that item certain expenses in connection with the legislative investigation.

Q. And they amounted to $77,806.76, did they?

A. No, sir; not in this particular Exhibit 94.

Q. How much of it appeared in Exhibit 94?

A. $21,910.63, according to the statement before me which I have not checked, and therefore am not prepared to say that it is absolutely correct.

Q. Now, that $55,896.13 was distributed to certain other accounts, was it?

A. You are questioning me, Senator, from a document that of course I am unfamiliar with. I know that we did take out of the general office expense account such legal expense as had been carried in there during the year and charged it to the legal expense account.

Q. And this $55,896.13 would appear then in "Advertising and Legal," $105,800.02?

A. Yes, sir, that is where it would appear.

By Mr. Mathewson:

Q. Wasn't that "Advertising and Legal" a regular every day account that goes on every day, year after year?

A. Yes, sir.

By Mr. **Page**:

1711 Q. But that account was increased by extraordinary expense of legislative investigation to the extent of $55,896.13?

A. I am not sure that that is the case and that all of that $55,896.13 was a charge against our legal expense account.

Q. Well, all of that charge was distributed somewhere in the account that appears on Exhibit 94, wasn't it?

A. That I am not sure of because it may be that we billed some other company for some of it.

Q. Well, do you know whether you did or not?

A. Well, I do not from memory recall. That is the reason I do not want to be positive about it and say that all of that $55,896.13 was distributed among our other operating accounts. It may have been and it may be something less than that was so distributed. I want to be somewhat conservative in my testimony.

Mr. **Mathewson**: Wouldn't it be well, Senator, to have it appear on the record that you are questioning the witness from these papers which are notes made by your accountants?

Mr. **Page**: If you wish it so, it may appear.

Mr. **Mathewson**: Merely to show what Mr. Carter means when he says he is not familiar with the documents.

The witness now produces a number of papers and hands them to Mr. Gans.

Mr. **Mathewson**: State what these papers are which you have produced.

The **Witness**: They are statements of station expenses by months for the year 1905.

By Mr. **Burr**:

Q. For the calendar year?

A. For the calendar year.

1712 By Mr. **Mathewson**:

Q. Each station?

A. Each station for each month, and each month aggregated as to all expenses.

By Mr. **Burr**:

Q. Manufacturing expenses?

A. Manufacturing expenses.

By the **Master**:

Q. How many sheets do you produce?

A. There are 83 sheets.

Mr. **Gans**: I ask to have them marked for identification.

The 83 sheets of paper are marked as one Exhibit, State's Exhibit T for identification.

Mr. **Gans**: The witness also produces tax receipts for the year 1905, consisting of 8 sheets from the Department of Finance of the

City of New York; and one from the Borough of Edgewater, Bergen County, New Jersey. I ask to have those marked for identification.

The nine sheets of paper are marked as one exhibit, State's Exhibit for identification, Exhibit U.

By Mr. **Gans**:

Q. These 83 sheets comprising State's Exhibit T for identification, are they part of the original records of the company or are they accounts which you have had made from the original records?

A. They are copies of original records, made from original records. They are statements of the operations of the different stations for the stated months.

1713 Q. Are they copies you have had made since I asked you for this data?

A. They are not. They are carbon copies of this data originally furnished. I usually have two copies made of everything of that sort.

Q. So what was required to comply with my request was to get these from the files of the company?

A. That is the case.

Q. Now in order to prepare what I asked for at the same time, namely an exhibit corresponding with the former exhibit 145 before the State Gas Commission, all that will be necessary would be to take the aggregate of these eighty-three statements, would it not?

A. Such a statement would of course be the aggregate of those statements.

Q. And that is all that is required to prepare such a statement, is it not?

A. That is all. There is some other information, I think, in exhibit 145 before the Gas Commission, that perhaps does not appear in those statements.

Q. Do you remember what that is?

A. No, from memory I cannot say. There is one item that I recall I think in exhibit 145 before the Gas Commission which would show gas made for the Consolidated Gas Company by the other companies, which does not appear there.

Q. That is an aggregate for the year, is it not?

A. I might save time by saying that a statement corresponding to that exhibit 145 before the Gas Commission for the calendar year 1905 is now in course of preparation.

By Mr. **Mathewson**:

Q. Would not that contain all the information that is on the State's Exhibit T for identification?

1714 A. It will, the aggregate for the year; it appearing there in monthly figures and would also contain some things that do not appear there, which were enumerated; one, the gas manufactured for us by other companies, under the agency agreements, and more detailed as to the sundry supplies used, and as to cartage; and Exhibit 145 includes the distributing expenses which do not appear in State's Exhibit T for identification at all.

Mr. Gans: I think we will save time and prevent encumbering the record unnecessarily if I can be permitted to take these Exhibits for identification and look them over and determine how much of them I want.

Mr. Page: You would want to wait, would you not, until this Exhibit which will compare with Exhibit 145 before the Gas Commission is prepared.

Mr. Gans: It will save time if I can take the two things up together.

A further colloquy now ensues between counsel and the Master, which the stenographer is directed not to report.

Q. These tax bills which you brought down, marked State's Exhibit U for identification, represent an amount equal to that appearing on State's Exhibit E opposite the words "real estate"?

A. It should correspond very closely.

Q. Exactly, should it not, unless some mistake has been made?

A. I think they would probably agree within a negligible amount. Of course the amount that is charged in the way of expenses is intended to correspond exactly, and to a penny, with the amount of the tax bills, but there may be a slight variation.

Q. The amount appearing on State's Exhibit E as real estate taxes, being $179,788.95, is the amount of the face of the tax bills rendered by the City of New York for taxes on real estate during that period?

A. That is the case.

1715 Q. And that is somewhat more than the amount actually paid by the company for real estate taxes, is it not, there being a discount?

A. There was a discount, I think, of something like $1,700, which went to the credit of our discount account, which appears in our miscellaneous income account.

By Mr. Mathewson:

Q. In Exhibit 94?

A. In Exhibit 94?

By Mr. Gans:

Q. It does not appear under that name in Exhibit No. 96, does it, as a discount allowed on a real estate tax?

A. Not separately stated; included in the discounts.

Q. It is covered in that general item?

A. General item of discounts.

Q. And one could not discover it unless one made some inquiry in regard to the details of the item? That is not intended as a reflection on anybody, but as a question.

A. I think the statement answers that question.

Q. That is true, is it not?

A. Of course it is true.

Q. The amount of that discount is to be found upon these tax bills, in these amounts in red ink, being State's Exhibit U for identification; is that right?

A. That is quite right.

Q. So if you will add these you will get the precise figures?

Mr. **Mathewson**: Why not add the discounts which are also in red ink, and you can tell at once.

Mr. **Gans**: It is the discounts I was going to add. I have accepted the other figures as being approximately correct.

1716 Q. The exact amount of that discount is $1,702.22; is that right?

A. I already gave you the figure of $1,700, and I have no doubt that $1,702.22 is correct.

Mr. **Gans**: I offer these bills in evidence.

(The tax bills, being State's Exhibit U for identification, were now received in evidence as State's Exhibit U and so marked.)

Q. Am I right, that you have not included in your statement of the amounts paid for taxes on real estate the amount paid on the Edgewater property?

A. The $870 paid on the Edgewater property seems to have been omitted from State's Exhibit E.

Q. Would that amount mean also that it has not been included in the total in Exhibit 94?

A. It would so appear.

Mr. **Mathewson**: Does that end your cross-examination, Mr. Gans?

Mr. **Gans**: I do not wish by saying that it will close my cross-examination—from being precluded if something develops in the testimony.

Mr. **Mathewson**: I mean, as far as you now foresee.

Mr. **Gans**: The matters I mentioned a few moments ago are all I can think of at present.

Recross-examination by Mr. **Burr**:

Q. Can you give me any explanation of the differences in cost per thousand feet of gas made at the various stations, as they appear here on State's Exhibit T for identification, the rate on 44th Street, being 29.34 and for 14th Street 36.29.

Mr. **Mathewson**: For the same month?

Mr. **Burr**: For the same month.

1717 A. I would not like to do so without making a detailed comparison of the expenses at the two stations and ascertaining just exactly what the difference was.

Q. I understood you to say that these eighty-three pages contain the cost of labor and material only at each station; is that right?

A. They contain such items of station cost as are enumerated on the statement.

Q. Your attention has been called to Exhibit 105, which was offered in evidence this morning, purporting to be a statement of gas made for the Consolidated Gas Company by other companies, net, for the nominal year ending October 31st, 1905. In that statement there is a variation in the purported cost of gas each month. The month of the greatest cost for the New Amsterdam Gas Company appears to be July and the cost is 39.66, the Standard for July, 35.31; the Mutual for January, 41.60; the Central Union, October, 44.43. The month of least cost of the New Amsterdam is December, 31.85; the Standard, May, 31.65; the Mutual, October, 34.95; the Central Union, June, 25.85. Can you explain those fluctuations in cost?

A. I could not do so without very carefully analyzing the figures. Offhand I should say that possibly the fact of a considerable amount of repairing occurring within a given month would operate to augment the cost for that particular month; possibly some other conditions might be abnormal in a given month, or unusual, and it would require very careful analysis of the figures to state just what contributed to that variation.

Q. Will you make such analysis?

A. I should be sorry to do so. I have not undertaken to do so.

1718 Q. Can you explain the fact that the increased percentage of the highest cost over the lowest is as follows:

The New Amsterdam	24%
The Standard	11½%
The Mutual	19%
The Central Union	33%

Can you give any explanation of the variation in that regard?

A. Only in a most general way. With respect to the Central Union Company, their cost in the latter part of 1905 was very much higher than in the first part of the year because of the candle power requirement under the law that went into effect July 1st, 1905.

Q. Are you merely assuming this?

A. I know it to be the case. They testified to it themselves before the Gas Commission.

Q. In regard to which company?

A. The Central Union.

Q. Is that all the explanation you can make with regard to this variation that I have called your attention to?

A. All I should care to make offhand.

Mr. Mathewson: There might be a large replacement in one month which goes to the operating expense.

Mr. Burr: I know; it might be a thousand and one things.

Mr. Mathewson: Yes, but you asked which particular thing it was that month. We would have to go over all the detail and pick it out.

Mr. Burr: It appears from this statement which has been offered in evidence that the amount of gas or the season of the year makes no difference with regard to this variation in the price or cost of production.

Mr. Mathewson: Quite so; a big replacement or repair might be controlling.

1719 Q. Can you tell now the amount of gas used by the Consolidated Gas Company last year for its own purposes?

A. No.

Q. Can you tell me now the total capacity of each of the subsidiary companies?
A. I cannot.

Mr. **Mathewson**: That is on the record, Mr. Burr, the capacity. What do you mean by subsidiary companies?
Mr. **Burr**: The subsidiary companies.
Mr. **Gans**: Those operating under the agency agreement.
Mr. **Burr**: Yes.
Mr. **Mathewson**: Oh, I did not know that they were so subsidiary as that.
Mr. **Burr**: We have constituent companies and subsidiary companies, and we have been so designating them throughout the course of this examination. If I had that information which I called for, we might be able to proceed on that line.

Q. Did you produce the policies of insurance?
A. I have not even considered the printed requests. I only got a copy of it a few moments ago, and certainly I should expect counsel to consider them before I undertook to furnish them.

The **Master**: How do we stand? Has anybody finished with the cross-examination of this witness, or is everybody supposed to be in a state of suspense?
Mr. **Burr**: I would like, for my own information, so far as I am concerned, to know from Mr. Carter or Mr. Mathewson, to-morrow, whether the information which I have called for is to be produced or whether in the estimation of Mr. Carter, it has already been
1720 produced. If that information is produced, I may or may not have some further cross-examination.
Mr. **Page**: I think it is safer to charge us all up with a suspense account.
Mr. **Mathewson**: You will remember Mr. Burr, that Mr. Bradley was examined on the capacities of the plants of the other companies of the Consolidated Gas Company and testified in detail on that subject, so that it is all on the record, every particle of it. Don't you recall it?
Mr. **Burr**: The capacity of the subsidiary companies?
Mr. **Mathewson**: Certainly.
Mr. **Gans**: His testimony was 62,000,000 feet a day.
Mr. **Mathewson**: No, there was an error of 2,000,000 feet there, so it made 60,000,000 and a fraction.
Mr. **Gans**: Shall we adjourn now?
Mr. **Mathewson**: Let us see if there is not some line apart from these statements that we can examine the witness on. If there are any general lines, I suggest we proceed.
Mr. **Gans**: If we adjourn I can put in the time to some good purpose by looking over these things and disposing of them.
The **Master**: Is it not possible to get some idea of what we can do hereafter? For instance, if Mr. Carter is to be on the stand all day to-morrow and further statements are to be called for, we ought to know it now.
Mr. **Page**: I did not suppose Mr. Carter was to be brought on the

stand until he got all this information, so that at the next hearing we could end it.

Mr. **Mathewson**: But new information is asked for, including this statement Exhibit 145.

1721 Mr. **Gans**: I don't think that is new. We spoke of that a long time ago.

Mr. **Burr**: I think the suggestion a very good one. If you could see your way clear, he might be busy getting out these statements, and be called as the last witness, and when the statements are produced we may have no questions to ask him, or we may desire to ask him some further questions.

Mr. **Mathewson**: Have you any line of cross-examination except that which is dependent on these statements which you have asked for?

Mr. **Burr**: No, I think not.

Mr. **Mathewson**: Well, this being the case, Mr. Master, rather than lose precious time I will go on and examine Mr. Carter myself to some extent on the redirect, unless you wish to adjourn at the present moment.

The **Master**: I am entirely satisfied to adjourn at the present moment, and do not want to force you on with the redirect unless you wish to do it. I was talking about to-morrow, whether we could go on with some other witness to-morrow. I wanted to get an idea of what these gentlemen's plans are.

Mr. **Mathewson**: I would as soon do this, perhaps as to put on another witness to-morrow. It seems that we have practically concluded the general line of examination, only leaving these statements which when presented may give the information and require no cross-examination at all, and rather than adjourn now, I having no other witness here, I think I would rather examine Mr. Carter a little while, if the Master will permit it to be done out of order, so to speak, saving my own rights, or if the Master desires to adjourn now for any reason——

Mr. **Gans**: I would very much prefer to adjourn because I 1722 want to be able to look over these things.

The **Master**: I think you had better adjourn now, and you gentlemen had better be prepared to go on with the cross-examination tomorrow and finish it up.

Mr. **Page**: That we cannot do.

Mr. **Burr**: Unless Mr. Carter is prepared to furnish the information he is asked for.

Mr. **Kirby**: And we have to study these things.

The **Master**: Do counsel say that they cannot proceed with the cross-examination to-morrow?

Mr. **Page**: On exhibits that have not been produced and will not be produced until to-morrow morning, and on these eighty-three pages of exhibits that have been handed to us to-day, we state that it is a physical impossibility to prepare for cross-examination.

The **Master**: I think counsel are a little bit unreasonable, and not quite fair to the Master in that particular. First, these 83 pages of exhibit, the witness testified yesterday that they were in his desk and he has brought them down here and counsel has had several weeks during which this hearing was in progress, and if they wanted those 83 sheets constituting Exhibit T, it was perfectly competent for them to get them at any time. They had their expert there as I understand, as stated by counsel, until he got through and then he went away. No application was made to me for an order directing any books to be brought down, or any papers or anything else. It seems to me it is hardly fair for counsel to let a couple of weeks elapse when we are trying to speed this cause and then state 1723 that they are unable to conclude the cross-examination because they have not had an opportunity to study the case.

Mr. PAGE: There was no statement that we had not had an opportunity to study the case.

Mr. GANS: If the Master will permit me to call his attention to one thing which undoubtedly he has not realized. If you will turn to page 1000 of the testimony you will see that I asked at that stage, or at least tried to ask for precisely this exhibit, and by reason of the fact that I did not frame my question so as to cover technically the thing that Mr. Carter had, I was told that I was mistaken, and that there was no such record kept. And it was only yesterday morning that I discovered that there was a record kept such as I wanted. If you will turn to that part of the testimony you will find Mr. Burr in cross-examining said:

"Q. I call your attention again to the request which I made at the last hearing for a statement as to the cost of holders and so forth. Have you done anything in regard to that? A. No, sir, I have not done anything in connection with the preparation of it.

"Q. You have a statement at the office showing the amount of coal and oil consumed by each station, have you not, during the periods covered by Exhibits 93 and 94? A. Our engineering department records show the quantity of oil used daily, which are aggregated into monthly and yearly totals.

"Q. That would not be in your department, but the engineering department? A. The engineering department.

"Q. And that could be checked up by the accountant, could it not, if desired? A. Yes, very easily."

Then I asked him:

1724 "Q. You do receive monthly reports, including those items from the engineering department to the accounting department? A. No, we do not. As I have already testified, we simply have access to the engineering department records.

"Q. Am I mistaken in this; has it not been your habit to get from the engineering department a statement month by month of the cost of operation of each one of your plants, for the purpose of comparing that statement with a similar statement for the preceding year? A. No, sir.

"Q. Did you not so testify before the Commission? A. Never."

Now, the mistake I made was in suggesting they came from the engineering department. We had simply access to the engineering department.

"Q. Did you not so testify before the Commission? A. Never.

Mr. Mathewson: No, he testified that there were certain items, of course, which were compared, that he kept a record of certain items for the purposes of comparison, but nothing showing the comparisons of the total cost of gas at each station." Which should be, I assume, "each station."

Mr. Mathewson: Month by month, that is quite right.

Mr. Gans: That is precisely the thing we asked for and precisely what we now get. I do not accuse anybody of intending to mislead——

Mr. Mathewson: Exhibit 143 in evidence was the precise thing you asked for.

1725 Mr. Gans: Now this was some time ago. I didn't get it simply because I was not as well informed of the way this company's records were kept as Mr. Carter is himself and therefore did not ask for it in terms which made it impossible to answer categorically that they had no such thing, truthfully. He said they had not such a thing and I did not get it, as yesterday I stumbled by accident upon the method of asking the question which made it impossible for him to say that they did not have such a thing, and now I have got it. But I do not think that we should be charged with delay by reason of the fact that we did not get it until now.

Mr. Burr: I think it would be advisable, and would save considerable time, if the statements called for are presented when they are made, instead of waiting until weeks afterwards and then presenting them and then expecting a cross-examination to be made immediately upon them. For instance, a statement called for a week ago, instead of when it has been made, laying it up there, it should be produced and we could examine it.

The Master: Counsel for the various defendants seem to overlook the fact that a great deal of this work of the preparing statements is done for their accommodation. The position of counsel seems to be that the complainants are obtaining some favor by allowing the proof to go in in this manner. That is not as I understand it. My ruling was in reply to your objection, that you were entitled to have the books brought down here in certain instances for your cross-examination. Manifestly, if those books had been brought down here, judging by such experience as we have had, it would have taken you gentlemen months to get at the same amount of information that you got at by statements prepared in the complainants' office, which your experts, as I understand and as I ruled, were to have the opportunity to verify. 1726

Now, it seems to me, if for your convenience, the complainants set their clerical force at work making up statements and your experts have an opportunity to verify them, that you ought not to complain if the statements are not produced here with the rapidity that you like.

Mr. Burr: You will remember I called your attention, Mr. Master, some weeks ago, to the affidavit of Mr. Carter himself, in which he stated that the only time they had a fair chance to give all the information in regard to this company was in 1886. They complained of the dearth of information or opportunity which was afforded them before the Stevens Committee and the Gas Commission. And yet you see it has been like pulling teeth to get the information we desire from them. It is true we might have proceeded legally and asked for the books and it is true it would have taken much longer than 90 days to get that testimony, but we were within our strict legal rights when we asked for the original sources of information, and we only accepted these to facilitate the matter and save time.

Mr. PAGE: It seems to me that we are charged with a good many things that are not properly chargeable with. In the first place, if the orderly manner of proof that is followed in almost any court that I have had anything to do with, had been followed, it would have been necessary for this company to produce their books rather than put in evidence compilations from the books. The burden of consuming time in proving their case would have been upon them.

We made objections as to the form, and it was only admitted 1727 on the ground that we were to have an opportunity for verification. Now they have not produced copies of the books but compilations made from the books, and it has been necessary frequently to consume quite a good deal of time on cross-examination, in raveling out the entries they have made. We have been compelled to proceed here from day to day. Repeated applications have been made for adjournment, even for a day, to allow us to verify the statements that have been put in, while in each instance those applications have been denied. We have been forced——

The MASTER: I do not recall that.

Mr. PAGE: Unfortunately the stenographer did not take those applications upon the minutes, but nevertheless my recollection is very clear as to such having been made, both by myself and Mr. Gans. We have been compelled to go on here from day to day. Mr. Carter left the stand some two weeks ago, it is true. All the time that he has been off the stand has been consumed by from five to six hours a day in taking testimony, and most of the time in preparation for examination and cross-examination of the expert witness they had on the stand. I do not feel that the defendants in this case are properly chargeable with any delay and I do feel that the defendants have been put at a most tremendous disadvantage in the trial of this case, and in the manner in which they have been compelled to proceed.

Mr. BURR: What time will we go on to-morrow?

Mr. MATHEWSON: Do I understand then that we cannot depend upon any cross-examination to-morrow forenoon?

Mr. BURR: Do we understand that we cannot depend upon 1728 any information to be supplied by you?

The MASTER: The Court will be in session to-morrow and there is a witness on the stand for cross-examination. If counsel cannot proceed, we will make the proper entry on the record.

Mr. PAGE: I think we have made an application and a suggestion that we would like to have the cross-examination suspended until the statements that have been called for are produced and we have had a reasonable opportunity to examine them. I would make such an application.

Mr. **Burr**: Yes, and I make the same application. We certainly cannot go on with the cross-examination until we get the information we have called for.

The **Master**: We will cross that bridge when we come to it to-morrow morning.

Mr. **Page**: I think we have reached it now and I would like to know what we are to do to-morrow if I can.

The **Master**: Well, Senator, I do not wish to seem to be crowding counsel at all but my directions are very explicit in this *letter*, and as I say, some of this information you have had within your power for two weeks to get at if it was very pressing, and if this was trial in any equity term, the Court would sit from day to day and gentlemen would have to prepare for cross-examination either over night or Saturdays and Sundays or some other time.

Mr. **Page**: And that brings up another suggestion, that if this had been a case that had been brought up at an equity term or in Special Terms, counsel would have had some opportunity to prepare
their case for trial before they were forced on to trial,
1729 & 1730 whereas here we were forced right into trial almost as
soon as the issue was joined. I have tried a case
nearly for two and one half months sitting from nine o'clock in the morning to six o'clock at night, but I was able to prepare that case because I had six months in which to do it.

The **Master**: You must not visit the sins of the equity rules adopted in eighteen hundred and thirty something, or whatever it was, on my head. This is equity practice and the direction to speed the cause comes from a higher source.

Mr. **Page**: Yes, I know, and I think in the desire to speed the case the interests of the State of New York and the City of New York have been lost sight of.

Adjourned to 11.30 to-morrow morning.

Last Exhibits:

Complainant's 223.
State's U.
City's 44.

1731 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

Met pursuant to adjournment.

New York, Thursday, *September* 6, 1906—11:30 a. m.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Burr, Mr. Gans.

1732 Robert A. Carter resumed the stand and testified as follows:

Mr. Mathewson: Counsel not being ready to proceed with the further cross-examination of Mr. Carter, I will ask him a question or two.

By Mr. Mathewson:

Q. Have you prepared a statement separating the items of miscellaneous income for the calendar year 1905 and the nominal year ending October 31, 1905?
A. I have done so, yes sir, as shown in full in Exhibits 95 and 96.
Q. And is this the paper?
A. That is the paper, yes, sir.

Mr. Mathewson: I offer it in evidence.
Mr. Gans: Same objection that we have made to the offer of all papers; that is, that if we may be permitted to verify it by the books later we are perfectly willing to have the statement go in now.
Mr. Mathewson: This is part of Exhibit 96. The items are on Exhibit 96, which your experts have already verified.
Mr. Gans: In its present form it is objected to as incompetent, immaterial and irrelevant.
Objection overruled.
Exception.
Received in evidence and marked Complainant's Exhibit No. 224.

Q. Will you state how much interest has accrued, computed at five per cent., on the moneys advanced to the Astoria Company for construction by the Consolidated Gas Company?

Mr. Gans: That is objected to as immaterial.
Question allowed.
1733 Exception.
Mr. Mathewson: It is claimed by my opponents that the

interest upon the construction of the Astoria plant should be added to construction instead of being charged against operating expenses. I am now showing how much interest has already accrued upon construction, which would go to increase the value of the plant if that method of calculation is pursued; the same as interest at five per cent. was testified to by Mr. Mayer as necessary in the construction of a plant.

A. The interest accrued to August 31, 1906, inclusive, amounted to $1,081,711.44.

Q. That is computed at five per cent. on the advances to Astoria, whether they are evidenced by the stock, the bonds or the notes of the Astoria Company held by the Consolidated?

A. That is the case; yes, sir.

Mr. **Mathewson**: That is all now.

The **Master**: Do you intend to suspend the further examination of Mr. Carter?

Mr. **Mathewson**: I will withdraw him temporarily.

Mr. **Burr**: Before you do that I have a question I should like to ask.

By Mr. **Burr**:

Q. With regard to Exhibit 89, is that exhibit intended to show the investment of the Consolidated Gas Company in securities—— I have mislaid the exact exhibit number for a moment, but it is the exhibit which is in evidence here which purports to show the investment of the Consolidated Gas Company in the securities of 1734 other companies. Does that show the investment of the company in all kinds of securities, notes included?

Mr. **Mathewson**: I do not think the witness can reply until you point it out to him?

Mr. **Burr**: It is State's Exhibit B, page 382-A of the exhibits.

Q. You have the exhibit now in your hand. Will you tell me whether that statement embraces all notes of other companies held by the Consolidated Gas Company, as well as all stocks and securities of every description?

A. No, sir, it does not.

Q. Where does that appear?

A. It would appear in the trial balance of October 31st, 1905, of which you have a copy; also in the balance sheet of December 31st, 1905, both of which have been offered in evidence.

Mr. **Mathewson**: I am ready to proceed with the redirect-examination, but it is not convenient to do so until the cross-examination has been completed, and under the circumstances I shall put another witness on the stand, withdrawing Mr. Carter.

The **Master**: Note on the record that the other counsel state they are not ready to proceed with the cross-examination this morning.

Mr. **Gans**: Note that one of the reasons why counsel say they are not ready to proceed, and one of the reasons why they are not ready to proceed, is that one of the exhibits called for for the purpose of cross-examination has not been produced, that another exhibit of 83 pages, which was handed to counsel for the defendant yesterday, is of such volume that it makes it impossible to proceed with the cross-examination until opportunity has been had to inspect it; that the delay in procuring that exhibit, as was pointed out yesterday, 1735 was due to the fact that a misleading answer was given by the witness to a question some two or three weeks ago.

Mr. **Mathewson**: That is a nasty and uncalled for intimation. It is not true, and it should not have been made.

Mr. **Gans**: Well, it is true.

Mr. **Mathewson**: It is not true. It is absolutely untrue.

The **Master**: Well, never mind, gentlemen.

Mr. **Mathewson**: I want to say, if the Master please, right here, that I had not intended to make any issue of this, but that exhibit which we are called upon to produce for the calendar year of 1905, corresponding to the nominal year of 1905, has for the nominal year been before counsel ever since this hearing began, in the printed record, and if we had been requested to produce it or make it up for the calendar year weeks ago, it could have been done. The delay in requesting it was not attributable to us.

Mr. **Gans**: I did not mention the delay in that, but I will say in reply to that, that a request was made, if not on the record, then to Mr. Mathewson and to Mr. Carter off the record, for that particular exhibit.

Mr. **Mathewson**: I think you are mistaken, Mr. Gans.

The **Master**: Well, there is no question before me now. You can proceed, as long as Mr. Mathewson is willing to take up another witness.

Mr. **Burr**: I understand Mr. Mathewson is going to take up with me later in the day the information which I asked for, and which was spread upon the record yesterday.

1736 A further colloquy now ensues between counsel, which the stenographer is requested not to report.

Walter R. Addicks, a witness called on behalf of complainant, being first duly sworn, testified as follows:

Direct examination by Mr. **Mathewson**:

Q. Where do you reside?

A. In New York City.

Q. Are you an officer of the complainant, the Consolidated Gas Company?

A. I am, sir.

Q. What office do you hold?

A. Vice-President.

Q. Are you the chief executive officer of the company at the present time?

A. Chief active one.

Q. The office of President is at present vacant, is it not?

A. It is.

Q. How long have you been an officer of the company?

A. March, 1903, if I recollect correctly.

Q. Are you a graduate of any collegiate or technical institution?

A. United States Naval Academy, Engineering Corps.

Q. What year?

A. 1882.

Q. How soon after your graduation in 1882 did you leave the navy?

A. I stayed in the service about a year and a half, and entered the service of the Pennsylvania Railroad, motive power department.

Q. In what corps at Annapolis were you graduated?

A. In the Engineer Corps.

Q. Will you state what your experience as an engineer was thereafter?

A. I, having entered the service of the Pennsylvania Railroad, was attached to the Motive Power Department for about four years, during which time I worked as draughtsman on car construction, locomotive construction, construction of boiler house, round 1737 house, valuation of certain portion of the Altoona plant, and made the surveys of all the shops and shop yards in the Pennsylvania Railroad system, east of Pittsburgh and Erie.

Q. Were you employed in designing motive power and car equipment, and the like?

A. Yes, sir.

Q. Did you subsequently go to Boston as engineer for any company?

A. I left the Pennsylvania Railroad Company and entered the service of the constructing company that was building the Bay State Gas Company of Boston, during which time I spent some three months in Chicago in the gas works.

Q. Were you engineer for this construction company?

A. Not at first.

Q. At any time?

A. Yes. Later I became engineer for that company, and became engineer of the gas company after the works were completed and had been started; the Bay State Gas Company of Massachusetts.

Q. Did you have any experience in the practical operation of a gas plant before that?

A. Yes. In Chicago I ran the gas generators and did all other work that was necessary in the gas works personally; took the regular watch night and day for a period of three months.

Q. What other gas companies or lighting companies have you been engineer with between the time you have last mentioned and the time you became an officer of the complainant company here?

A. I became in succession, more or less exact as to date, engineer of the Roxbury Gas Light Company, Dorchester Gas Light Company, South Boston Gas Light Company, the engineer of distribution of the Boston Gas Light Company, Superintendent of the North End station of the Boston Gas Light Company, Engineer of the Boston Gas Light Company, Chief Engineer finally of all the 1738 companies mentioned; also of Brookline Gas Light Company, and the Consulting Engineer for various works in connection with the New England Gas and Coke Company and the Massachusetts Pipe Line Gas Company. I have also been Consulting Engineer for other companies, large and small.

Q. How does the Boston Gas Light Company of which you were Chief Engineer stand as to size among the gas plants in New England?

A. It is the largest one in New England.

Q. That is a coal and water gas plant?

A. Well, the North End station was the largest individual plant and the company itself today is the largest company.

Q. These companies which you have mentioned, the Roxbury, Dorchester, etc., are what are known in Massachusetts as the Boston or "Metropolitan Group?"

A. Well, they were known formerly as the "Boston Group" and "Brookline Group," there being two groups, Jamaica Plains being included in the Brookline group. They now constitute the Consolidated Gas Company of Boston, with the exception of the New England Company.

Q. Are you a member of any engineering societies and have you held offices therein?

A. I have been and am a member of quite a number: the American Society, the Ohio Society, the Western Society, New England Society, of which I was formerly President, the Guild of Gas Managers, of which I was President, Society of Gas Lighting in New York City, and others; and also naval societies, quite a number of them, naval engineers and naval architects and so forth.

Q. Are you familiar with the manufacturing plants, holders and distributing system of the complainant, the Consolidated Gas Company of New York?

A. Yes, sir.

1739 Q. And with the prices of manufacture and distribution of gas generally?

A. Yes, sir.

Q. Both water and coal?

A. Yes, sir.

Q. Are you familiar with the requirements of the Act of the Legislature, the Act of the Legislature passed within the last year or two, limiting the pressure in mains of the company between two and one-half and one inch?

A. I am.

Q. I will ask you—based upon your knowledge as an engineer, and particularly in the gas business, whether it is possible in your judgment to observe those requirements and furnish your customers with gas in the City of New York?

Mr. Page: That is objected to as calling for a conclusion.

Mr. Burr: The same objection.

The Master: I will allow it.

Exception taken by Mr. Page and Mr. Burr.

A. My judgment is that it is practically impossible to conform to the requirements of that law as to pressure.

Q. Now, as to the provisions concerning sulphur and ammonia, in the same acts?

A. There is no difficulty in conforming with the requirements as to ammonia, nor do I foresee any. There is no difficulty at present in conforming with the sulphur requirement, but it restricts us somewhat to the character of coal we can use.

Q. Does it require the use of more expensive coal or less?

A. Apt to be more expensive. The coals which have a large amount of sulphur cannot be used and still maintain the 20 grains required by that law. That law is being modified in other parts of the world. It is the same as in Massachusetts, in so far as sulphur is concerned.

Q. The tendency under ordinary circumstances is to increase the cost of manufacture? 1740

A. No, I cannot say that in New York to-day. In view of the constantly increasing quantity in which poor coal will undoubtedly have to be used, it will tend to increase the cost of gas in future, but I cannot say that it will tend to increase the cost of gas to-day. When I say that, I say not materially, in the case of water gas.

Q. Has the complainant ever made tests of the amount of gas burned in the street lamps, the city contracts calling for three feet per hour, to determine whether more or less than that amount was being burned?

A. Yes, sir.

Q. What was the result of those tests?

A. In the Welsbach burners——

By Mr. GANS:

Q. Were those tests made by you individually?

A. No, under my direction.

Mr. GANS: Then we object on the ground that it is incompetent.

The MASTER: I will allow it.

Exception taken by Mr. Gans.

A. (Continuing:) In the Welsbach burners 3.77 cubic feet per hour, I should say. May I elaborate a little in the answer?

By Mr. MATHEWSON:

Q. Anything that you think is necessary to answer the question properly.

A. That was done by taking the street lights off various points and testing them as they stood. It is within the power of the lamp lighters to burn anywhere from 3 feet to 6, if I remember correctly, under 2.2 pressure, but the average that we took off was 3.77 in the condition in which we found them.

1741 Q. That was the average?

A. That was the average. The flat flame burners we tested also by taking one of the burners that were in use and testing it with the gas going through at various pressures. If I remember correctly, it is about 4½ or about 4.6 feet which passed through a burner which was adjusted to three feet. I would like to check my 4½ feet, if it is necessary.

Q. Were those tests made under your direction and general supervision?

A. They were made under my specific instructions for the purpose of determining this question.

Q. Who purchases the coal and oil, or under whose supervision is it purchased, used by the Consolidated Gas Company?

A. The contract was made by me on the question of oil. As to the coal contract, the bids are ordinarily asked for by another officer of the company and come under my supervision, and I submit them to the executive committee.

Q. Are bids sought in reference to the supply of coal?

A. Yes.

Q. From any responsible parties who you may think able to deliver it?

A. Or who have a quality of coal satisfactory in quantity.

Q. Assuming of course the quality of coal must govern?

A. Yes, sir.

Q. And is the purchase of this coal made at as low prices as you can obtain it?

A. Yes, under the conditions required.

Q. How as to the oil?

A. The oil likewise, sir.

Q. It is in evidence that a contract of the Standard Oil Company, which would have expired early in 1906 was superseded on November 1st, 1905, by another contract calling for 40 per cent. of 34 degree grade and 60 per cent. of 28 degree grade oil.

A. That is correct.

Q. Did you negotiate the contract?

A. I did.

1742 Q. Did you make any endeavors at that time to secure as low a rate as possible?

A. I did.

Q. Was the price which was finally covered by the contract the same which you sought to obtain at the outset?

A. It was not.

Mr. **Page**: Would it not be just as well to let the witness testify as to what he did?

Q. Go ahead and testify as to the circumstances under which that contract was made, and the necessity in your judgment which made such contract advisable at that time.

A. The matter arose by the engineer in chief stating to me that he could not meet the requirements of the new law, as to 22 candle power, with 28 gravity oil during the winter months. I therefore took up negotiations for supplying a lighter grade of oil during the winter months. Those negotiations resulted in the contract which I understand is in evidence, which specifically provides for a light grade of oil during the winter months and a heavy grade of oil during the summer months. It was necessary in that contract to pay for the heavier grade of oil 4.28 cents per gallon, I think, and for the light grade of oil, 4.78, I think, or thereabouts.

Mr. **Page**: 4.29 and 4.87½.

Mr. Mathewson: May I have the contract, Mr. Master, which I think you have?

(The contract is produced and handed to the witness.)

A. (Continuing:) Referring to the contract itself for oil, City's Exhibit No. 30, contract dated November 1, 1905, the price for 34 gravity is 4.875, and the price for 28 gravity is 4.29. This is a substantial advance, between 4 and 5 per cent., over the prior contract.
I will say that the percentage, it will be noted, can be varied
1743 from 40, 45 and 50 per cent. of 34 gravity oil. It was doubtful in my mind whether we could get through with 40 per cent. during the winter season, so that the other amounts are provided for, the object being on my part to get the lowest average price of oil for the entire year, which in this case I believe figures about 4.50 or 4.52, or something of that kind.

Q. The previous contract, City's Exhibit No. 10 called for what percentage of 34 degree oil?

A. May I refresh my memory?

Q. Certainly?

A. 25 per cent.

Q. And was it your judgment that that proportion would be insufficient to maintain the higher candle power during the winter?

A. Yes, sir.

Q. The question has been asked in previous testimony as to why this contract was made at this time, when the entire 177,000,000 gallons called for by City's Exhibit No. 10 has not been delivered?

A. It was for the reason that I have stated, on account of the requirement of 34 gravity oil during the winter months. It was necessary to have that gravity.

Q. But it is in evidence that 25 per cent. of the 177,000,000 would represent over 40,000,000 gallons, and less than 10,000,000 gallons of the 34 gravity had been delivered on November 1st.

A. Yes, I understand that.

Q. Now, what is the explanation?

A. The explanation is that the contract provides——

Q. Which contract?

A. That the contract of April 26th, 1904, requires that this oil should be delivered currently.

Q. What do I understand you to mean by that, that it should be delivered currently?

A. That we had the right to call for 25 per cent. of 34 grade and 75 per cent. of the heavier grade currently from time to time. If we did not exercise our option for the 25 per cent., and were
1744 able to use the low grade oil, it did not mean that we could call upon the Standard Oil Company for 25 per cent. in bulk at any time and then leave it to the Standard Oil Company to deliver the 34 grade all the time, for the whole year.

Q. That was your understanding of the contract?

A. Yes, sir.

Q. What position was taken by the Standard Oil Company in reference to that clause?

A. They took that position in regard to it.

Q. Did you take legal advice as to your view, to ascertain if it was correct?

A. I conferred with counsel in all these matters.

Q. And was it on that legal advice, or after it, that you made that contract of November 1st?

A. Yes, sir.

Q. The contract of November 1st, being City Exhibit No. 30, covers what period, and requires delivery of oil for what period?

A. June 30th, 1908, was the expiration of the contract.

Q. Two years and 8 months?

A. Two years from November 1st. Our option in regard to the quantity of 34 gravity must be given in April, I think, of any year.

Q. It has been suggested that you tell what occurred in connection with this contract. I would like to have you state what the price sought to be charged by the Standard Oil Company was, which you say you refused, and any other considerations which influenced you to make this contract of November 1st, Exhibit No. 30, at that time and for that period.

A. In the first place, we had to have 34 gravity oil. The price asked, as I remember it, was a half a cent more in advance.

Mr. Page: When you say the price asked, if you are going to give conversations, let us have with whom they were.

1745 The Witness: I am not going to give conversations, simply going to give the price asked.

Q. You are obliged to state in substance what was said, not in words.

Mr. Page: Whom he had any conversation with, and as near as he can recall what was said on each side.

The Witness: I will be perfectly willing to give it, but it will be very difficult for me to remember it.

Q. Simply in substance.

A. The contract was made with Mr. Higgins of the Standard Oil Company at the price and under the conditions that we put in the contract. During the period of negotiations I also had conversations with others, in connection with the question of the supplying of this quantity of oil during the winter months, and their ability to perform such a contract. There were two other gentlemen, I think, Mr. Tilford I think was one, and I have forgotten the name of the other official. I raised this question of the absolute necessity for having 34 gravity oil, and they expressed doubt as to the Standard Oil Company's ability to make such a contract and they took the matter under consideration. They finally said that they would make the contract, but that for the current year they could not agree absolutely to give the 40 per cent. They did not know whether it was possible for the Standard to do it and that is the reason that that provision appears in that part of the contract.

Q. What provision?

A. Why, in regard to 18,000,000 gallons.

Q. Just state it.

A. The result of that was that this paragraph was put in:

"In the event of your requirements, November 1st, 1905, to March

31st, 1906, being for a greater quantity of 34 gravity oil than 1746 18,000,000 gallons, we are to have the privilege of substituting for such excess oil of lower gravity than 34 degrees, but not lower than 28 degrees."

However, they did fulfill that portion of the contract.

Q. What was the amount which was first stated should be charged for oil under the new contract, or in connection with the new contract?

A. A half a cent higher than the current price, as I remember it.

Q. And the contract is made for a quarter of a cent advance?

A. A quarter of a cent, and the provisions in regard to winter and summer deliveries are specifically set forth in the contract.

Q. Was the subject of the price of oil in the future mentioned, or the probable price, and did that have any influence on your mind?

A. It was mentioned.

Q. State it?

A. My disposition was to take what 34 gravity we could at such price that we would have to pay, rather than make this contract at this time. They told me that the price of oil was advancing and that it was necessary for us to provide for our very large demand for 34 gravity oil, if we wanted it; that otherwise other contracts would be made with others and the supply might not be available for us.

Q. And as the result of these negotiations this contract, City's Exhibit No. 30 was made?

A. It was.

Q. I will ask you whether, considering the circumstances, in your best judgment, the making of that contract was a judicious business thing?

A. Unquestionably.

Q. If the Standard had refused to furnish 34 gravity oil under the previous contract during the winter months, on the construction that such a call would not be to furnish it currently, had you 1747 any other source from which you could procure the amount of oil required?

A. I know of none, sir.

Q. In reference to the purchase of material which is bought under your supervision, I want to ask you generally whether you make efforts to get the lowest prices possible?

A. Certainly.

Q. And are any purchases made which in your judgment are not necessary to the operation of the company?

A. No, sir, they are not.

Q. How as to wages and payments for labor, as far as you are familiar with them? That is, as to the number of men employed and the amount paid to them?

A. Every effort is made to make gas in the most economical manner both as to labor and material and as to the price paid for labor; whatever the ruling rate may be, or whatever may be absolutely necessary for us to pay, determined by the question of supply and demand.

Q. Mr. Bradley heretofore testified in reference to certain expenditures at Astoria and, without his figures, he said from recollection that the total estimate for the first unit at Astoria, including land and tunnel, was something over $13,000,000. Were those figures made up by him and you in conjunction, or were they made up in consultation with you?

A. They were made up by Mr. Bradley and I consulted Mr. Bradley in regard to them.

Q. In his absence, have you the figures here?

A. May I have Mr. Bradley's figures, Mr. Mathewson?

Q. Mr. Bradley had no figures with him, but he stated that his recollection was that the amount was about $13,100,000 as I recall it, possibly $13,096,000. Will you state what the exact total amount of the latest estimate is of the items regarding which Mr. Bradley was testifying?

A. This detailed estimate which includes real estate and
1748 tunnel amounts to $13,134,519.65, but it does not include certain other items which I have data in regard to.

Q. Mr. Bradley stated in his testimony that there were certain other items which were not included, some of which he mentioned. Will you state all the additional items beyond the amount which you have mentioned, which will or may be included in the first unit, with the estimate as to each as nearly as you have it?

A. These items aggregate the total of $2,582,500.

Q. Will you give them in detail?

A. As follows:

Coal storage bridge	$150,000
Foundations	80,000
Rope haulage system	45,000
Coke storage plant at Astoria	50,000
Scows and tugs for transporting of coke to New York with coke unloading and distributing station in New York City	500,000
By-product plant	300,000
Grading and filling	50,000
Switch yard to connect with the Long Island Railroad extension	70,000
Dwellings for company's employees	300,000
Stables, horses, harness and wagons	10,000
Steel work for the second holder in the tank under construction	700,000

Q. That is the 15,000,000 foot holder?

A. 15,000,000 cubic foot holder. Undistributed expenses, 10 per cent., on $2,255,000, $225,500; 10 per cent. on items one and two, undistributed expense not heretofore included, $102,000. Total, $2,582,500.

Q. Now the undistributed expense on Items One and Two refers to Items which were included in the $13,134,519.65 total, but upon which the items in course of construction had not been computed?

A. Items One and Two are the items of coal sheds and 60-inch

mains, being items aggregating $1,020,000 which were not
1749 included in the estimates prior to putting in the 10 per cent.
for undistributed expense, and therefore subject to an increase of 10 per cent.

Q. You mean before computing the 10 per cent., which entered into the $13,134,519.65?

A. Yes, and on the $9,321,783.66.

Q. On all other items on construction except these two items does the $13,134,519.65 which you have mentioned include the 10 per cent. engineering or undistributed expense as you understand it?

A. No, it does not. It does not include 10 per cent. on the real estate.

Q. That is not construction account?

A. I beg pardon, you used the sum $13,134,000, and I thought as long as that included the land, there would be a question about that.

Q. No, I said covering construction.

A. I think that is so. There are some additional items here which entered into construction, such as the cement for gas holder tanks, and overhead gas mains which did not appear in the original estimate. They were left out by error and they are in excess of the 10 per cent. They did not enter into the 10 per cent.

Q. These items for construction which you have specified which aggregate $2,582,500 and which are in addition to the $13,134,000, will you state which of those in your judgment will be required in connection with the first unit as distinguished from those which may be required, possibly?

A. Will you pardon me if I refresh my mind?

Q. Yes.

A. The item of scows and tugs for transporting coke, coke unloading and distributing station in New York will undoubtedly be required for the first unit.

Q. How much is that?

A. $500,000. The by-product plant, $300,000, there is a question about. It has always been included in the additional
1750 unit beyond 20,000,000, but it depends somewhat upon the
question whether we will be able to make a favorable contract for by-products.

Q. If not, you will have to have the plant?

A. If not, we will undoubtedly have to have a by-product plant to manufacture other products. The switch yard connecting the Long Island Railroad, I cannot be sure that we are going to have it immediately, but we are having the engineers of the Long Island Railroad or engineers recommended by them lay out our present yards to connect with such an extension. That will amount to $70,000. The dwellings for company's employees, $300,000, is a question which is a serious one. We undoubtedly will have to take care of the important employees of the company, but to what extent that $300,000 will be required, I would not like to state.

Q. Are there facilities at present adjacent to the plant for taking care of these employees?

A. No, sir, there are not. There are no houses within quite a long distance. I don't know how much in actual length.

By Mr. **Page**:

Q. There is quite a village right across the water, isn't there?

A. Yes, sir, but there are no ferry facilities going to it. Temporarily there is a tug running from one of the wharves across to Astoria. Stables, horses, harnesses and wagons, $10,000, is a very moderate figure.

By Mr. **Burr**:

Q. Will that be required or may it?

A. I don't think there is any question about it. It is a very moderate figure. Steel work for the second 15,000,000 cubic foot holder, $700,000, merely hinges on the question whether it
1751 is wise and proper to run a 20,000,000 gas plant with one holder with the possibility of that holder getting out of order at any time.

By Mr. **Mathewson**:

Q. What is your own judgment on that subject?

A. Well, $700,000 is a lot of money to spend. I would want the holder and I hate to spend the money. A second holder ought to be there. It was fully intended it should be there as soon as this other one was finished.

Q. In your judgment, would it be prudent to erect that holder in connection with the other holder, rather than rely upon a single holder?

A. Oh, there is no doubt about that. I don't like the idea of running a 20,000,000 works with one holder.

Q. What about the coal storage plant, bridge and foundation at Astoria, will those be required?

A. The coal storage bridge will be required undoubtedly, in duplicate, for the same reason, if one bridge breaks down, our method of handling coal is crippled. It is supplemented in this particular case—our bridge plan contemplates the rapid unloading of the coal to some extent from the main coal pile, and the question of transferring of this amount of very important material, I think there should be two bridges, I should say the second bridge ought to be included.

Q. Bridges are $150,000, according to the estimate each?

A. Yes, sir.

Q. To what do the foundations relate?

A. I cannot answer that question, nor the rope haulage. I have known but I have forgotten the exact application of it, so I do not want to testify to it.

Q. How about the construction of the Astoria plant?

A. Every contract that is made in Astoria, the bids are asked for by Mr. Bradley, as I think he testified, and when they
1752 come before me I take them to the executive committee and the officers do not act on any contract until the executive com-

mittee of the Consolidated Gas Company signifies their approval of the contract.

Q. That refers to all contracts for Astoria construction?

A. Yes, sir. Latterly there has been the necessity of very urgent work in small ways, and it has necessitated giving out contracts which are now limited to anything less than $1,000.

Q. The Executive Committee of the Consolidated Gas Company passes upon all before they are put into effect?

A. Yes, sir.

Q. Are these contracts let in competition?

A. Yes, sir, there is one—if that answer covers every contract that is made, I want to eliminate one.

Q. Well.

A. With the exception of one contract, which is the only one I can think of.

Q. Speak of it now.

A. The contract for the inclined retort house was let to Bartlett, Hayward & Company, they being the only builders in this country of inclined retorts that we had confidence in. The two installations that were put up by the Central Union, one by Bartlett, Hayward & Company and one by another concern, the Bartlett, Hayward stacks stood and the other one didn't.

Q. Have you considered from an engineering standpoint, Mr. Addicks, the question as to the cost of gas at Astoria, whether it can be made at a lower figure than the average which is produced now in Manhattan?

A. Yes, my simple judgment in engineering, not in the small details.

Q. What is your judgment upon that?

A. It depends largely upon the handling of the coke in Manhattan and the demand for coke.

Q. Well, assuming that the coke meets a reasonable market at a reasonable price, do you then think from an engineering standpoint that the gas at Astoria can be produced at a lower figure 1753 than the water gas is produced in New York City now?

A. No, not the water gas, but I think it can be and will be produced undoubtedly at a less figure than the coal gas in Manhattan, of course assuming in both cases it is 22 candle-power. Of course, you must not consider the unenriched coal gas there, and compare it with enriched coal gas here; but gas for gas, I think it ought to cost less in Astoria; but that judgment must be qualified on the question of cost of handling coke from Astoria into Manhattan, which is not a simple proposition. It is not like handling coal. Coke is a peculiar product. Gas coke particularly breaks up readily and it is difficult to handle it by manual labor. Of course, men have to use forks to handle it and hannot handle as much as coal, and my experience is they do not like to handle it at all. So it is absolutely essential in the Astoria proposition to handle it all mechanically, and that has not been done yet to my knowledge and that we will have to work out. I think the cost of gas in Astoria for the first year will undoubtedly be more than the cost of gas in

Manhattan, but I should not state that beyond the first year until we get shaken down.

Q. You are referring to a comparison between that gas and coal gas?

A. Only coal gas at 14th Street and 42d Street.

Q. As there is only one-fifth of the entire output which is coal gas in Manhattan?

A. About that, yes.

Q. The substitution of coal gas produced at a cheaper rate would affect in comparatively small proportion the cost of the total output of the company, wouldn't it?

A. In proportion to what the coal gas it displaced was to the whole amount of gas sold.

Q. How long ago was the construction of this plant at Astoria begun?

A. Before I came here. I came here I think in March, 1903.
1754 Some work in grading had been done before that, but the
primary contracts were given out, I think, the summer I came here, because I was asked when I first came here to go over all the plans of the works laid out and see if I could suggest any better plans; so it had not been advanced far enough but what changes could be made.

Q. To what purpose will the first unit be put when completed?

A. The extension for the supply of gas for our present output.

Q. Of your present sales?

A. Yes, sir.

Q. It will not be a replacement?

A. No, sir, that is not the idea.

Q. To take care of the gas which you procure from other companies amounting to about 3,000,000,000 feet per annum?

A. Yes, sir, roughtly.

Q. That would leave a margin to cover about how much increase?

A. Roughly 1,000,000,000.

Q. That is, a billion?

A. Yes, which represents about—which one thousand millions represents about six per cent., I think.

Q. I want to ask you, from your knowledge of the requirements of Manhattan and your experience as an engineer, whether you consider the construction of this first unit at Astoria was a prudent and wise action on the part of the company?

A. I think it was absolutely essential.

Q. Have you made an estimate of the value of the Manhattan plants of the company, including the holders, manufacturing plants of the company, based upon your knowledge as an engineer and your experience in the gas business and your familarity with the cost of gas construction as it has been involved at Astoria?

A. I did.

Q. What is your estimate of the cost of reproduction of those plants including the 18th Street plant so far as it has been taken by the city?

1755 Mr. **Page**: What does this include?

Mr. **Mathewson**: The Manhattan plants.

The **Witness**: It includes all the Manhattan plants; it includes 18th Street and includes all the city took at 18th Street. It is about $16,800,000.

Q. Does that include any interest in course of construction?

A. No, sir.

Q. Will you assume a year's interest at the rate of 5 per cent. on that construction?

A. Exactly or approximately?

Q. Give it to us with fair approximation. Five per cent. on $16,800,000.

A. About $840,000.

Q. And that added to $16,800,000 would make a total of how much?

A. $17,640,000.

Q. I want to ask you whether the item of interest in your judgment is to be included in the estimate of the total cost for plants?

Mr. **Gans**: I object to that as not a question for an expert's testimony.

Q. Well, how long would it take to construct plants, if in Manhattan, Mr. Addicks.

Mr. **Gans**: I suppose that depends upon how many men you put on the job?

A. It would depend upon a good many things.

Q. Under ordinary conditions, would it take as much as two years or three years, do you think?

A. Oh, yes, it is a question in my mind whether it would be three to five years. I should rather say five years. Astoria now has been under construction in one plant from 1902 until date. Now all that work is concentrated in a single plant. But when you distribute that over five or six, I think it would take longer. I would not like to be limited to a specific engineering answer to that because
1756 it is a matter of conjecture and judgment to some extent. It would not be shorter that Astoria, certainly.

Q. Have you made an estimate of the cost of gas based upon exhibit 94 for the calendar year 1905 including any other items which should be allowed, if any, in your judgment?

A. Yes, sir, I have.

Mr. **Page**: Would it not be better if this witness should testify to the cost of gas based upon his knowledge and experience rather than limit it to the figures which have been put in here by their accountant?

Mr. **Mathewson**: I accept that.

Q. Based upon your experience and knowledge in the gas business?

A. Of course including my experience with the Consolidated Gas Company (producing paper.) Have you a copy of this?

Q. Have you prepared it in the shape of a table, Mr. Addicks?

A. Yes, sir, I did.

Q. Well, I think I will have you put that on the record in the form that you have it as a foundation.

A. My answer is as follows:

1757 CONSOLIDATED GAS COMPANY—GAS BUSINESS—1905.

By Exhibit No. 94, Cost of Gas Delivered			74.81¢
Deduct Fixed Charges	7.32		
" Taxes, account other Companies	.48		
" Contingent	10.00		
		17.80¢	
Add—Actual Replacements	2.12		
" For Enrichment	1.83		
" " Repairs and Renewals	4.62		
" " Labor	.78		
" " Reserve	3.00		
		12.35¢	
Net Deductions		5.45¢	5.45¢
Net for Calendar Year			69.36¢
Receipts from Gas		102.03	
Miscellaneous Income		1.30	
Dividends:			
National Coke and Coal Company		.04	
			103.37¢
Difference for Calendar Year			34.01¢
Deduct Fixed Charges			7.32¢
Difference			26.69¢
Deduct 20¢ per 1,000 for an 80¢ rate			20.00¢
Remainder applicable to Dividends			6.69¢

Recess until 2.15 o'clock P. M.

1758 After Recess.

2.15 P. M.

WALTER R. AD[illegible]KS resumed.

Direct examination by Mr. MATHEWSON continued:

Q. Referring to the statement which you placed upon the record a few moments ago, I observe that you have in procuring the 69.36 cents net for the calendar year, deducted from 74.81 cents which was shown in Exhibit 94, fixed charges, the proportion of taxes that is applicable to securities of other companies or dividends paid on them, the contingent of 10%, and that you have then added 2.12 for replacements, 1.83 cents for enrichment, repairs and renewals 4.62 cents, labor .78 cents and reserve 3 cents. Now the 2.12 cents represents, as I understand it, the actual amount of the replacements for the calendar year; is that correct?

A. Yes, sir.

Q. What is 4.62 cents?

A. That represents the difference between repairs and renewals for the calendar year, and repairs and renewals for a period prior to the purchase of gas from other companies, a period of five years.

Q. What period of five years did you take?

A. Ending 1900, I think; five years prior to that.

Q. That represents a period during which the company procured no gas from other companies and will represent the situation when the company manufactures all its own gas by this new Astoria unit, does it?

A. That was the purpose.

Q. And do you remember what the renewals and replacements average in the five years to which you refer?

A. 12.31 cents from 1895 to 1899; not 1900, as I stated.

1759 Q. That compares with the average of 10.89 cents, average renewals per thousand, for the twenty years ending December 31, 1904, does it, of which we have had testimony?

Mr. Page: Objected to. I don't remember that in this case there has been testimony on that particular proposition.

Mr. Mathewson: Oh, yes, there has. There is an exhibit in evidence showing it.

The Master: Well, it is a conclusion, anyway. Isn't it a matter of argument?

Mr. Mathewson: No, I merely ask him whether that is the corresponding item for those five years.

The Master: Would not that appear on the face of the two statements or whatever there is in evidence?

Mr. Mathewson: No, it would take a computation for those five years. The figures are before the Master but he must compute the result. That it all. I do not desire to push it any further but merely to identify it as being the average for the five years in question.

Q. What does 1.83 cents represent?

A. That represents an additional cost of enrichment over and above that enrichment for the calendar year 1905, due to the increase in statute in regard to candle-power.

Q. The year 1905 included the first six months of the old 20 candle power which we maintain and the last six months of the 22 candle power?

A. Yes, sir.

Q. And this represents a year in which the 22 candle power will be maintained throughout the year?

A. Yes, sir; as they did not maintain in 1905 throughout the year.

1760 Q. What is .78 cents for labor?

A. That is the difference between the cost of labor for the prior four years and the cost for the calendar year.

Q. And the 3 cents reserve?

A. It is a reserve that was taken before the Gas Commission; the minimum figure that was used at that time.

Q. That is an arbitrary figure, is it?

A. Yes, sir.

Q. Do you consider that to be a reasonable figure?

A. Well the ten cents contingent is what I consider a reasonable figure wihch includes the three cents reserved and all these other matters.

Q. But you have deducted 10 per cent. for the purpose of this computation here?

A. Yes, sir.

A former question which was unanswered is now put in the following form, without objection.

Q. That corresponds with the average of 10.89 cents average renewals per thousand for the twenty years ending December 31st, 1904, does it, of which we have had testimony?

A. Yes. It merely takes a period of five years in place of the whole twenty.

Q. Now, in the tabulation following the 69.36 cents you have receipts from gas 102.03 cents?

A. Yes, sir.

Q. Does that include the amount charged the city for the maintenance of public lamps, as well as for gas furnished to the city?

A. Yes, sir.

Q. That item is not separated?

A. No, sir.

Q. And the miscellaneous income, 1.3 cents, does that include the entire miscellaneous income of the company?

A. Yes, sir, in connection with the gas business.

Q. And the National Coke & Coal Company dividend of .04 cents, what does that represent?

A. That is the $5,000 divided by the sales. It is not quite .04 cents, but that is the nearest figure——

1761 Q. And the 34.01 cents is the difference between the total receipts as so calculated and the amount chargeable to the cost of gas, 69.36 cents?

A. Yes, sir, leaving a balance of 34.01 cents.

Q. Does this miscellaneous income 1.3 cents include the rent from real estate, of the tenements?

A. Yes, sir.

Q. And also from gas stoves, rentals of gas stoves?

A. Yes, sir.

Q. Now, in Exhibit 94 there appears 10 cents per thousand charged which has been explained as including actual replacements and also covering contingencies. Which of these items which you have specified in the statement just before us would be included and go to make up that 10 cents?

A. All the items commencing with "actual replacements 2.12" and ending with "reserve, 3 cents."

Q. That will be 12.35 cents?

A. In this case, yes, sir.

Q. That would consume the 10 cents and 2.35 over?

A. Yes, sir, in this case.

Q. And this 4.62 cents for "repairs and renewals," is a difference, if I understand it, between the actual repairs and renewals for the year 1905, and the average of the repairs and renewals for the five years of 1895 to 1899?

A. Yes, that is true, but it has taken into consideration the repairs made by other companies on their own plants of the gas sold to us—the proportionate repairs to their works, based on the amount furnished to us under the agency agreements. In other words, we are comparing a time when the Consolidated Gas Company did all its own work, so we must take into consideration some of the repairs on the plants of the other companies, which amounts to .35 cents per thousand.

Q. With the exception of that .35 cents it is an amount to equalize the repairs and replacements for the year 1905 with the
1762 average of the repairs and replacements for the five years of 1894 to 1899?

A. 1895 to 1899, yes, sir. My figures are 12.31 and 7.34, making a total of 4.97 less .35 for the other companies, making up the figure of 4.62 cents.

Q. Did the figures which you gave as the estimate of the cost of the Astoria plant include any interest during construction?

A. No, sir.

Q. Will you state generally what the ten cents in Exhibit 94 was intended to cover; that is, the ten cents which was added at the end of exhibit to the cost of operation?

Mr. PAGE: Referred to as contingent expenses including renewals.

Mr. MATHEWSON: It is on page 380-B of the Exhibit Book.

A. Covering any minor extensions, renewals on account of extraordinary wear and tear, depreciation not covered by repairs, all supersession, accidents of larger moment than usual, fluctuations in business, changes in the cost of material, and electrolysis and other contingencies.

Q. Is there serious danger from explosion?

A. There is in the modern situation, in the construction of subways. To-day there is an entirely new element in the gas business introduced on account of it.

Q. By reason of the accumulation of gas or possible accumulation in the subways?

A. Well, during the temporary work of construction of course the presence of electricity in the street adds an additional hazard. We have explosions sometimes now from accumulations of gas, from stray currents, which we were not exposed to heretofore.

Q. Are you obliged to maintain any additional inspection by reason of the subways?

A. Yes.

Q. What?

A. Well, take the case of the subway, we have one or two men

now riding on the trains all the time. We have during con-
1763 struction a great many inspectors. Another element particularly at this time is the laying of the salt water pipes. That is involving an expense of about $500 a week at the present time.

Q. How does that impose an expense on you, the laying of the salt water mains by the city?

A. The city have the right of way and order us to remove our pipes and we have to move them. In this particular system it is particularly important that they should have an easy curve. It is a very high pressure system and it is necessary even more than in ordinary water construction to have no sharp turns in the pipes.

Q. You refer to the salt water system as a high pressure system, do you?

A. Yes.

Q. Are you familiar with the real estate, meaning the land owned by the company?

A. Yes, sir.

Q. Is there any of that land, which with due regard to the conduct of the gas business of the company now and in the reasonable future, you would consider might be disposed of?

Mr. Page: Objected to.

Mr. Burr: Also objected to as purely speculative.

The Master: I think he may give his opinion about it from an expert's standpoint.

Mr. Page and Mr. Burr except.

A. In general, no, considering no removal of the plant from Astoria. There are specific places where I think some specific pieces could be disposed of.

Q. Such as what?

A. Well, there are one or two pieces; there is one in particular at 18th Street which I think could be disposed of.

Q. What block is it?

A. It is that block between 16th and 17th Street- and between 10th Avenue and the marginal street.

1764 Q. Well, that is land which was occupied by the 18th Street plant, is it not, which plant was condemned by the city?

A. It was a portion of that plant.

Q. And the present ability to dispose of it rises from the appropriation of the rest of the plant by the city?

A. Yes, sir.

Mr. Page: Will you see if you can have that identified by block and lot number? You have it on that map, haven't you?

Mr. Mathewson: Block No. 688, Lot No. 21.

Q. Some parcels have been mentioned, such as the south side of 65th Street, three lots, where plans for a valve house have already been filed. Would it be prudent, having regard for the business of the company, to dispose of that?

A. No, that was purchased within two years, I think, for the purpose of erecting that house. That is on the West side.

Q. Yes; and it has been testified that the East side of Avenue A, corner 60th Street, is intended for a valve house. Would the same apply to that?

A. Yes. That was not purchased within the last two years, but the same principle applies to it.

Q. Is it possible, in your experience, to wait until the moment that you desire to erect a holder to acquire the property or land for that purpose?

A. It would be very unwise to do so; you would have to pay a very high price for your property.

Q. And wherever property is not at present, or any fraction of the property, is not at present actually covered by manufacturing plan-s or holders do I understand that the income therefrom is credited by you in the statement that you have presented to-day, to reduce the cost of gas or offset that, in the miscellaneous income?

A. It shows in the net.

Q. In ascertaining what remains for distribution as divi-
1765 dends?

A. Yes, but not the cost of gas; it does not appear there. It only appears in the net.

Q. Have you ever had any experience with gas companies where competition arose, where there were contests or gas wars, so-called?

A. Yes.

Q. Much or little?

A. I think much.

Q. What concessions in your experience are necessary by a competing company in order to draw business from the established company?

Mr. PAGE: How is that material to this case?

Mr. MATHEWSON: It is material in this way. Among other things we have alleged that we have a good will and an established business, that it has a value and a large value, and the extent of reduction in the price of gas which it is necessary for a competing company to make in order to procure that from us to draw it away from us is a very valuable element in determining the value of the good will and established business. That is recognized by the court as an asset upon which we are entitled to count.

Mr. PAGE: I do not know of any court that has recognized it as an asset.

Mr. MATHEWSON: We do.

Mr. PAGE: And I do not see how it is material or relevant here as to what some other companies that are engaged in competition may do, where they have not against their charters monopolized the business, as you have here.

Mr. MATHEWSON: I do not know what you are talking about, when you say against their charters.

Mr. PAGE: Or by reason of the fact that they have obtained a monopoly, they are entitled to charge the public more by the very fact that they have become a monopoly against the statutes of the State.

1766 Mr. **Mathewson**: That is another case, and we are not a monopoly; and the courts have expressly held it in a similar case.

Mr. **Burr**: I think it is irrelevant unless the condition of the companies to which he refers is shown to be exactly the condition of this company in the city of New York, so far as its rights in the streets are concerned.

The **Master**: I do not regard it as evidence of very great value, but I will take it for what it is worth and give you gentlemen an exception.

Exception taken by Mr. Page and Mr. Burr.

A. I think a minimum of 10 per cent. of the selling price existing.

By Mr. **Page**:

Q. 10 per cent. of the selling price of what, the plant?

A. Of the selling price of gas to private consumers.

Q. Would that apply also to the public lighting?

A. Yes. But it does apply to the public lighting to a degree perhaps larger than 10 per cent.

By Mr. **Mathewson**:

Q. Is it your experience that where consumers have connections and established relations with a gas company, it requires some special incentive to compel them to change?

A. Yes, sir.

Q. And the incentive you have mentioned is the 10 cents, is it?

A. 10 per cent., not 10 cents.

Cross-examination by Mr. **Burr**:

Q. Is the land that you use for the purpose of manufacturing gas any more valuable to-day for that purpose than it was in 1884?

A. I do not know.

1767 Q. Can you make a better quality of gas on that land to-day than you could in 1884?

A. I think not, whatever the gas was—the same gas.

Q. You cannot make any more gas than you could in 1884 on that land?

A. I think they do make more gas.

Q. That is by the addition of more apparatus?

A. Yes, sir.

By Mr. **Mathewson**:

Q. And by using water gas apparatus in some instances instead of coal gas?

A. Yes.

By Mr. **Burr**:

Q. What are your duties, exactly, with the Consolidated Gas Company?

A. I am vice-president of the Consolidated Gas Company, sir.

Q. And your duties as vice-president of that company are what?

A. Well, the duties which devolve upon me in the absence of the president, or that come before me from time to time.

Q. Is Mr. Bradley under your supervision or control?

A. Yes, sir.

Q. Mr. Simpson?

A. Yes, sir.

Q. Mr. Carter?

A. Yes, sir.

Q. Repairs and replacements to the plant are submitted to you first?

A. No, sir, replacements are submitted. They have to be submitted to the Board of Directors.

Q. And in addition to your duties as vice-president you also have duties as engineer of the company?

A. No, not at all.

Q. Then you do not control the action of Mr. Bradley, the chief engineer of the company.

A. I could do so, I presume; I do not control him.

1768 Q. Well, in whatever is contemplated or done in regard to the plants of the company, do you take the initiative or does he?

A. Well, it would be very apt to be done under his initiative primarily.

Q. He would make a recommendation and you would pass upon that recommendation?

A. No, I would not pass upon it except so far as I would advise with him, but the trustees would pass upon it.

Q. You mean the trustees or the executive committee?

A. The executive committee or the trustees; either one or the other; both sometimes.

Q. Now, your first connection with the Consolidated Gas Company in an official capacity was when?

A. If I remember correctly, on the 1st of March, 1903.

Q. And where had you been employed before that?

A. In Boston.

Q. As supervising engineer of the gas companies there?

A. I was chief engineer of the Boston group at that time.

Q. Did you become vice-president at once of the Consolidated Gas Company?

A. Yes, sir.

Q. And while you have been vice-president of the Consolidated Gas Company have you been acting as consulting engineer for the Boston companies?

A. I did for a period.

Q. For what period?

A. Something over a year after I left Boston.

Q. And I understood you to say that at the time of your advent into the Consolidated Gas Company, the plan regarding Astoria and the plant there was already under way?

A. The plants were all made and some of the work was under way, yes, sir.

Q. You had nothing to do with the selection of that location?

A. Nothing whatever.

Q. Did you have anything to do with the planning of the plant there?

A. No, except as stated this morning. I was asked to go 1769 over the plant and if I could make any suggestions they would be very glad to have them.

Q. Did you approve of what was being done at that time, or did you object to any portion of what was contemplated at that time?

A. I made one or two suggestions that were carried out.

Q. You did not know of course the reason, of your own knowledge, I mean, for the removal to Astoria?

A. No, sir.

Q. So that when you testified before the Gas Commisison that the reason for the construction of the plant at Astoria was because the city demanded it, that was mere hearsay on your part?

A. Well, it was my impression that I had of the situation, and from what I know from time to time after I arrived there.

Q. You do not know as a matter of fact that the city has made such demand upon the Consolidated Gas Company do you?

A. No, sir, I do not; of course I know the city favored it, but I do not know about a demand.

Q. In what way did the city favor it?

A. In conference with Mayor Low; they seemed very desirous of furthering the Astoria improvement, but that was not in the nature of a demand.

Q. At that time that you refer to, was it contemplated that the Astoria plant should be supplemental to the plant here or instead of the plant here?

A. The first unit would be supplemental, and the additional units would be built and take the place of all the manufacturing plants in the Borough of Manhattan that belonged to the Consolidated Gas Company. That was my understanding.

Q. Was it your understanding that all the plants were to be removed from the Borough of Manhattan in course of time?

A. The Consolidated Gas Company only; not the holder stations.

Q. Didn't you testify before the Gas Commission that some 1770 of the smaller holders were to be removed?

A. They were to be removed in the natural course of events and be replaced by still larger ones; but the volume of capacity would be increased on the Island, not decreased. I do not know whether I so testified, but I say so now.

Q. Have you a statement of the maximum capacity of each of the subsidiary companies?

A. I have such a memorandum; I do not know whether it is absolutely up-to-date.

Mr. MATHEWSON: Mr. Bradley, you know, gave all that.

Mr. BURR: He summarized it?

Mr. MATHEWSON: No, he gave it in detail for each one.

Mr. BURR: If you cannot find it, never mind.

A. I have it now. The Standard I have as eleven millions, the Central Union, seven million five hundred thousand. If I remember correctly, however, that is not all available; that is to say, some of it is coal gas and some of it is water gas, but I do not think they can make the full capacity of both at the same time.

Mr. MATHEWSON: I think that was corrected to five million five hundred thousand, which made a difference between Mr. Bradley's first total and his revised total.

A. (Continuing:) The New Amsterdam, thirty millions, the Mutual I have as eighteen million. I am not sure about that figure. I think I have covered them all.

Q. To what date is that compiliation of the capacity of the subsidiary companies?

A. It is some time during 1905. I do not know the date I made it.

1771 Q. That makes a total capacity of sixty-six million five hundred thousand?

A. That is what I have it.

By Mr. MATHEWSON:

Q. Does that include the Central Union, seven million five hundred thousand?

A. Yes, that would have to be deducted. I do not remember that figure of the Central Union. It has a water gas capacity of four million and a coal gas capacity of three million and a half, but they cannot handle both of those gases. It should be some intermediate figure.

By Mr. BURR:

Q. When you became vice-president of the Consolidated Gas Company, did you make an inspection of the plants of the Consolidated Gas Company?

A. Yes, I think I inspected all of the Consolidated Gas Company's plants.

Q. And did you inspect the plants of the subsidiary companies?

A. Well, I cannot say that I inspected them. I visited all the plants except the Mutual. I do not think I have ever visited the Mutual since I have been there.

Q. That was in 1903?

A. Yes, sir.

Q. Did you find all the plants of the Consolidated Gas Company in operation at that time when you made the inspection in 1903?

A. I am not sure about 18th Street; I think I saw them all in operation, but I won't be positive about 18th Street.

Q. Was 111th Street in operation?

A. As a manufacturing plant?

Q. Yes.

A. No.

Q. How many coal gas plants did you find in operation in 1903?

A. 14th Street and 42nd Street certainly, and probably 18th Street.

Q. How many water gas plants?

A. 21st Street, 99th Street and 44th Street.

1772 Q. I understood you to say that you arranged for the purchase of the oil for the company?

A. The last contract, yes.

Q. Who arranged for the purchase of the oil prior to the last contract?

A. I think the president did, Mr. Gawtry.

Q. Do you know how long the company had been purchasing oil from the Standard Oil Company?

A. No, sir.

Q. Did you make any effort to get oil from any other company besides the Standard Oil Company?

A. No, sir.

Q. Have you attended to the purchase of coal for the various stations of the Consolidated Gas Company?

A. In the way in which I explained this morning.

Q. By advertising?

A. No; I said one of the officers of the company obtained the figures and submitted them to me and I submitted them to the executive committee.

Q. Of course the character of the coal has a great deal to do with the character of the gas produced, has it not?

A. Yes.

Q. And have you sought to procure any special kind of coal?

A. The best for the purpose with the qualifications that it was to be deliverable in certain portions on different railroads. We do not want to buy all our coal on one railroad.

Q. Why?

A. If there is a strike on that railroad we don't get any coal.

Q. Do you keep a record of change in rates of mining and of freight?

A. I do not.

Q. But you see to it if there is any change in rates of mining and rates of freight, that if the company is entitled to a reduction because of such change, the company gets it.

A. That is considered as one of the elements of cost.

1773 Q. Who takes charge of it, you personally?

A. I do not, personally.

Mr. MATHEWSON: Mr. Carter had all that information this morning for you and waited for your examination on that point. You asked him to be prepared and he is prepared.

Mr. BURR: I think I asked this morning if Mr. Carter was ready with any of the information that I asked for.

Mr. MATHEWSON: No, statements, exhibits.

Q. What is the total capacity of the Consolidated Gas Company?

A. 51,000,000 feet, I think.

The MASTER: Has not that been answered seven or eight times by different people in one form or another?

Mr. BURR: I want to know whether this witness agrees with the other people.

The **Master**: All right.

The **Witness**: My memory is 51,000,000, exclusive of 18th Street.

Q. Before the Gas Commission you testified, did you not, regarding the capacity of the plants of the Consolidated Gas Company?

A. I think I gave the capacity and the amount of gas they had made.

Q. You testified as follows, didn't you?

"For the years 1905 and 1906, 14th Street, coal gas, 5,000,000 cubic feet; 18th Street, coal gas——

A. (Interrupting.) I think I can get the momorandum from which I testified, if you will allow me to, I had it a moment ago. I think I am ready now.

Q. Proceed, please.

A. I thought you were going to read there.

1774 Q. (Continuing:)

"18th Street, condemned by city, 3,500,000 cubic feet; 42d Street, coal gas, 4,500,000; total coal gas, 13,000,000 cubic feet. Net, deducting, 18th Street, 9,500,000 cubic feet.

Carbureted water gas, 21st Street station, 24,000,000; 44th Street station, 8,500,000; 99th Street station, 5,500,000. Total carbureted water gas, 38,000,000 cubic feet and oil gas, 21st Street 3,500,000."

A. That is correct, sir.

Q. And you further stated:

"I might say, in connection with the carbureted water gas, that the quantities given still leave a reserve in the generating capacity; that is to say, there are certain generators not running, when I give those capacities."

A. That is right.

Q. So that with those generators in operation, the capacity would be greater?

A. Yes, but water gas generators are very apt to break down and you must have some to spare for that purpose.

Mr. **Mathewson**: That makes 51,000,000 cubic feet.

The **Witness**: 54,500,000; less three million and a half for 18th Street, 51,000,000.

Q. And you testified that the maximum make of gas in these works as of October 31st, 1905, was 42,459,000?

A. That is correct; I think I gave it in detail.

Q. You further stated that that was not on any particular day, but that it was the maximum make of each particular works on various days, one is January 24, another January 4, another

1775 January 7th, February 2nd, January 5th, January 19th?

A. Correct.

Q. There is a distinction between make and output, is there not?

A. Yes, very decided.

Q. Will you explain the distinction?

A. The output may be entirely independent of the make; it would be the amount of gas that was lost in the holders plus the make, or the make less the amount of gas gained in the holders. It varies from day to day constantly.

Q. The output of gas is the total amount of gas which is made, plus or minus the difference in the quantity of gas in the holders from one morning to the next, is it not?

A. Yes, sir.

Q. You gave in detail the capacity of the various stations as of the dates named before the Gas Commission, didn't you?

A. The amount of gas made.

Q. The amount of gas made?

A. Yes, sir. I think I gave those in detail.

Q. Have you those details with you now?

A. Yes, sir. You have mentioned the dates already.

Q. Yes, but I mean the amounts?

A. Yes, sir, I have them.

Q. Give them?

A. 14th Street, 4,994,000, January 24th. 21st Street, water gas 17,997,000. Oil gas 598,000. 42nd Street, 4,658,000. 44th Street, 8,897,000. 99th Street, 5,315,000. Does that agree with the evidence?

Q. Look at the printed record of the Gas Commission and see if that refreshes your recollection as to those amounts?

A. I notice some places I give the maximum capacity and follow it with the actual make, so there are two figures appearing here.

The **Master**: Exactly what is the point here? I am afraid you are going to get our record in some confusion, the way this goes in. Can't you put that in in a block, or have you already put it in, or what is the idea? 1776

Mr. **Burr**: I want to get a statement from this gentleman of the details of the capacity at all the various plants.

The **Master**: Why cumber the record with these references to his testimony in the previous proceedings? Why not let him use it for purposes of refreshing his recollection, if you like, and go on and put it in as a clean matter in our record.

The **Witness**: I might say the figures are identical to those I have just read.

Q. The maximum make of gas in these works in one day was 42,459,000 cubic feet, isn't that correct?

A. No, sir.

Q. How much was it?

A. I have not given the maximum make on the same day. The sum of all the maximum makes on the various days was 42,459,000, the figure you gave, but as these maximum makes did not happen on the same day it would not be the maximum make of those works for a day.

Q. Can you say what stations you intend to abandon and what stations you intend to retain in the Borough of Manhattan?

A. No, sir.

Q. Can you state whether you intend to abandon the coal gas plants or the water gas plants?

A. I think with 80 cent gas we cannot abandon anything, in consideration of 80 cent gas. You will have to separate your question.

Q. I am asking now with regard to the construction of the plant at Astoria. Do you intend to abandon the coal gas plants here when that first unit is completed?

A. I cannot say Mr. Burr, that we intend to abandon anything under the conditions which exist to-day in New York.

1777 Q. Will the company retain, after the completion of the Astoria plant, any of its present manufacturing plants?

A. I cannot answer the question Mr. Burr.

Q. Didn't you answer that question before the Gas Commission by saying, "The idea of Astoria was to replace all the manufacturing plants in Manhattan."

A. Yes.

Q. And you were asked this question, "That is a determined and fixed policy?" and you answered, "That is the policy of the company." Is that so?

A. I think that was correct.

Q. When did you cease to manufacture gas at the 18th Street station?

A. I don't recall that Mr. Burr. I have stated by looking at memoranda, but I cannot recall now whether it was 1903 or not. I have made a distinct statement in regard to that but I cannot recall it. My recollection is that there was no gas manufactured there in 1904, but I would not be sure of it.

Q. There is nothing but coal gas proposed for Astoria at the present time, is there?

A. Nothing, sir. I would say that the question of candle power, of course, will probably have some bearing on the subject.

Q. Do you know what the dimensions of the tunnel are that it is proposed to run from the Astoria plant to the Borough of Manhattan?

A. Something like 24 feet inside diameter, if I remember correctly.

Q. 28 feet, isn't it?

A. I think it is 28 feet outside, but I think it is 24 feet inside.

Q. How much below the surface is it proposed to lay that tunnel?

A. Some 200 or 250 feet.

Q. And how long is that tunnel to be?

A. I think something between 7,000 and 8,000 feet.

1778 Q. In addition to that tunnel you have a tunnel from Ravenswood through Blackwell's Island 10 feet in diameter, haven't you?

A. The New Amsterdam Company has.

Q. Will there be any loss to the Consolidated Gas Company by the removal to Astoria?

A. If they should move all their plants?

Q. Yes.

A. Yes.

Q. How much?

A. $10,400,000 for the plant, assuming 20 per cent. salvage, in the water gas apparatus.

Q. There is no preparation being made for water gas plants at all in Astoria, is there?

A. Not so far, no sir.

Q. Do you know any reason, Mr. Addicks, for the construction of the plant at Astoria other than this reason which has been given by Mr. Bradley, of the difficulty with the city authorities?

Mr. Mathewson: That has nothing to do with the first unit, you know, Mr. Burr.

Mr. Burr: Pardon me, Mr. Mathewson.

A. I think it is very essential to look to the future and care for the present of the Consolidated Gas Company, and that would necessitate another plant.

Q. That is what I want stated a little more definitely. Is it for the purpose of looking to the future that the plant is being constructed to satisfy the requirements of the future or is it because of some present agitation on the part of the city to cause your removal?

A. I think it is to care for the present, looking forward to the future, in a large comprehensive way in coming years.

Q. You do not mean to intimate in the slightest degree, do you, that there is any coercion on the part of the city which causes this transplanting to Astoria?

A. Well, I think it would be indirect rather than direct. When you cut a street through the middle of the works and take off
1779 all your water front, it seems to me it is coercion on the part of the city to make you do something else. When you cut streets through and interfere with the manufacture, of course it may be indirect, but nevertheless it is very effective. We have also had trouble even in the past year with the smoke ordinance, and threatened with arrest, &c., for making smoke in the manufacture of coal gas, which we could not avoid.

Q. Was it because you were committing a nuisance?

A. No, I do not consider a gas works a nuisance. There is always smoke in a gas works and you cannot prevent it. It is absolutely impossible.

Q. Then you consider the ideal location for a gas works is where it cannot hurt anybody by reason of smoke and smell?

A. I think the tendency of modern times is to get all gas works out of the centre of population everywhere.

Q. So that these three considerations entered into the removal to Astoria——

A. Well, I am merely expressing my point of view as I see the situation.

Q. Before the Gas Commission you were asked: "Will you state the causes of the removal to Astoria so far as you know of the generating plant in Manhattan?" To which you answered: "The primary purpose of removing was the demand on the part of the city that the works should be discontinued. There has been in the past serious agitation in regard to it and constant complaints on the part of the Board of Health and others; and the fact of the works being a nuisance. Of course, I said the other day as an engineer that I did not concede that a gas works is a nuisance in the sense of being prejudicial to public health. But there is constant complaint of the works from various sources." Did you so testify?

A. I think so, yes, sir.

1780 Q. And you had no knowledge of any positive act on the part of the city to compel these plants to be removed?

A. I had knowledge of objection to the works. I think there was a suit in connection with 14th Street, the smoke and dirt, by the Willard-Parker Hospital. I think that is one of the things I had in mind.

Q. Does it still remain true that the primary cause for the removal of these plants is the demand on the part of the city that the works should be discontinued?

A. I think in the sense in which I have testified to-day. I cannot add or take from anything I have said. I think.

Q. Do you know of any public official, or authority or municipal authority in the City of New York who has ever made such a demand?

A. I don't say in the shape of a written demand. I don't remember anything of the kind. There may have been before my time. As I said, Mayor Low was certainly very desirous of having the gas works out of the city and so expressed himself.

Q. This plant at Astoria is located in the Borough of Queens, isn't it?

A. Yes, sir.

Q. And it is possible for you to light up the Borough of Queens from that location, isn't it?

A. Yes.

Q. In your opinion, is the sale of gas going to increase in the Borough of Manhattan?

A. I think it will, yes, sir.

Q. Have you arrived at that conclusion from the consideration of past circumstances?

A. In a general way, consideration of the gas business and being familiar with the gas business.

Q. Does the consumption of gas keep a certain ratio or proportion with the increase in the number of people?

A. I cannot say that altogether.

Q. Do you believe that the consumption of gas in the Borough of Manhattan has reached the point of saturation?

A. You would have to qualify that and say what the point of saturation is.

1781 Q. What do you figure out is the per capita consumption of gas in the Borough of Manhattan to-day?

A. I think I made some figures about that, if I can turn to them at the moment. (Referring to papers.) I cannot turn to them at the moment. I will say from memory it is nine thousand and some hundred feet, I have forgotten the exact figures.

Q. Over nine thousand, isn't it?

A. Over nine thousand.

Mr. Page: 9,400, was it not?

The **Witness**: I have it somewhere.

Mr. **Mathewson**: Per capita, not per consumer.

Mr. **Page**: I was speaking from recollection.

Mr. **Mathewson**: Yes, it is over nine thousand.

The **Witness**: I do not see it here at the moment.

Q. Well, you are familiar with all the great gas plants of the United States, are you not, Mr. Addicks?

A. Well, I have been in a great many.

Q. Outside of the city of New York, where are the largest plants located in this country?

A. I should say the larger cities by population would indicate it; Chicago and St. Louis, and New York and Boston and other large cities.

Q. And Philadelphia?

A. And Philadelphia.

Q. Have you ever had occasion to ascertain the per capita consumption in the city of London?

A. Well, I have been told what it is; I don't know that I actually made the figures myself.

Q. What I want to arrive at is this; is it not a fact that the consumption per capita is larger in the city of New York than any other city in the world?

A. I believe it to be; anything within my knowledge.

1782 Mr. **Mathewson**: I think London is about 7,500 cubic feet per capita.

The **Witness**: I would like to say, Mr. Burr, if you do not understand it, that that includes all the gas in Manhattan Island, that figure which you gave, all the companies——

Mr. **Page**: On page 1672 of the record it was given I think by Humphreys as 9,200 feet in New York and 8,000 to 8,500 in London.

Q. Do you agree with the statement of Prof. Humphreys before the Gas Commission as follows:

"In considering the question of increase in sales a good many points have to be considered, and certainly what I should call the point of saturation has to be considered. To-day, if my information is correct, and I believe it is, New York is selling more per capita than any other city in the world. It is selling nearly 9,200 feet annually per capita, a little less than that, about 9,150 feet, I think it is. London is selling somewhere between 8,000 and 8,500 feet."

A. I understand that to be correct, and I think Mr. Humphreys is very careful in his statements and always investigates a question before he makes a statement, and I should take that to be correct.

Q. What do you call the point of saturation, Mr. Addicks?

A. Well, what I would understand by the point of saturation, referring to the population, is that the amount, dividing the total sales of gas in any year by the population of the city, would be a maximum figure; in other words, that in future years you cannot expect to exceed that number of feet for each man, woman and child in the city.

1783 Q. Well, do you agree with the definition and conclusion on that point of Prof. Humphreys before the Gas Commission, when he was asked, "What do you call the point of saturation?" And he answered "To give you a physical conception of it, you know the atmosphere can absorb so much moisture for a given temperature. If that temperature drops, the moisture drops also and I think if the conditions change here, that some of the gas is going to be dropped also. The conditions are such now, we will say the electric light, and so on, that we cannot safely depend upon estimates made in the past as to what our increases will be in the future, and certainly we cannot expect to go on at the same percentages, despite the fact that we have already arrived in New York at a figure never surpassed in the world's history, 9,000 to 9,200 feet per capita. The people are consuming about as much per capita as they will be likely ever to consume." Do you agree with that statement and conclusion of Professor Humphreys?

A. I do not care to include all the simile, because I did not follow all parts of it, but I do think that the tendency of the time is such that we have about reached the maximum amount of gas used for each person in New York City. If that is the conclusion of all you have read, I agree with it.

Q. Then you agree with the statement in which he concludes "that the people are consuming about as much per capita as they will be likely ever to consume?"

A. I think it is very probable, taking conditions as we see them existing to-day in the Island of Manhattan.

Q. What do you assume the increase will be, if any, in 1907 over 1906?

A. I have assumed one per cent.

Q. And you also assumed 3 per cent. annual increase compounded thereafter until 1910, didn't you?

A. Yes.

1784 Q. And you obtain by that method a total output of 15,099,815,000 cubic feet?

A. Yes, sir.

Mr. MATHEWSON: When?

The WITNESS: In 1910.

Q. Now you base that calculation upon the Board of Health census of 1905 for Manhattan, of 2,117,375 population?

A. I do not recall how I based that particular calculation. I gave a number of figures on the increase of gas based on population, also based on the amount of gas used per meter. I had two or three figures, if I remember correctly, and I assumed a 3 per cent. increase, which gave this 15,099,815,000.

Q. Will you look at the printed record of your testimony before the Gas Commission as it appears on page 1567 and see whether that refreshes your recollection, and whether you can now state the method by which you arrived at the computation stated as affecting the year 1910?

A. Yes. This 15,099,815,000 cubic feet was one estimate. I want to say that this does not refresh my mind in reference to any typographical errors. I stated that the population in 1905 was 2,117,000, according to the Board of Health, and to check that I ascertained the State census, June, 1905, 2,112,000, and I noticed that the greatest increase in population was 55,468 in any one year——

Mr. Mathewson: I do not think you need to continue that. Mr. Burr has not asked for anything further.

The Witness: I took the sales per capita of the Consolidated Gas Company—not of all the companies—of 6,274 cubic feet and arrived at another figure.

Q. That was the figure which you gave for 1905?

A. No.

1785 Q. 6,274 feet as the per capita sales of the Consolidated Gas Company?

A. Apparently. I see I assumed 6,300.

Q. And you gave the Consolidated Gas Company sales per capita for 1903 as 6,358 cubic feet?

A. Yes, and 1905 had fallen off slightly and I multiplied that and obtained the figure 15,166,462,000 as the output for 1910.

Q. And you gave the figures for 1900 of the Consolidated Gas Company's sales per capita at 5,340 cubic feet?

A. Apparently, yes.

Q. Can you state the number of meters in proportion in the Borough of Manhattan to the population furnished by the Consolidated Gas Company?

A. I have such figures. I will try to find them, and that will save time Mr. Burr.

Mr. Mathewson: The number of meters is in evidence and cannot your accountants divide the population?

Mr. Burr: I will ask him in regard to it.

Q. Is it a fact that one meter is furnished for each 5.4 persons?

A. I cannot recall that amount now; that sounds familiar, Mr. Burr, but I cannot confirm it at the moment.

The Master: To what extent and in what way does this line of cross-examination tend to affect any of the direct-examination of the witness?

Mr. Burr: Well, I may be mistaken, but I understood him to give some figures here of the cost of manufacture and distribution of gas in the City of New York and Borough of Manhattan, and I think I am entitled to cross-examine him upon all the elements which go into the manufacture and distribution of gas.

1786 The Master: No doubt, but I wanted to see the connection, that is all, between this present line of inquiry and what he has testified to. It was not quite apparent to me.

Mr. Mathewson: I was on the point of objecting several times, but I didn't like to, on the ground that it is not cross-examination. The testimony to which the witness's attention has been called in the printed record was testimony on rebuttal on our part after that subject had been treated upon by the complainant before the Gas Commission, and this examination has no relation to our direct evidence presented here.

Mr. Burr: I may be all wrong, but I think I am here to meet a contention on the part of the counsel for the Consolidated Gas Company, supported by this witness, that the rate fixed by the Legislature is confiscatory.

Mr. **Mathewson**: That is another proposition.

Mr. **Burr**: And if there is any information which this gentleman has in regard to that particular subject, I am entitled to know it.

The **Master**: Nobody disputes that, Mr. Burr. The only question is as to how these matters you have been bringing out have any specific bearing on the subject. I have got to pass on it some day, and it might facilitate me if you could make it clear to me what you are driving at.

Mr. **Mathewson**: It is not, too, part of his direct case, if it is material at all, where it does not touch anything we have put in?

Mr. **Burr**: I am furthermore entitled to examine this witness regarding evidence he gave before the Gas Commission upon
1787 which the Gas Commission made its order.

The **Master**: Similarly, there is no dispute about that. But that does not meet the point of my inquiry. I am not in the least disposed to cut off counsel in the fullest latitude of cross-examination, but for my own information I would like to see some useful purpose coming out of it.

Mr. **Burr**: In a word, I want to show that there is really no existing necessity for the Astoria plant, so far as present conditions obtain in the Borough of Manhattan, and that the cost of that plant should not be saddled upon those existing to-day and that if there is any reason for the construction of that plant, it should be saddled upon those who are to come after.

Mr. **Mathewson**: Is that affected by showing the increase of the output of gas or the prospective increase in the output of gas? This method of examination, instead of your putting in the testimony in your direct case, as to what you expect to be the increase, and we being allowed to put in evidence in rebuttal, is simply putting in our evidence, so to speak, in advance and putting you in in rebuttal with your witnesses, if you do not agree with them. It is putting the cart before the horse it seems to me. I submit that it does not touch upon anything upon which we have presented evidence here.

Mr. **Burr**: Of course it is very——

Mr. **Mathewson**: It is part of your case if it is at all.

Mr. **Burr**: Of course it is very agreeable to Mr. Mathewson to hand in a statement showing the remainder applicable to dividends as 6.69 after the computation made on this Exhibit or statement which has been entered upon the record, but I think I am
1788 entitled to cross-examine this witness on every item which goes to make this record upon this short paper which has been handed in.

The **Master**: As I say, I did not dispute it, but how the last few questions have any bearing on it, I do not perceive yet.

By Mr. **Burr**:

Q. In the statement which you gave to-day, showing the gas business in 1905 of the Consolidated Gas Company, you have an item reading "deduct fixed charges, 7.22." What fixed charges do you refer to, and what is the amount of such fixed charges upon which you base that statement?

A. The net interest on our debentures of about twenty million dollars, less——

Q. Are those the debentures which were issued to obtain the stocks in the electric light company?

A. No, those were issued a year or two ago on account of Astoria construction. Deducting any interest we may obtain on the temporary loans, and that appears in Exhibit 94.

Q. Is that this item of $936,883.24 appearing on Exhibit 93, and the item of fixed charges, $972,423.44, appearing on Exhibit 94?

A. 7.32 is the fixed charge. $972,423.44 appearing on Exhibit 94.

Q. Have you an analysis of that charge or item of fixed charges, showing the various sums that are charged against various things making up that total of $972,423.44?

A. No.

Mr. Mathewson: Mr. Carter has testified on that subject, Mr. Burr, and showed what the total fixed charges were, and what he received from temporary investments and how this balance arose.

The Master: That is my recollection.

1789 Q. So you know nothing about fixed charges except as the total is stated here in Exhibit 94.

A. I haven't it in mind, excepting in so far as I stated what the fixed charges were.

Q. Well, you take the fixed charges as they were presented to you by Mr. Carter in this Exhibit 94?

A. Yes, sir, from the books of the company.

Q. And you could not state offhand now what that item is made up of?

A. No, not at all.

Q. But you can state generally, what the item of fixed charges represents?

A. I think so, yes, sir.

Q. Will you state?

A. What I said—it was the difference between the amount we have to pay for our debentures and the interest received from our temporary investments and loans, in a general way.

Q. The analysis of these fixed charges appears on State's Exhibit I, does it?

A. Apparently they correspond in amounts.

Q. Do you know what particular bills payable are referred to in this State's Exhibit I?

A. No, sir.

Q. But you do know that the debenture bonds and convertible debentures referred to are $20,000,000 of debentures issued within a year or so by the Consolidated Gas Company, and no more?

A. Well, there are debentures also, a few 5 per cent. debenture bonds, apparently in addition to that.

Q. Are those the 5 per cent. debenture bonds which were used in the acquisition of the stock of the Electric Light Company?

A. I don't know what that was used for. It was before my time.

Mr. Mathewson: Mr. Carter has explained those were debenture bonds of [illegible]8, of which something over a million are outstanding, and he explained in addition this exhibit in the greatest detail, exactly what that was.

Q. This item of .48 cents, taxes account other companies;
1790 where did you get that figure?

A. That is the amount of the taxes paid on the securities owned by the company—securities of other companies, which should not be included in the cost of gas as not being involved in our gas business.

Q. And the contingent 10 cents is the fund which was agreed upon to be charged against the cost of gas at a conference in 1905; is that the fact?

A. I don't remember when it was definitely agreed upon, I haven't got it in my mind. The matter was talked over a long time.

Q. It was not charged when you first took a position with Consolidated Gas Company?

A. No.

Q. It was not charged in 1904?

A. It was talked over, I think, in 1904.

Q. But actually charged in 1905?

A. Yes.

Q. And was that your suggestion?

A. I don't know whether it was a result of my suggestion or not. It probably was. In my judgment it was, but whether it was or not I can't remember. I discussed the matter seriously months before it was ever done.

Q. Did you make up any tabulation at that time apportioning part of that 10 cents to each of the things which entered into your conclusion on that subject?

A. No.

Q. It has been testified to that that was an arbitrary figure, arbitrarily fixed?

A. I don't consider it an arbitrary figure. I think it is a figure fixed on the question of business judgment and experience.

Q. Why do you not also deduct the item of street lamps as appears on that Exhibit 94, Mr. Addicks?

A. Why should I?

Q. Street lamps, 2.18?

A. I don't know why I should.

Q. That is the item which represents the cleaning and repairing of the street lamps?

A. Yes, sir.

Q. Shouldn't you also deduct the interest on the con-
1791 sumers' deposits which appears on Exhibit 94 as .39 cents?

A. No, sir, I don't think so.

Q. Upon what theory do you allow that to remain?

A. On the theory that we pay it out as part of the cost of gas. It is not retained in our capital, as I remember it.

Q. Shouldn't you deduct the item of repairs to gas stoves .42 cents?

A. I don't think so.

Q. Upon what theory do you allow that to remain?

A. It is a customary charge in the repair of stoves in all the experience I have had in the gas business.

Q. You have "Actual replacements, 2.12"?

A. Yes, sir.

Q. Where did you get that figure from?

A. That is the actual amount expended for replacements during that year and it is included in the 10 cents per thousand. That is to say it will be closed into the 10 cents a thousand at the end of the year with all the actual replacements.

Q. Have you got the paper from which you testified with regard to construction work at Astoria amounting to $2,528,000?

A. Yes, sir.

Q. Will you let me look at it please?

A. $2,582,000, it is. (Handing paper to Mr. Burr.)

Q. Do you agree with the statement of Mr. Mayer who testified here that the more up-to-date the construction of gas plants is the cheaper the manufacture is as a result?

A. With certain qualifications, within certain limits.

Q. What qualifications, for instance?

A. Well, I think if you would limit this to a single case you might make comparisons between that particular case, but I don't think you can say that in general, comparing one point with another point. Provided you do not introduce any complications or situations it might remain the same. I mean to say it might be an improvement with modern apparatus, but the expenses that
1792 might be involved might offset al- the saving. And again,
if you have an old plant and you renew that plant on the same ground you have the original capital of the old plant plus the capital of the new plant, and it is a matter of computation as to whether there is any saving by putting in a modern plant in that location unless at the same time you have the ability to charge the old plant off to depreciation so as not to unduly increase your capital.

Q. But as a matter of fact, to your knowledge the price of gas not only in the city of New York, but in all the large cities of the United States has steadily decreased, hasn't it?

A. Yes.

Q. The manufacture of gas is a progressive art, isn't it?

A. Within certain limits.

Q. It has immensely progressed since its introduction in this country some seventy-five years ago, hasn't it?

A. Oh, yes.

Q. Well is that diminishing in the price of gas due to the improvement in apparatus and plants?

A. I think it is primarily due to the process itself, up to date. The introduction of water gas in my judgment is what has made it possible to reduce the price of gas more than any other element.

Q. Does not increased consumption have something to do with the price?

A. Within certain limits, but that is a matter of local question. In some cases it does and in some cases it does not, apparently.

Q. What do you find the case to be here?

A. I think for a series of years it has remained fairly steady. There are some economies in some directions which are offset by expenses in other directions. Given a steady manufacture and an increased business for the same plant in the way of meters and mains
I should say it would be apt to decrease it, but when you have
1793 to build a large plant in order to meet that demand it would
not necessarily affect the situation.

Q. Speaking of mains, when you took charge of the Consolidated did you ascertain the condition of the mains in the streets?

A. Yes, in conversation with the superintendent of mains. I had a general conversation, but I did not dig up any in the streets to ascertain their conditon.

Q. Have you ever made any personal examination of any of the mains?

A. Only as I see excavations, I generally look to see what is in the hole, and I very frequently see mains in that way.

Q. Did you ever see the mains that Mr. Simpson thought he detected some evidences of electrolysis in?

A. No, I didn't see that.

Q. Did you ever see a map showing the mains of the constituent companies in 1884?

A. No. I may have seen it, Mr. Burr, but it is not in my mind.

Q. Have you ever kept track of the abandoned mains?

A. No.

Q. Do you know of any person who has any information upon the question of abandoned mains, abandoned by the Consolidated Gas Company?

A. Only so far as Mr. Simpson has testified. I cannot add to that.

Q. Is there a map showing the mains and their sizes in every street in the City of New York?

A. Yes, sir, I believe there is. When I say map, I mean a map in a general sense, I do not mean it in the singular sense.

Mr. BURR: Well, it is singular we have never been able to see it; that is the only singularity I have observed.

Q. Now, this item of $300,000 for dwellings for the company's
employees at Astoria? Does that contemplate the erection
1794 of hospitals and schools and kindergartens?
A. That has not crossed my mind yet. I have not gotten as far as that up to date. I have only considered the housing of the men to get them to the works. It is a matter which is pressing on us now and has been brought up a number of times in the last two months.

Q. Is there in your mind any pressing necessity for the construction of dwellings for the company's employees, requiring the expenditure of $300,000, having in mind the fact that the first unit is only now constructed?

A. I have not given that sufficient, careful thought as to the exact number of employees and the price per dwelling or the price per unit of housing them, so I would not like to testify specifically on that. There is a pressing demand definitely for some construction for our future employees under present conditions, in the vicinity of our works.

Q. That is, at some time in the future?

A. It is pressing now.

Q. You may erect model dwelling houses for your employees?

A. I don't know about model dwelling houses, but certainly if we do anything we will make them as perfect as we can afford to make them to keep up to the times, to give them accommodations such as other people would give.

Q. Well, no plans have been drawn for these buildings?

A. No, the plans have not been drawn.

Q. It is a hope and an aspiration?

A. No, it is more than that, it is a necessity.

Q. What do you mean by the rope hauling system?

A. I explained I did not recall directly in my direct-examination by Mr. Mathewson. I will have to plead a certain amount of ignorance upon that point. It has escaped my memory. It is not a large item.

1795 Q. How much would you deduct from this summary of data in the amount of $2,582,000, as being wholly and entirely unnecessary to be taken into consideration at the present time?

A. I would not deduct any of it from that point of view, not wholly unnecessary, but I should say specifically that I hope there will be no by-product plant built, that is $300,000, I hope we won't have to spend $300,000 for the dwellings of our employees. The fifteen million foot holder I am afraid will be a necessity; it will be a matter of reasonable precaution, in running the works to have a second holder.

Q. Have you adopted that plan of a second holder in the Borough of Manhattan?

A. I don't think there is any station that has not more than one or two holders, I do not recall any.

Q. Well, I mean to say is it a duplication of the holders by reason of the possible necessity for the extra holders used in the Borough of Manhattan?

A. Why, undoubtedly. I don't know what was in the mind of the engineer, but there cannot be a question in my mind that that was in the mind of the engineer.

The scows and tugs for transferring coke, $500,000. That system is an absolute necessity. You have got to get the coke over to New York and handle it in a modern way.

Q. Does that mean the wiping out of the National Coke & Coal Company?

A. Not at all. The National Coke & Coal Company will do all this work and it will necessitate their spending a large sum of money for horses and carts in addition. If the gas company handled it, the gas company would have to expend money for carts and horses and stable room.

Q. You mean it will require further advances on the part of the Consolidated Gas Company to that company?

A. For construction, yes. If they are going to do it they have got to have more money to do it with. And you cannot do it out of the present facilities.

1796 Q. This by-product plant is something new, isn't it?

A. It is for ammonia and tar.

Q. The idea I suppose is to extract every possible pound or gallon of ammonia and tar in the process of making gas at Astoria?

A. The idea is to extract every particle of the ammonia, I mean the apparatus in the works extracts every article of ammonia it can from the gas, and then that is in the shape of ammoniacal liquor of varying strengths and from that sulphate of ammonia is made. We sell it as ammoniacal liquor on the basis of a certain price per pound of sulphate. As far as the tar is concerned the object is to make as little tar as possible and then get as large a price for it as we can.

Q. The idea for this new plant would be to utilize the utmost out of your residuals?

A. Oh, yes. As a matter of fact, the larger amount of residuals you have for sale the less the tendency is to pay the price, a reasonable price, for those residuals.

Q. That would have a tendency to reduce the cost of gas, wouldn't it?

A. Certainly. The more for residuals you get the more it reduces the cost of gas.

Q. And those would enable you to do the work the company now has contracts with the Barrett Company and other companies to do?

A. Well, that would enable us to turn it into a raw product, which then would have to be placed on the market, and that the Barrett people do at the present time, but after we have turned it into the raw product we have got to sell it.

Q. Will you explain a little more in detail the difference between oil Baume 28 degrees and oil Baume 34 degrees?

A. Simply one has more lighter products, volatile products in it, than the other.

Q. And what specific purpose is the lesser degree of oil used for in preference to the greater degree?

1797 A. Never used in preference. The higher gravity of oil we can get the better we like it, within certain limits; it is a question of price.

Q. And you take 28 degree oil because you cannot get 34?

A. Well, it is the cheapest and as long as we can handle it with the fewer number of gallons to reach the consumer with the given candle power we prefer to use the cheapest grade.

Q. Are you familiar with prices paid for oil in the large cities of the State of New York?

A. I examined the returns from Brown's directory, but I don't know their accuracy.

Q. What is Brown's directory?

A. It is a directory of all the gas companies in the country, with information as to their officers as well.

Q. It is a recognized trade publication is it?

A. Yes; published by the publisher of *Progressive Age* in New York city; a capable man.

Q. And is *Progressive Age* a progressive gas paper? Is it devoted entirely to the interests and the information of those interested in gas works?

A. It has a great many articles on gas in it.

Q. Now you say you sought to obtain a low price for this oil. Can you state any person that you had any dealings with for that purpose other than the Standard Oil Company?

A. No, sir; I cannot.

Q. You are acquainted with Mr. Mayer, who testified here?

A. Yes, sir.

Q. Is he now in the employ of the Consolidated Gas Company?

A. Yes, sir; for the specific purpose involved in this hearing.

Q. I ask you is he now. His labors are finished, I understand?

A. Yes, sir; entirely.

Q. And Bartlett, Hayward & Company are building the first unit at Astoria of the plant there?

A. No, sir; they are building a certain part.

1798 Q. When you said that in your efforts to get a favorable contract for your oil, that the chief engineer advised you he needed a better grade of oil, did you refer to Mr. Bradley?

A. I did.

Q. Did he say what he needed a better grade of oil for?

A. Yes, on account of candle power, maintaining candle power.

Q. Did he say why the oil previously used was inferior for his purposes?

A. On account of maintaining candle power, yes.

Q. What was the oil that you had been using prior?

A. 28 degrees gravity, or thereabouts.

Q. And not 34?

A. Not 34. When I say that I say that practically there was some 34 used, but a very small quantity.

Q. Well, how small?

A. I do not recall the exact number of thousand gallons.

Q. Would you say million gallons?

A. Or million gallons, either.

Q. Was this your first venture into the oil regions?

A. Will you put that question a little plainer.

Q. Had you ever bought oil for any gas company before?

A. I do not think I ever made a contract ebfore that contract.

Q. Were you familiar with the prices charged in other cities for oil?

A. I have been familiar with the prices in the cities in which I was employed, in Boston.

Q. What grade of oil do they use there?

A. I was trying to recall. 34 gravity, I think—32 or 34, as near as I can remember. They did use naphtha in the past years and they have used as high as 44 gravity in the past years.

Q. You did not buy any oil in Boston, as I understood you?

A. I don't think I ever made a contract, no, sir.

Q. Do you know what the prevailing rate for oil of this degree, 34, is in Boston to-day?

A. No, sir.

1799 Q. Now, do you know what the prevailing rate to-day is for 28 degree Beaume?

A. No, sir.

Q. Are the companies in Boston coal or water gas plants?

A. The Consolidated Gas Company of Boston is both coal and water gas, the New England Gas and Coke Company is entirely coal gas.

Q. You testified at an investigation into the workings of those companies a little while ago, did you not?

A. Yes, I did.

Q. Your estimate of the cost of gas as given by you, is based upon all the items embraced in Exhibit No. 94, I understood you to say?

A. Everything on that paper is not on Exhibit No. 94, because it has reference to some of the repairs and renewals in previous years, but the basic figures are obtained from Exhibit No. 94.

Q. And the figure that you give in this statement which has been spread upon the record, 69.36 cents, is in your estimation the cost of gas per thousand cubic feet at the burners?

A. That is the price that should be allowed as the cost of gas in 1905 at the burners, based on sales.

Q. If I understand this paper rightly, you claim that the profit which is derived by the company from that figure would be what?

A. Are you figuring on 80 cent gas or dollar gas?

Q. I am figuring on 80 cent gas.

A. Well, the gross amount applicable to dividends would be 6.69; fixed charges, 7.32.

Q. Well, do you mean that this being the cost of a thousand cubic feet of gas at 80 cents, it leaves a remainder applicable to dividends upon the capitalization of the company of 6.69?

A. After paying the fixed charges on the debentures.

Q. After paying all the fixed charges?

A. Yes, sir.

Q. 6.69 cents per thousand cubic feet?

A. Yes.

1800 Q. You have not been able to figure out in anyway, from your examination of the business of this company or the figures that have been produced here, that an 80 cent rate forces you to manufacture gas without any profit whatever, have you?

A. No, sir.

Mr. **Mathewson**: We would shrink from such an effort.

Mr. **Burr**: You may be retiring.

Mr. **Mathewson**: Not yet.

Q. Your attention was called to the pressure clause of the law, and I understood you to say that it was not possible to comply with the terms of the provision of the law in that regard?

A. I said my judgment was that it would be practically impossible to comply with the provisions of the law.

Q. Have you ever tried to comply with them?

A. Yes, sir.

Q. You have had a great deal of experience, I presume, in regard to pressure?

A. Yes, I think I have.

Q. In any other city than Boston?

A. No, I never ran a works except in Boston.

Q. Is it true that the greater the pressure the greater the consumption of gas?

A. No, I cannot say yes to that statement.

Q. Then you disagree with Mr. Bradley?

A. I do not know whether Mr. Bradley testified to that or not, but I cannot say as a law that the greater the pressure the greater the consumption of gas, because I do not think it would need necessarily follow.

Q. What relation has the size of the mains to the pressure of gas?

A. I cannot answer that question intelligently. I am not quibbling, Mr. Burr, but I am just thinking of an answer.

1801 Q. In your judgment has it any relation? That is the point I am trying to get at. Has the size of the mains used in distributing gas, any relation to the pressure of the gas? It may be a simple question to answer and it may be extremely difficult; I do not know?

A. The best way I can answer that is that the size of the main is an element in the distribution of gas to which pressure has some relation. I do not think I can answer any better than that.

Q. As far as the amount of gas is concerned, for instance, you can send a greater amount of gas through a large main than you can through a smaller one.

A. Yes, under the same pressure.

Q. So therefore it has some relation to the pressure?

A. I did not say that it did not have any relation, but I thought I would qualify that one element.

Q. Is it possible to construe the law limiting the pressure of gas at from one to two and a half inches at sea level, by the usual scientific method, and add a half inch to this pressure for each one hundred feet rise?

Mr. Mathewson: I suggest that that is not a proper question. Whether it is possible to construe that is a matter perhaps of law rather than expert testimony. If there is any doubt about what it means, it is not for this witness to say.

Mr. Burr: I am asking him if that is not the usual scientific way of construing that law.

Mr. Mathewson: No, I do not think you asked him that.

The Master: Ask him anything you please about putting gas through pipes, but I do not see how he can be asked as a gas man as to any valid effect or construction to put upon a law.

1802 Mr. Page: He said he was familiar with the law, and that it was absolutely impossible to comply with the requirement of it.

The Master: Well, I will let him answer that question the best he can.

Q. Is it possible by limiting the pressure of gas at from 1 to 2½ inches at the sea level, by the usual scientific methods, to add a half inch to those pressures to each 100 feet rise, and comply with the requirements of the law in question?

The Master: That is all right.

Mr. Mathewson: I object to that again, as a conclusion.

The Master: I will let him answer it.

Mr. Mathewson: It is assuming that if he violates the law, will it be possible to comply with the law. That is virtually the question.

The Master: He may answer it.

Exception taken by Mr. Mathewson.

A. I cannot answer that question.

Q. Do you give it up?

A. No, I do not give it up by any manner of means. I would not give it up, but I cannot answer the question offhand on the stand.

Q. You mean to say that you would require some time to consider that?

A. My answer would naturally be no, that it was not possible to comply with the law even with that qualification; but I would not say that offhand on the stand. I would be very glad to consider the matter. As far as I am concerned I do not construe the law and never have, except as it appears on the face of it. For instance it says "at no place" and "no mains"—as a matter of fact, a service
main. Now, we have not any such term as "service main"
1803 in the gas business. That is the first place where the law is
very uncertain, but it says that in no service mains shall the pressure be less than 1 inch and more than 1½ inches at any distance from the works. Now, what "at any distance" means, I do not know whether it means a foot or some indefinite distance.

Mr. Burr: Well, the court will take care of that Mr. Addicks, because the law will be construed as a reasonable law, no doubt.

Mr. Mathewson: I wish it could be. Merely for information, did your question contemplate the result if the pressure specified by law should be taken as applying to sea level, and as being increased half an inch above the pressure specified by law for each additional elevation which you mentioned? Is that it?

Mr. Burr: Standing apart from the law, I have asked him the direct question.

The Witness: If there were 2½ inches pressure at the sea level, the East River at some point, and at 100 feet above that, it was, for pure coal gas, one inch more? Does it mean that we can carry, if that difference is one inch, does it mean that we can carry 3½ inches at that point, and 100 feet above that point 4½ inches, and 100 feet above that 5½ inches. That is the only thing I mean. I am speaking now of pure coal gas, where about 100 feet is one inch pressure. Unenriched coal gas as you get a higher gravity, it runs down.

Mr. Page: The question was about a half-inch.

The WITNESS: Take a half inch then; two and a half inches at sea level, three inches at 100 feet, three and a half inches for the next hundred feet and four inches at the next hundred feet 1804 and so on. If that is the proposition I do not see how it can be within one and two and a half inches at any distance from the works. I should be very glad to construe it that way, and it would certainly make the law easier if it could be construed that way. Whether it would be effective or not I would not like to say offhand.

Q. What was this average that you referred to in making up your computation of 10.89 for replacement?

A. The average replacement, 1895 to 1899, was 12.31. There is an exhibit in this case, I do not recall the number; and for the calendar year of 1905 it amounted to 7.34.

Q. You said something with regard to the average for the past twenty years.

A. No, I did not take that. Others have taken twenty years in those computations.

Q. You gave here a figure of 10.89.

A. I think that was about the figure for twenty years. Others have taken the whole twenty years. If we were manufacturing gas for the whole twenty years and not buying gas, I would be content to take that time, but as we were buying gas for some of that period, as for myself, I prefer to take the time we were manufacturing all our gas and compare it with that.

Q. You say you are familiar with the real estate of the company?

A. Yes, sir, I think I am perfectly familiar with it.

Q. Can you tell me where the company has vacant land not in use for gas manufacturing purposes?

A. I could call your attention to any plots and show you the use to which they are put.

Q. Have you made any diagrams showing the use that every parcel of property or real estate or land is put to by the Consolidated Gas Company?

A. I do not recall doing that.

Q. Is there such a diagram in existence? I mean showing 1805 at each particular plant where each particular building is located in that particular plot?

A. I cannot answer that yes or no.

Q. I call our attention to Exhibit 105 before the Gas Commission which was introduced in evidence here yesterday, which purported to be a statement of gas made for the Consolidated Gas Company by other companies, net, for the nominal year ending October 31, 1905. That statement shows month by month for the nominal year ending October 31st, 1905, the sales by each company to the Consolidated Gas Company with the price charged, which includes the ten per cent. addition to actual cost. I call your attention to the differences not only in the cost of the several companies, but the same companies for the several months of the year. For instance, the New Amsterdam, month of greatest cost is July, 39.66; month of least cost, December, 31.85. Standard, July, month of greatest cost, 35.31 month of least cost, May, 31.65. For the Mutual, month of greatest cost January, 41.60, month of least cost, October, 34.91. Central Union, greatest cost 34.43, October, month of least cost, June, 25.85. The increased percentage over lowest cost in the case of each company is as follows: New Amsterdam, 24 per cent., Standard 11½ per cent., Mutual, 19 per cent., Central Union 33 per cent.

Now, can you give any explanation as to the cause for variation between the prices of those companies?

A. No, except that in general, the price month by month is an uncertain thing. It not only depends upon the cost of labor and material, but it also depends on the amount of repairs to the plant. That has a bearing on the cost.

Q. The season of the year does not seem to be a factor, because one of the companies has its highest cost in the month of January, two others in the month of July, and the fourth in the month of October; while the least cost to one company is in the month 1806 of December, one other in the month of June, and still another, the month of October?

A. Of course you would have to have definitely the sales of that particular time in each company. As I said before, the quantity of repairs has a very great bearing. Of course normally if you had no repairs whatever and maintained the work in a normal way, year by year, with coal gas particularly, you would expect the highest cost in the summer, or higher cost in summer than you would in winter, normally. With water gas it is not so noticeable, ordinarily, except for the repairs, because the total labor is not a very large item. It would have to be that the increase of sales or output of the works would offset the increased cost in winter, and it might be that repairs were delayed, material might not have been received in summer; it might have been delayed until November or December. I cannot tell without considering each company.

Q. Can you give any explanation of the fact appearing on this exhibit that the Consolidated Gas Company buys three times as much from the Mutual Company as it does from the Central Union, although the cost to the former company is 30 per cent. greater than the latter, and buys five times as much from the New Amsterdam Company as it does from the Standard, although the cost is five per cent. less?

A. As far as the Central Union is concerned, it would buy no more gas than was necessary in Central Union territory. As far as the other companies are concerned, it would undoubtedly buy from the company that was able to supply it.

Mr. Mathewson: The Mutual does not operate in Central Union Territory, Mr. Burr, nor does any of these other companies.

1807 The Witness: None of them at all.

Mr. Mathewson: That merely relates to public lamps maintained in the Bronx. The Central Union gas is obtained for that; there is no other place to get it.

Mr. Burr: I think it is in evidence here, Mr. Mathewson, the actual sales per active meter?

Mr. Mathewson: Yes, that appears.

Q. Are you selling more gas this year than you did last year?

A. I am a little in doubt whether we are selling a little bit less or a little bit more. Some months I remember we have sold less. Month before last we had a material gain, evidently on account of the very dark weather we had during one month.

Q. Are you buying more gas this year than you did last year?

A. I have not got that figure in my mind.

Q. Is it not a fact that by the statements produced by your company before the Senate Investigating Committee, the cost of manufacturing gas in 1904 appeared to be 39.27 per thousand cubic feet?

A. I cannot remember that far back. It is a question of whether it is make or sales, or including that bought or made, or whatever it may be.

Q. Does it appear from Exhibit No. 94 in this case that the cost of manufacturing gas in 1904 was 32.42 cents per thousand cubic feet?

Mr. Mathewson: At what point, at station cost or in the holder?

Mr. Burr: Station cost.

A. That appears to be the figure at station cost, gas made, Consolidated Gas Company's own works, 32.42.

1808 Q. To what change of conditions do you attribute your
ability to manufacture at over 17 per cent. less cost in 1905
as compared with 1904?

Mr. Mathewson: Now, just a minute. There is no evidence here that in 1904 they manufactured at 39 cents. The witness is asked a question here as to whether that was not so, and he says he cannot say, and he does not know whether if there was such a figure it was based on make, or sales, or what not. I submit that there is no foundation for the question, and I object to it.

Mr. Burr: I understood the Master to make a ruling here long ago that all the statements in the pleadings and affidavits were before you, part of it being that the answers of the City of New York is the report of the Stevens Investigating Committee. By that report it appears that in 1904 the cost of manufacturing gas was the figure I have stated.

Mr. Mathewson: I would like to see the report to see whether it relates to sales or what it does relate to.

The Master: I suppose Mr. Mathewson's point is that that does not prove it to be the fact, the fact that it was reported by the Stevens Investigating Committee.

Mr. Burr: No, but these gentlemen can deny it if that is not correct. I asked for that figure for the purposes of comparison, as is plainly to be seen.

Mr. Mathewson: Let us supply the first figure first.

The Master: You can ask him, assuming that it appears in the
report of the Stevens Investigating Committee or elsewhere that they
manufactured gas at a certain price in 1904, how he can
1809 account for the fact that in 1905 it apparently cost a lower
price, and let him make the best explanation that he can that
covers that point.

Mr. Burr: Thank you, I will adopt the suggestion.

(The remarks of the Master were repeated to the witness, after which Mr. Burr put the following revised question.)

By Mr. **Burr**:

Q. Assuming that it appears in the testimony before the Senate Investigating Committee that the cost of manufacturing gas in 1904 was 39.27 cents per thousand cubic feet and you knowing the fact to be as it appears by your Exhibit 94 at this hearing that the cost of manufacturing gas was 32.45 cents a thousand cubic feet in 1905, can you tell me to what changed conditions you attribute your ability to manufacture at over 17 per cent. less cost in 1905 as compared with 1904?

Mr. **Mathewson**: I object to the question as not proper.

Objection overruled; exception.

A. I could not tell without comparing item by item, Mr. Burr, as to what to attribute it to.

Q. Calling your special attention to that data and those figures, would you be kind enough to investigate it so that you may be able to answer it to-morrow?

Mr. **Mathewson**: I do not think the witness will have a chance to do that, Mr. Burr. It is a good deal of a question, involving a great many elements.

1810 A. I would be perfectly glad to suggest things that might bear on it, and it would be a question in my mind of cost of labor and material and any increase in efficiency in the work. That is all I could see that I could look for. It varies from year to year and from time to time, so that is the reason I figured on 10 cents.

Q. What I would like to know is whether that difference in the price was due to the increased production at a lower cost for material, labor and expenses, or in the saving of a greater percentage of the gas made, it appearing that the cost of material, labor and expenses in 1904 was $3,528,901.55 for an output of 8,984,550,000 cubic feet and the cost of the same in 1905 was $3,455,091.37 for an output of 10,657,810,000 cubic feet, as shown by Exhibit 94?

A. Is that manufactured gas or is that sold gas? These figures you have called my attention to, or the one that is here, is based on the cost of gas made, not sold.

The **Master**: When you say here, you mean what exhibit?

The **Witness**: In Complainant's Exhibit 94. Now, if there is any reference to sales in any of those figures, it would not apply to this figure referred to. So far as two works are concerned, a works that is smaller than another works may make gas cheaper than one that is larger. So that it would require analysis in each case.

Q. As a matter of fact, you made more gas in 1905 than ever before in the history of the Consolidated Gas Company, is not that so?

A. I would not like to answer that offhand, Mr. Burr. I have not those figures in my mind. I have had no occasion to use them, therefore, I have not them in my mind. I could remember it. I could say what gas we sold in 1905, Mr. Burr. I have that figure.

1811 Q. Now, in the affidavit made by you you state that about four-fifths of the present generating capacity of the Consolidated Gas Company are in the shape of modern up-to-date water gas plants, which could not be improved upon anywhere and that the remaining one-fifth are coal gas plants which are efficient and in shape to operate for an indefinite period without inpairment of efficiency?

A. Yes, sir, I think that statement is absolutely correct.

Q. And you heard Mr. Mayer testify?

A. I heard Mr. Mayer testify, yes, sir.

Q. And you agree with Mr. Bradley, the engineer, in the statement made by him in his affidavit, that all the manufacturing plants are kept at a high state of efficiency and during the past year they produced more gas and at a lower cost than ever before in the history of the company?

A. I agree with the first statement, that they have produced more gas, Mr. Bradley states, and I would accept Mr. Bradley's statement for that, that it was the largest amount of gas made.

Q. Then there is no reason to believe that the value of your manufacturing plants will depreciate so long as it is kept in its present condition of use?

A. Except for supersession.

Q. What do you mean by supersession?

A. Superseded by some other plant, and the final renewals that any plant must need. It may be—take a plant in a perfectly good condition, I cannot say that there may not something happen to that portion of the plant, the whole thing may blow up and there would be an expense of hundreds of thousands of dollars.

Q. In setting aside 10 cents per thousand cubic feet of gas sold, hasn't your company intended to provide for all necessary cost of ordinary as well as extraordinary renewals, replacements and repairs?

A. Ordinary?

1812 Q. All necessary cost of ordinary as well as extraordinary renewals, replacements and repairs.

A. That is in addition to ordinary repairs?

Q. Yes.

A. But it includes renewals but not repairs. You have to make a distinction between renewals and repairs. The current repairs are taken care of in the cost of gas, but the renewals are included in that 10 cents.

Q. That is renewals and replacements?

A. Renewals and replacements, allowing 2.12 cents in this particular case. Of course I will add, too, that if there is a variation in the cost of repairs—I have shown here in this item as between the repairs for the calendar year a difference of 4.62 cents. I should consider personally that 10 cents would cover that or would be part of that difference, and the actual replacements?

Q. Well, as a matter of fact, there will not be any actual depreciation in the value of your plant until it is dismantled or removed to Astoria, or a portion of it sold for scrap?

A. Not necessarily, it may be superseded at any time, I cannot say when. I don't know what will develop in the gas business to cause supersession.

Q. Have you in mind any supersession other than that contemplated by the removal of the plant to Astoria?

A. No, none that would be probably installed in that same place; in other words, the cost of installation plus the original cost would be greater than would pay to make the change.

At 5:10 adjourned to 11 o'clock Friday, September 7th, 1906.

Last Exhibits:

City's 44.

1813 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, FRIDAY, *September 7th,* 1906—11 o'clock a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Garver, Mr. Burr, Mr. Page, Mr. Gans, Mr. Kirby.

1814 WALTER R. ADDICKS, being further examined, testified as follows:

Cross-examination by Mr. BURR (continued):

The WITNESS: I would like to make a correction in my testimony yesterday.

Q. What page of the record?

A. I do not recall the page. It was a question about electrolysis that you asked me.

By Mr. MATHEWSON:

Q. He asked you if you had seen the mains which Mr. Simpson testified as having pitted with electrolysis.

A. Yes, the question covers the general question of electrolysis, not specific in any case. I had in mind the case of some electrolysis that occurred about Spring Street, I think it was. As a matter of fact, there was a case of electrolysis about the Brooklyn Bridge, which he also testified to. A sample of that part was taken up and submitted to me, and I had forgotten it at the moment. In accordance with that, I called upon the Brooklyn Railway people to investigate that question in connection with electrolysis at the Brooklyn Bridge, after I saw that piece of pipe; I did not recall it at the time.

The MASTER: Page 1793 is the page on which occurs the statement which the witness corrects.

A. Further, regarding capacity, I stated that the Standard was eleven millions. I understand that it is rated at ten millions, instead of eleven millions, although it has made an excess of ten millions. As regards the Mutual, I said that I had never been in
1815 the Mutual works since I have been in New York in connection with the Consolidated Gas Company. Mr. Bradley has given the capacity as twelve millions, and I will have to take his figures as regards capacity, for I merely learned it from him. I also gave the Central Union 7,500,000 feet. That was correct. Mr. Bradley originally gave it as 9,000,000, and that is the sum of the capacity of water and coal gas, but 7,500,000 is all that it can handle through the works in its entirety.

Q. What would that make your total for the capacity of the other companies in Manhattan, including the Central Union?

A. Taking 30,000,000 for the New Amsterdam, 12,000,000 for the Mutual, 10,000,000 for the Standard, 7,500,000 for the Central Union—59,500,000.

By the way, I omitted entirely the Northern Union. There is half a million capacity there.

By Mr. PAGE:

Q. But they do not manufacture?

A. They do not manufacture. On capacity the total makes 59,500,000.

By Mr. MATHEWSON:

Q. Exclusive of the Northern Union?

A. Exclusive of the Northern Union.

By Mr. PAGE:

Q. Then you have the Equitable plant lying idle; can you figure that up?

A. That is another plant that I do not remember going into. The plant was shut down.

By Mr. MATHEWSON:

Q. That is not a plant that could be operated to manufacture gas with any economy, the old Equitable plant, is it?

1816 A. It is a retort process, of using oil in retorts, and except for enriching coal gas, we are not using that process to-day. We are using the cupola generator types.

By Mr. Burr:

Q. So that you have not included the Equitable in that calculation?

A. No, sir.

Q. Can you state now what the capacity of the Equitable is?

A. No, sir.

Q. So that to the total which you have given now must be added the capacity of the Equitable?

A. The Equitable has been shut down for so many years that I do not know what condition it is in to manufacture. It might be on a par in some respects with 111th Street, but I do not know.

Mr. Mathewson: The testimony in the New Amsterdam case before the Gas Commission was that it was dismantled and wholly unfit for use.

By Mr. Burr:

Q. Now, is it not a fact that there is nothing to prevent you to-day, or next month, or in the current at any time, from disposing of your holdings in the Edison Electric Light Company?

Mr. Mathewson: I object to that as immaterial and irrelevant.

The Master: How is it, Mr. Burr?

Mr. Burr: I want to show that the situation is just about the same with the Edison Company as it is with the Astoria Light, Heat & Power Company. They own all of the stock of each company. Now, certainly there is nothing to prevent—and I want to get it on the record by an officer of the company—there is nothing to 1817 prevent the Consolidated Gas Company from disposing of its holdings in the Edison Company, in which it owns all the stock, and there is nothing to prevent it from disposing to-morrow, or the day after final judgment in this case, of all its holdings in the Astoria Light, Heat & Power Company.

Mr. Mathewson: It does not own all the stock of the Electric Light Company, but I do not think that makes it material or immaterial.

Mr. Burr: In my view of this case—if your Honor would like my view—it is just as absurd to the cost of gas the construction of a plant in Astoria as it would be to charge the erection of a new electric light plant by the Edison Company against the cost of gas supplied and sold by the Consolidated Gas Company. That is the reason I want to get this fact on the record from an officer of the company, if he can say, that there is nothing to prevent his company from selling out to-morrow all its holdings in the Edison Company, nor is there anything to prevent them from selling out to-morrow all their holdings in the Astoria Light, Heat & Power Company.

The Master: Did anybody ever claim that there was?

Mr. Burr: I do not know; I want to know whether the company claims that there is any reason why they cannot.

The **Master**: He can answer it, if it is of any value.

Exception taken by Mr. Mathewson.

A. I do not think the officers would have any power to dispose of their plant, or their stock in any company.

Q. In the Edison Company?

A. No, I do not think the officers have that power.

1818 Q. Then your understanding is that the Consolidated Gas Company as a company has no power to dispose of the stock that it holds in the Edison Electric Light Company?

A. I do not think the officers would have that power; the stockholders might.

Q. In speaking of the officers, I speak of the company.

A. If you speak of the stockholders, I presume the stockholders have power to handle their property as they wish within the law. I do not know what the law is in the matter.

Q. Do you know why the Consolidated Gas Company did not construct these plants at Astoria itself?

A. No, I cannot say definitely why it did not. I do not know that they had any right to do it directly.

Q. Do you know if there is anything to prevent the Consolidated Gas Company from disposing of its holdings in the Astoria Light, Heat & Power Company?

A. I think my former answer would apply to that as well as to the Edison Company.

Q. I now ask you if there is anything that you know of to prevent the Consolidated Gas Company from disposing of its holdings in the Astoria Light, Heat & Power Company?

A. The officers of the company I do not think could do it; I think the stockholders would have to do it.

Q. In making up this statement which has been presented here, net for the calendar year, 69.36 per thousand feet of gas, did you take into consideration the increased cost, or the so-claimed increased cost, by reason of the additional candle power provided for by the law in question here in this case?

A. Yes, I have taken that into consideration.

Q. And what do you claim is the increase that has been necessary in the case of a thousand cubic feet of gas by reason of that extra two candle power? In other words, by reason of your compliance with the law?

A. 1.83 cents per thousand.

1819 Q. Can you give us the method by which you arrived, or the computation by which you arrived at that figure?

A. Yes. I figure that the additional oil would have amounted to .14 cents a gallon for the full candle power for the entire year.

Q. Is that for two candle power or one?

A. That is for meeting the law; and I figure that the new price of oil under the new contract would be 4.52, while in the calender year it was 4.23 cents per gallon, which made a difference of .294. The total oil that would have been used therefore is 4.07, multiplied by .294 is 1.2 cents per gallon. The .14 at the average price of 4.73 was 59 cents, making a total of 1.79 cents per thousand, this being on the amount of gas made. Based on the sales, 1.79 becomes 1.83.

Q. Were the figures you have just given, from the paper which you read, prepared by you or were they prepared for the purpose by Mr. Carter?

A. No, those were prepared by me from the figures which were prepared by Mr. Carter.

Q. When you say .14 you refer to the two candles and not to one candle, do you not?

A. No, that is the additional amount of oil that would be required, from our figures.

Q. An increase from 20 to 22 candle power?

A. To cover the entire law for the entire year.

Q. By reason of the addition of the extra two candle power?

A. Yes, that is right.

Q. For six months of this year you had 20 candle power and for the other six months you had 22, and the average was 21 candles?

A. The average would have been 21 candles; that is, figuring it that way. But I did not do it by candle power, I did it by the quantity of oil used. I could not do it by candle power; it is a question of the amount of oil used for six months in order to meet the requirements of a 20 candle power law and for the other six months
1820 to meet the requirements of a 22 candle power law.

Q. Would the reports from stations of the Consolidated Gas Company for the months which have elapsed since the first of January and up to the present time show the increase if any caused by the extra 2 candle power?

A. I am not personally familiar with those reports. I do not think I have seen them more than once or twice in connection with this hearing, but they would show the quantities used, whatever they might be.

Q. Can you state, Mr. Addicks, what is the actual oil required for one candle power, in gallons?

A. Coal or water, Mr. Burr?

Q. Coal.

A. Coal gas?

Q. Yes.

A. I cannot recall distinctly. If I remember rightly, when naphtha was used it was half to three-quarters of a gallon to raise it from the normal gas which comes from the retorts to about 19 candles. I do not recall what it is for gas oil. They are different.

Q. Can you state it any more definitely with regard to water gas?

A. No, I usually state about 5 gallons for 25 candle power; it is a rough figure. The exact amount for a candle power I think would vary, depending upon what candle power the gas was from which you started.

By Mr. Page:

Q. Coal or water gas?

A. I am speaking of water gas now.

Q. The same would be true of coal gas?

A. Yes, I think if you start with 12 candle power or 15 candle power gas.

1821 By Mr. **Burr**:

Q. Before the State Gas Commission you were asked:

"Q. Have you made a computation so that you can say how much per thousand feet in your best judgment the additional cost will be, due to the additional use of oil?"

A. Yes, sir.

"Q. Will you state how much it is? A. 2.62 per thousand."

A. That is correct, sir.

Q. And you were asked this question:

"Q. What price of oil is that based on? A. Based on an increase in the price of oil of 6 per cent. and the use of 34 gravity oil during the six months, which would amount to about 40 per cent. of the oil used, 60 per cent. being the lower grade."

A. Yes, sir, I think that is correct.

Q. You were asked a further question:

"Q. Is that what you estimate as the increased cost due to the increase in candle power? A. The increased candle power is about one and one-half a gallon; the increased cost of oil is about the same, out of that 2.62."

A. I do not recall those exact figures as to the 2.62.

Q. Mr. Addicks, is it not a fact that the real maximum output of the Consolidated Gas Company is around the Christmas holidays?

A. Not necessarily. It may be anywhere from the first of November to the first of February, and I have known of maximum
1822 outputs being, if I remember correctly, in November. Not of the Consolidated Gas Company, but I say in some companies. It depends upon the combination of a very dark day and very cold weather or suddenly clearing up cold the following morning.

Q. Is not that an exceptional situation?

A. I don't think so. In old days it used to be about the 24th of December, it was the largest day of the year, but it is not true now; more frequently the seventh or eighth of January in my experience in gas companies. In reading some of the maximum makes, the other day, that indicates to some extent the variety of time. But as I said the make does not mean the maximum amount in the holders because we might lose some on the maximum in the holders.

Q. Could you without any great difficulty procure and present a statement showing the maximum output, say two days before last Christmas, of all these companies?

A. I could give it to you for the Consolidated Gas Company, perhaps, quite readily.

Q. It would not require much trouble?

A. I could give it to you for the Consolidated Gas Company very readily.

Q. I would like to have that.

A. The output of the 23d and 24th of December?

Q. Yes.

A. All right, sir. It just now occurs to me, Mr. Burr, that there might be a good deal of difficulty in that, as the amount of gas made under the agency agreements is based on the calculations of unaccounted-for gas of the other companies on the whole month; I don't know about the exact accuracy of the output of the Consolidated Gas Company for any particular day.

Q. Well, I will take it as accurately as you can procure it?

A. I will do that.

Q. And with any qualification that you desire to attach to it.

A. All right, I will do the best I can.

Q. In addition to that information you will be able to produce the average output for the year, will you? 1823

Mr. Mathewson: The average daily output? We have given the daily output per year, and if you will divide it by 365 you will get the average output. We ought not to be asked to do that. We might make a mistake.

Q. Well, will you give us what you claim is the average daily output of the Consolidated Gas Company?

A. I don't claim any average daily output. It has no meaning to me. I would never use it and could not see any occasion for using it.

Q. In the affidavit which you submitted in this case, Mr. Addicks, you give the daily capacity of the first unit at Astoria as 20,000,000 cubic feet. Now, is that the extreme actual limit?

A. That is the designed capacity of the works.

Q. How many retorts are there?

A. I don't remember, Mr. Burr?

Q. Do you know the size of the retorts?

A. No, I could not recall it from memory.

Q. Can you state what charge of bituminous coal is used per retort and how many distillations for each charge?

A. No, sir.

Q. Is a 15,000,000 cubic foot holder included in each unit?

A. There will be a 15,000,000 foot holder in the unit, and there is a 15,000,000 foot holder included in this particular unit and a tank for a second unit.

Q. Have you got the contract for the construction of the Astoria plant?

A. No, sir.

Q. Or the preliminary estimates of the engineer or engineers as to the cost of its construction?

A. No, sir.

Mr. Burr: That, I believe, has already been called for.

1824 Mr. Gans: Yes, I believe they are to be produced.

The Witness: I would say, Mr. Burr, right there, I have an estimate which I testified from before the Gas Commission. I have that estimate, but I don't know that it is a preliminary estimate. It is the one in which I testified about $13,096,000 as the value. I have that here with me, if you wish to look at it.

Q. Let us have it.

Mr. Mathewson: We have given the items of $13,134,000, and the difference between that and $13,096,000 only relates to slight additions.

The Witness: I can tell you now practically the additions. There was cement to the amount of some eighty or ninety thousand dollars, and there were added certain bridges to carry the pipes. The pipes originally were to go under ground between the retort house and exhauster house, and in connection with the closing of Winthrop Avenue we had to allow a space for a larger sewer for the City, and found such difficulty in getting our pipes across on account of the prospective sewer of the City, as well as our own sewers, that we carried them across on bridges, which raised the cost in that particular case.

Q. The statement which you made yesterday with regard to these various items of which you gave us the figures of estimated cost, were they based upon anything definite, any engineer's estimates, other than your own?

A. These estimates were based in part on actual contracts and part on what would be required, but a portion of those estimates were based upon actual contract given out for the work, to which was added an undistributed expense of 10 per cent.

1825 Q. Can you state briefly which part is represented by contract or what items are represented by contracts?

A. In part.

Q. Yes.

A. Do you mean from memory? I cannot from memory. I can refer to the notes, and possibly I can.

Q. Well, if you cannot we will not waste any time on it. Is it not your experience, Mr. Addicks, that a reduction in the price of gas is followed by an increase in consumption?

A. Not necessarily.

Q. I have asked you what your experience is?

A. Well, there was a reduction in the price of gas in Boston that was followed by a decreased sale.

Q. For how long?

A. That was during the competition, and not only that, there was a time when the Boston Gas Company reduced the price of gas, which was immediately followed by the introductions of Welsbach burners and the rapid spread of electric light, and the introduction of water gas resulted in the falling off of the output for a number of years. That was finally overcome, and a gradual increase of business set in. But later, when the Brookline Company came in competition, the Boston Company stood still for a long time; so those were the results of the decreased price of gas, and they did not result in an increased consumption necessarily.

Q. Assume a case where there is no competition and the price of gas is reduced, what has been your experience in this regard?

A. Well, in suburban companies, where the price of gas has been reduced radically, there has been a very large increase of gas, but that is not only due to the decrease in cost, but also due to the fact of a large increase in population.

Q. Are you familiar with the situation as it existed here in the years 1899 and 1900?

A. No, I am not.

1826 Q. When your business or your plants are removed to Astoria, they become the property of the Astoria Light, Heat & Power Company, don't they?

Mr. Mathewson: Is that not a matter of conclusion of law, Mr. Master? I think so, and I object to it.

The Master: It is a matter of speculation or prophecy.

Mr. Mathewson: And even law.

Mr. Burr: The fact is here undenied and undisputed that they own all the stock of the Astoria Light, Heat & Power Company, but the fact is equally undisputed that they propose to construct the plants over there, so I say is it not a fact that the plants constructed there upon this plant or place or at this point, will become the property of the Astoria Light, Heat & Power Company, of which, it is true, the Consolidated Gas Company owns all the stock. I want to ask him that, and want to base another question on his reply.

Q. Is not that so?

The Master: Well, I don't see how it is a proper question, Mr. Burr. If you could show that it was by virtue of some agreement, or possibly a present intention, but your question is so vague. What is to prevent their changing their minds about it, if they have an intention, and doing something else with it to-morrow?

Mr. Burr: Absolutely nothing to prevent it.

The Master: What is the use of encumbering this record with such matters as that? Get down to facts.

Mr. Mathewson: And we may consolidate the two companies bodily.

The Master: Yes, and somebody may bring an action to
1827 dissolve them and wind them up.

Mr. Burr: I am going to ask him, is it not a fact that whatever loss the Consolidated Gas Company suffers by reason of the removal of these plants to Astoria should be charged against the Astoria Light, Heat & Power Company, and not against the consumers of the Consolidated Gas Company.

The Master: But is not that all a matter of argument? It involves conclusions. I do not see how the witness can testify about that with any value to anybody.

Mr. Burr: Well, of course, I call his attention to it. I thought they were ready with explanations to all these things, as they have been with regard to so many other things. If he has no explanation, and it is a matter of argument, very good; I will let it remain that way.

The Master: That is the way it seems to me.

Mr. Burr: It is quite clear that the removal of these plants to Astoria will be of great advantage to the Astoria Light, Heat & Power Company.

Mr. Mathewson: Then why prove it, if it is clear already?

Mr. Burr: I think that is all I will ask Mr. Addicks now.

The Master: Now, Senator Page.

Mr. Mathewson: You will take till one o'clock, Senator?

Senator Page: I presume so. Is Mr. Addicks the witness you have been stating was the witness to come on and prove the price and cost of gas?

Mr. Mathewson: Well, you will have his testimony.

Mr. Page: I want to know. You stated when we started 1828 to cross-examine Mr. Carter that you did not want us to waste any time on that because you had another witness. I want to know if this is the witness.

Mr. Mathewson: He is one on that subject, as his testimony shows.

Cross-examination by Mr. Page:

Q. You stated, Mr. Addicks, that it was impossible to comply with the pressure provision of the law of 1906?

A. Yes, sir, I stated that was my judgment.

Q. And one of the difficulties was the fact that you did not understand the meaning of some of the terms used in the act.

A. No, I did not state that that was the reason, I simply said that there were those uncertainties in connection with the act, in connection with some reply I made to Mr. Burr; at least that is my memory of it.

Q. You stated, as a gas engineer and a practical gas operator, that there was no such thing as a service main?

A. I don't know of any such term, no, sir, as described as a service main.

Q. So, in the use of that term the Legislature was inapt in its efforts to express its intentions?

A. I think so.

Q. As a part of the distributing system of a gas company there are mains of various kinds, I suppose?

A. There are mains, yes, sir.

Q. What do you call those mains scientifically; give them their scientific description?

A. We call them mains.

Q. Are they called anything else, or subdivided in any way—do you have trunk mains?

A. Some call them trunk mains, and some call them transit mains; certain mains they call transit mains, and certain mains they call trunk mains, and they call them distributing mains.

1829 Q. A trunk main would be a main that would run between the works and the holder, or between the works and some distributing district, without takeoffs for service?

A. To my mind [illegible] would describe a trunk main. I don't know that it would to all engineers, but in speaking of a trunk main that would describe it to my mind. It would be a principal supply main, leading to some district or same holder station, and might or might not have any connections taken off of it, but it would be a large main.

Q. Now, the mains that are used for distribution of gas to the consumers, what is the technical and scientific term for them?

A. Simply street mains.

Q. Street mains?

A. I know of no other term specifically.

Q. None of the mains that I have now referred to would be denominated a service main?

A. None that I would recognize.

Q. As a part of the distributing system, however, of a gas company there is in connection with its street mains what are known as service pipes, aren't there?

A. Yes, sir, or services; either service pipes or services.

Q. And that is the property of the gas company?

A. Well, usually up to the street line, and some places beyond the street line it is the property of the owners of the property.

Q. You mean up to the house line, don't you?

A. Pardon me, I do mean the house line. I don't know that that applies in New York. We put in our services, and we hold the ownership of certain pipes inside the house. I don't know legally that we have any right to control them.

Q. I think you mean you hold them to the connection with the gas meters?

A. Yes, that is right; but in some other towns that is paid
1830 for by the consumer, and therefore is, of course, the consumer's property.

Q. But in New York, I believe, the gas company owns up to the meters?

A. Yes, they put it in in that sense.

Q. Now, these service pipes, which are called by gas engineers services, are of various sizes, are they not?

A. Yes.

Q. The provision in regard to regulation of pressure would be most important with reference to the consumer, wouldn't it?

A. Yes, although it does refer also, you remember, in connection with the city, it refers, I think, to the street lights as well.

Q. Are there these services running to the street lights?

A. Yes.

Q. The regulation of pressure was for the purpose of giving an equal flow of gas to the consumer at what was presumed to be a reasonable pressure, wasn't it?

A. I think you could probably testify better than I could on that, Senator. I assume that that was the purpose.

Q. You know the legislators never know what their intention is until the courts have told them afterwards what they did intend.

A. I could only assume that it is, although I have no doubt that was the idea.

Q. Now, will you state why it is impossible to maintain a pressure within the range of one and one-half inches at the meter of the consumer?

A. At the meter of the consumer?

Q. Yes, which is the end of the service pipe.

A. Variations in the demand of the consumer; variations in the atmospheric conditions; variations in the level; the complications under which the distribution system of a great city is involved; as to space in streets, subways, and the multiplicity of elements that we meet in the practical distribution of gas; all combined make
1831 it impossible in my judgment to comply with that law.

Q. Now, we will take up, first, your variation because of atmosphere. How much of a variation would that allow for, and how rapid would be the change in variation?

A. The change might be instantaneous, and might reach as much as seven-tenths of one inch pressure.

Q. What change in the condition of the atmosphere to which you now refer could cause an instantaneous change of pressure of 0.7 inch?

A. A sudden storm.

Q. What kind of a storm?

A. I would not like to characterize it as a cyclonic storm or what particular kind of storm it is.

Q. In your experience have you ever had such changes?

A. I think we had one within six months, the one I have in mind.

Q. When was that?

A. Within six months there was a storm where the variation of pressure was marked on the sheet I believe at a maximum of 0.7 inch.

Q. Where was that indicated?

A. On the registering pressure gauges.

Q. At the works?

A. No, we have quite a number. I don't know how many of the registering gauges indicated it. It is not unknown heretofore.

Q. Then you referred to the difference in elevation?

A. Yes, sir.

Q. What variation do you figure for that?

A. That depends somewhat upon the quality of the gas that is being distributed.

Q. Well, we will assume the quality of gas that the law requires you to deliver and that you manufacture for delivery in the City of New York?

A. Well, from memory that is somewhere in the vicinity of half an inch pressure. I don't remember the exact number of hundreds.

1832 Q. You say half inch pressure. What do you mean by that?

A. Why, for 100 foot rise.

Q. That is the rule for coal gas unenriched, isn't it?

A. No, it is one inch for coal gas unenriched. Every 10 feet practically of coal gas unenriched represents 0.1 inch pressure. Now it depends upon what the quality of the gas is, the proportion of water gas and coal gas, as to what exact amount of difference there is in pressure for each 100 feet. It is a variable quantity.

Q. Well, taking air as 1., coal gas is about 0.6, isn't it, and water gas about .52?

A. Well, taking—I hesitate to testify to this from memory; I like to testify exactly; but taking air as 1,000, coal gas unenriched would be somewhere about 420 or 450, carbureted water gas, plain and simple, would be somewhere in excess of 600, probably 650; pure naphtha gas would be in excess of one thousand. Now you may have a variation from——

Q. Pure water gas would be heavier than air?

A. No. 650 in relation to 1,000.

Q. You said in excess of 1,000, didn't you?

A. No, I said oil gas would be heavier than air.

Q. That would be a gas of very high candle power?

A. Yes, sir. It would probably be in excess of 50 or 60, possibly 70 candle power.

Q. There is a certain amount of friction in the delivery of gas through pipes, isn't there?

A. Yes, sir.

Q. In making this computation you allow for the direct rise of gas, do you not? I mean perpendicular rise, when you say that the pressure would increase by half?

A. Yes. You take a pipe and put it up at the top of this building, for instance, and for each one hundred feet of height you would observe a difference of pressure, which would be indicated on a pressure gauge.

1833 Q. If this pipe though was laid at a very oblique angle, so that in getting the rise of 100 feet you would pass it through a long length of pipe, the increase of pressure would not be nearly as great, would it, because it would be overcome somewhat by the friction?

A. Well, you are assuming two different things in that case, Senator. If you take a pipe that has gas in it under pressure running to the top of this house or running the distance from here to Harlem, given the same elevation, I would not expect to find any difference in those pressures until the point when you commenced to take gas off the main; the moment you take gas off the main then the question of the difference in pressure would appear and that would vary entirely with the length of main and the quantity of gas taken out.

Q. And that would tend to very materially reduce the pressure?

A. If you could govern——

Q. (Interrupting.) Given a pipe of main that is running for a considerable distance and at regular intervals of varying services from which gas is being drawn, the pressure would be reduced very materially, wouldn't it?

A. Yes, if you knew exactly what was being used you might offset one for the other.

Q. And do not gas engineers for that purpose always place their works if possible at sea level or at the lowest point of the town so as to take advantage of the increase of pressure by the rise of the mains?

A. No. My idea is more that they do that so as not to have to increase their holders and their holder pressure, in order to force it down, rather that than the other. That is, indirectly your reason might be so. If you are down at the lowest level you are getting the full value of that holder, whereas if you locate that same holder on top of the hill, you could not get any gas down at the bottom

1834 of your hill. Nobody would get any gas there at all.

Q. And likewise with a less holder pressure you could deliver gas at a greater distance by having a slight rise?

A. That is true, sir.

Q. With the exception of the northern end of Manhattan Island is not the topography of the City of New York ideal for gas delivery purposes?

A. No, I do not think it is ideal at all, Senator.

Q. As far as the altitude is concerned, if you have a steady rise to the centre and have your works situated at the water front?

A. There are certain parts of Manhattan Island that considering distribution, with the holders or works on each side, that present no difficulty.

Q. The section that has been referred to by Mr. Bradley is practically the section north of 110th Street to Spuyten Duyvil, from Morningside and Edgecombe Avenues over to the river?

A. I don't recall.

Q. Where the altitude is testified to be from 107 to 250 feet higher than the water?

A. I don't remember Mr. Bradley's testimony in detail, but I do know from personal knowledge that around the vicinity of Fort George and between there and 80th Street there is a very great difference in the altitude. I do not recognize the streets that you refer to.

Q. Well, there are sections of the city where the altitude is much higher than the other sections. Is it not possible to regulate the pressure by carrying a trunk main and establishing a distributing system and placing a district governor at the outlet of the trunk main?

A. We do at the present time run trunk mains to the various parts of the city, but we do not have the district governor.

Q. No, I know you don't, but isn't it done by gas engineers very frequently?

1835 A. I know of one case where they have a high pressure main. The city of St. Louis has a high pressure main and they have some district governors. It is a comparatively new installation, but they do not carry as low as two and one-half inch pressure.

Q. How about Detroit?

A. I am not familiar with Detroit.

Q. Do you know whether they have district governors in Chicago?

A. I don't know whether they have district governors or not. They probably have station governors.

Q. Do you know anything about Kansas City?

A. Oh, pardon me. That is a high pressure suburban distribution system in Chicago, but that is a surburban matter where fifteen or twenty pounds pressure may be carried on a main; that is not applicable to city use.

Q. Is that handled through district governors?

A. Yes, but that is not applicable to city use, the high pressure. That suburban pressure method is used in sparsely settled territories to quite a considerable extent throughout the United States.

Q. Don't you know that abroad, and in very many cities of this country, district governors are employed for the purpose of regulating the pressure?

A. I know there are places where district governors are employed in this country, the cases I have already stated. I have never been abroad, so I have not much knowledge except from reading.

Q. Well, I mean from your reading and study of these questions as an engineer in charge of one of the largest companies in the world?

A. I know district governors are used.

Q. And it is possible with a district governor to carry in the trunk main almost any pressure and deliver it to the distributing system at a very much reduced pressure, or a uniform pressure?

A. Not without the loss of candle power.

1836 Q. But it is possible—just leave out the candle power and everything else and confine yourself to the possibilities of delivering gas at a very high pressure in that trunk main and regulating it by a district governor to a uniform low pressure in distributing mains.

A. There are high pressure systems and governors which distribute gas at the pressure at which it is burned.

Q. It is a well known method of handling a distributing system of gas plants, known to gas engineers and in practical operation in many places?

A. In certain places.

Q. You have automatic governors at your various stations, have you not. I mean manufacturing stations, also at your various distributing stations?

A. We have governors at our distributing stations and some of our manufacturing stations to maintain an even pressure at the outlet of the governor.

Q. You know, don't you, that in all cities where there are great differences in the altitude that district governors are employed to regulate the pressure?

A. No, sir, I do not.

Q. To what extent have you studied the question of the regulation of pressure by governors or otherwise since this law was passed?

A. I have studied the effect by placing or causing to be placed through the engineer department a multiplicity of registering gauges through Manhattan Island, endeavoring to reach the limits required by this law. I have sent throughout the United States and had pressure gauges put on various systems throughout the United States to determine whether there are any companies in the United States who are approximating this law. Among others, some of the places where this high pressure distribution that you refer to is in use. I have also examined some data in regard to governors that 1837 are used for that purpose. I don't know that that completely covers the ground, but it does to some extent.

Q. These pressure gauges that you have put on throughout the city and that you have had applied to pipes or mains of other companies as you have testified in various cities is for the purpose merely of ascertaining what the pressure is?

A. Yes. Self-registering so that you have the pressure for the whole twenty-four hours.

Q. Did you take a pressure at widely distributed points at the same time?

A. Yes, sir, they are distributed all over Manhattan Island from the Battery to the end of Manhattan Island.

Q. And to what particular mains or pipes were they applied?

A. There are applied in various places; some inside; I guess nearly all of them from some services either in one of our properties or in some other building.

One of your questions suggests another point. Before we could get the gauges and put them in service, we had some three or four hundred men who took pressures every fifteen minutes, that is when the law was first passed, so you could, if you wanted, get quickly a bird's eye-view of what the situation was, by the use of these several hundred men to take the pressure; and we took pressures off street lamps throughout the whole city; if not simultaneously, we would take the pressure at 8.15, then at 8.30, and then at 8.45 and so on, but that was all supplemented by automatic registering gauges in order to determine the pressure.

Q. Now, as a practical problem, the most important thing to the consumer is that the gas should be delivered at a uniform pressure, or nearly uniform?

A. If it were possible, Senator, for a gas company to give a uniform pressure to every consumer at all times it would be an 1838 ideal condition and a very desirable condition, but it is not possible to do it.

Q. I presume you have preserved these charts, have you?

A. Yes, sir.

Q. Could you produce the chart, say for one simultaneous test, or such number of tests as would fairly show the conditions?

A. No, I could not.

Q. Why couldnt' you?

A. On account of the multiplicity of conditions throughout the whole city throughout the whole year.

Q. Well, by that I mean, you say you tried to take some uniform, that is, simultaneous tests throughout the city?

A. That was by the use of the men that I referred to on the first test. Now there are other registering gauges in service the same as the city has them in service in their testing stations. It is exactly the same thing as the city has only I think we have a great many more than the city has.

Q. Yours are at different points in the city, aren't they?

A. Well, I don't know how far apart. I think wherever we have testing stations with the city it would be the same things or very similar. It may be a question of different service and if there is any difficulty with that service or any more gas is used on one service than the other, it would show a different pressure, or might show a different pressure, not necessarily so.

Q. Have you tabulated the results obtained from these pressure tests throughout the city?

A. No, that would be an enormous undertaking.

Q. How did you then use them?

A. My observation of the way the pressure was running on each chart from time to time.

Q. Are they in any way tabulated so as to show the pressure, the variations of pressure at different parts of the city in different periods?

1839 A. I really can't say whether they are. The city has such tabulations in their testing stations.

Q. I understand then that all the use that you made of these very extensive [illegible] that you have taken, was once in a while to look at them?

A. No, I consulted very frequently with the engineering department, the department that had charge of that, and I looked over the figures.

Q. That matter then was under the charge and direction of Mr. Bradley, wasn't it?

A. Yes; I do not have directly charge of every department of the gas company, you understand, and familiar with every detail. I am not physically able to do that.

Q. I understand that of course. You took the matter up, talked the matter over with Mr. Bradley, and he would exhibit certain of these charts to you?

A. Yes, I would ask for them, and look over the charts and run over all of them and draw my own conclusions from them, irrespective of anyone else.

Q. These charts are in Mr. Bradley's possession, or in his department, are they?

A. In his department or under his control.

Q. And if there were any tabulations made he would have them, would he?

A. Yes.

Q. You testified that you made the oil contract in November, 1905?

A. I did, yes, sir.

Q. And that the reason that was made was because you required more of the 34 degree Beaume to be delivered than, under your construction of the contract, City's Exhibit 10, it was possible for you to obtain?

A. For that reason I took the question up?

Q. Yes.

A. Substantially that.

Q. Did you inquire to find out how much oil had been delivered under the contract, City's Exhibit 10, prior to going into negotiations for the new contract?

A. For the current year I did, yes, sir.

1840 Q. You stated, I believe, that you thought it would be necessary for you to have, and therefore you provided for, 18,000,000 gallons?

A. No, sir.

Q. To be delivered within certain periods?

A. No, sir.

Q. This is the question that was asked you:

"Q. What provision? A. Why, in regard to 18,000,000 gallons.

"Q. Just state it? A. The result of that was that this paragraph was put in:

In the event of your requirements, November 1st, 1905, to March 31st, 1906, being for a greater quantity of 34 gravity oil than 18,000,000 gallons, we are to have the privilege of substituting for such excess oil of lower gravity than 34 degrees, but not lower than 28 degrees."

A. That is correct; only for that one year.

Q. Yes; then you estimated that it would be necessary for you to have the right to require the furnishing of 18,000,000 gallons between November 1st, 1905, and March 31st, 1906?

A. No, sir.

Q. For what purpose was that put in the contract?

A. I wanted all 34 degree oil, and the Standard Oil Company was in doubt as to whether they could possibly supply that, and they simply put that in as a matter for their safety. They said that they would make every effort to do it, but that they could not guarantee to deliver in excess of 18,000,000 gallons that year, because I came to them in November, and they said they could make no preparations for storage or furnishing that quantity of oil. The amount required, Senator, was much in excess of 18,000,000 gallons.

Q. For the use of the Consolidated Gas Company,

1841 A. For the uses of the company on Manhattan Island, including the Consolidated Gas Company; or, rather, in New York, which included the Consolidated Gas Company, and also the supplies for the New Amsterdam and Standard—the Central Union.

Q. You know, do you not, or did you not inquire at the time, as to how much oil had been delivered under City Exhibit No. 10?

A. Yes, I had at that time. I do not remember at this time what the figures were, I did know at that time. I looked into that matter.

Q. You knew that there had been 82,000,000 gallons of the 28 gravity oil delivered?

A. I do not recall the exact figures now, but I did investigate the question of deliveries of the 34 gravity and the 28 gravity for the year in question.

Q. In making that investigation you probably referred to the books that were produced here by Mr. Carter?

A. I think I asked Mr. Carter for the figures, that is my memory of it; but, however, I had the figures in some way.

Q. And that there had been only 7,000,000 of the 34 gravity oil delivered under that contract?

A. Well, I would not figure it that way. There may have been the 7,000,000, but as far as the quantity is concerned I would take it on the percentage of oil delivered through the year. The difference between that and 7,000,000 would be the difference between 28 degree and 34 degree oil for the entire year.

Q. I do not know that I quite catch your meaning there.

A. Suppose there were 80,000,000 to be delivered. Twenty-five per cent. of 80,000,000 would be one-fourth of 80 which would be 20,000,000 of one gravity, and the remainder of the other gravity. The difference of course would be the other. Now, if any portion of that 25 per cent. had been delivered, the difference between that and the 25 per cent. would give what was remaining.

1842 Q. Or to figure it in another way, you had a right to take 25 per cent. of 34 degrees Beaume and 75 per cent. of 28 degrees Beaume; and if you had taken the 25 per cent. of the 82,000,000 of 28 degree Beaume, you would be entitled to one-third of that amount in the 34 degree? That is, you would have had 27,000,000 gallons due you on that 34 degree oil?

A. The results would be—if 25 per cent. was 34 degree gravity; that would be 25,000,000 out of 100,000,000 that would be 34 gravity. Of course, if you take that proportion of that 25 per cent. what that represents with reference to the 28 gravity, that would be one-third of the 28 gravity, but it would be 25 per cent. of the whole, and 25 per cent. of the whole would be 33 per cent. of the three-fourths.

Q. If deliveries had been made currently and in the proportions of the contract you would have received 82,000,000 gallons of 28 degree Beaume, and you would have received 27,000,000 gallons of the 34 degree Beaume.

A. I do not know what the figures are, but I will put it this way. If we were to receive currently, we were to receive 25 per cent. each month of 34 gravity and 75 per cent. of the 28 gravity.

Q. Now, we find as an actual fact that you had received about 90 per cent. of 28 degree and about 10 per cent. of 34 degree?

A. In other words, when we took the oil currently we used the lower price oil to the extreme that we could use it, and therefore during those months we did not use the 25 per cent. we had the right to call for. We used the full of the lower gravity oil, which made the lowest priced gas.

Q. That would be the way that you would naturally do it; in summer time you would use the larger amount of 28 degree and in winter time a larger amount in proportion of 34 degree?

A. It depends upon your contract, and what rights you have under your contract.

Q. Irrespective of what rights you have under your contract, if you were operating with two oils——

1843 A. (Interrupting.) There was no question at that time of 22 candle-power in connection with this other contract, this question of using 28 gravity oil. The question was at that time whether in the machines we could use 28 gravity oil. We had the right to call for some 34 degree gravity, so as to make a higher gravity oil. Now, this new contarct explicitly and thoroughly covered it, so that there could be no possibility of error or mistake in the reading of the contract. I covered that very thoroughly, that we should have a right to have 34 gravity oil during the specific months, which covered the winter months and also covered either side to some extent. The remainder of the time we had to take the 28 gravity oil.

Q. But I am calling your attention to the condition that you were in at the time you made that contract, after you had been advised by counsel that the contract allowed you to call for those proportions of deliveries currently?

A. That was month by month.

Q. The practical construction of that contract would have been that you could take 82,000,000 gallons of one kind of oil and 7,000,000 gallons of another kind. That would have been a practical construction of the contract as between your company and the Standard Oil Company?

A. As I remember the contract now, we had only the option to call, or we had the right to use 28 degree entirely under that.

By Mr. **Mathewson**:

Q. Seventy-five per cent. of the total number of gallons was to be 28 degree Beaume?

A. If taken currently.

By Mr. **Page**:

1844 Q. "You are to have the privilege of requiring deliveries from us of a quantity which shall not exceed 25 per cent. of the 177,000,000 gallons of gas oil, of gravity which shall not be below 34 degrees Beaume."

A. Yes, sir.

Q. "The balance of the 177,000,000 gallons shall be of gravity not below 28 degrees Beaume, or higher at our option."

A. That is right. Those deliveries were to be made currently; if we did not take our option to take any 34 gravity we had the right to use the cheaper grade oil, 28 degrees, for the entire period that we did it, provided we could do so and obey the law.

Q. Altogether you had only taken 89,000,000 gallons, when your contract called for 177,000,000, leaving 88,000,000 to come?

A. Our contract did not require us to take any of the 34 gravity oil.

Q. It did not require you to take it; it gave you the right to demand it?

A. Yes, if taken currently.

Q. Who was the counsel that advised you as to that construction of the contract?

A. I continually confer with counsel, Shearman and Sterling.

Q. Was there any arrangement made for an adjustment of the Company's yielding to the Standard Oil Company this right that they had to take a large quantity at a lower price?

A. I do not know what you are referring to.

Q. Why, there was still about 90,000,000 gallons of oil due on the contract, City's Exhibit 10, at a price of 4.04 for 28 degree and 4.62½ cents for 34 degree, and you made a contract agreeing to pay the Standard Oil Company 4.29 for 28 degree and 4.87½ for 34 degree?

A. We went to the Standard Oil Company; the Standard Oil Company did not come to us. I was compelled to go to them in connection with getting this higher grade of oil. I could not get 1845 the higher grade oil and I had to make arrangements in order to get it. And I made those arrangements to do it.

Q. When Mr. Gawtry, your predecessor, went to the Standard Oil Company to negotiate the contract, City's Exhibit No. 10, he got an allowance of some $119,000?

A. He got an allowance of $119,000?

Q. Yes, he got a better rate on undelivered portions of the contract than the contract called for.

A. I do not know about that. What I think you are referring to is the fact that we got through that one contract and commenced to use the heavier grade oil experimentally to see if we could use it, and all that we used of the heavier grade was made at a price at which we could use it; and that amount represents the difference in price of those two oils which we actually used. They were anxious for us to stop the use of 34 gravity, as there was a great shortage of it, and then for the first time we commenced using 28 degree, and for every gallon of 28 gravity oil we used we got a lower price for it. That is my understanding of the situation. I do not understand that there was any allowance of any kind.

Q. What about the 32 gravity oil?

A. 32 gravity?

Q. Could not that be used practically as well as 34 gravity?

A. 34 gravity is what we have used successfully, the kind we wanted.

Q. What did you use in Boston?

A. All the way from 34 to 44, as I remember it.

Q. 44 is naphtha, is it not?

A. No, naphtha is 60 and 62, and 78, high gasoline averages 78.

Q. Now, as I understand your testimony as to the cost of producing gas by the Consolidated Gas Company, you have taken Complainant's Exhibit 94 and you have made certain deductions and certain additions to offset the deductions; is that it?

1846 A. No, sir, not to offset the deductions. There are certain additions which added to the figures after the deductions were made, but they were not made for the purpose of offsetting the deductions.

Q. And you offered the result of that as the cost *of* the Consolidated Gas Company of making and distributing gas?

A. I offered that as the result of what should be allowed for the cost of gas for the calendar year 1905, as I stated.

Q. If your directors should ask you to let them know the cost of making gas, would you pursue that method?

A. If my directors were to ask me for the cost of gas in order to fix a rate at which they could figure the selling price, I would submit that table.

Q. Supposing your directors should ask you what it cost you to produce and deliver gas to the burners of the company, would you take Exhibit 94 and make those deductions and present that as the result?

A. If they asked me the current year's cost, or the month's cost, I would give them a statement of the labor and material that entered into the manufacturing cost of gas at that particular time, with whatever other charges appeared on the books in the way of depreciation during that period. It depends on for what purpose the directors would ask me for the figures whether it was a current matter or something to determine the fixing of a rate as to whether they could afford to do it.

Q. There is a wonderful fluctuation in the valuations of plants, whether it is for the purposes of taxation or whether it is to enter into computation as to cost of gas. Then, the question as to what it cost you to produce gas depends on the use that is to be made of the figures, is it?

A. No, not at all; it depends on the period on which you want to undertake to consider the cost.

1847 Q. Referring to the record before the Gas Commission, I find Exhibit 78A, to which I will call your attention, and in which there is set down with great detail a statement as to operation, which purports to be a monthly report, prepared upon a blank of the company giving the gas made, the average daily make, the total amount of coal used, gas made per ton, oil used for enricher, net make per ton, coke produced, percentage used, coke produced for sale, tar produced, coal used per hundred pounds of coke carbonized, amount of gas made per man, gas made per retort, and an infinite amount of detail. For what purpose was that report made?

A. I really do not know.

Mr. Mathewson: I do.

The Witness: I do not recognize the report at the moment.

Mr. Page: I am willing to concede that Brother Mathewson knows all these things.

Mr. Mathewson: It was made because you requested certain information made up for a certain month.

Mr. Page: No.

Mr. Mathewson: Yes.

Q. Did you ever see the reports on file in your company, of which this is a copy? Now we are getting to something which was not made up.

A. I do not recognize it.

Q. Turn to Exhibit No. 114, which relates to the operations of the water gas stations. You will see an entirely different set of details, but the same infinite detail as to the operation of a water gas plant?

A. I should say from looking at that that that was the engineer's report of the conditions existing at that plant, as to blast pressure and coalings, &c.

Q. But does not every gas company keep just exactly such records as that, to show what it costs to produce a thousand cubic feet of gas? 1848

A. They keep records so that they can be reported to the office.

Q. To the most minute detail?

A. They keep such records to be reported to the office, showing what labor and material enters into the cost of gas, so that the cost of gas can be calculated.

Q. If you were getting at the actual cost of gas to your company, we would go to these records, wouldn't we, to ascertain the results from these records?

A. No, we would ascertain the basic figures from which to determine the result.

Q. You would ascertain your basic figures here?

A. Yes, how many gallons of oil, how many pounds of coal and other materials used; all that would not necessarily include all the cost of gas.

Q. There is some man in your company that has these figures month by month and year by year down to the fractional part of a cent, is there not?

A. Mr. Carter has presented that already in our exhibits.

Q. Not Mr. Carter, but I say there is some man, is there not, that has all of these figures showing to the exact fraction of a cent what it costs you to produce gas day by day and month by month?

A. I cannot say what detail there may be.

Q. Does not every well managed gas company in the United States have such a set of records, so that you, as the man chiefly responsible, or the chief engineer, can turn to those records and see at a glance exactly what it cost you to produce gas?

A. I can only say that I did not have it in Boston.

Q. And you do not know whether they have it here, the Consolidated Gas Company?

A. I do not know in what detail.

Q. When you were to testify as to the cost of gas, didn't you inform yourself as to these details?

1849 A. Yes, I went over very carefully all those questions as to cost, in all these statements, and considered them.

Q. And as a result you deducted 10 cents from Exhibit 94 for contingent expenses, and you deducted 7 per cent. for fixed charges, and you deducted .48 for some taxes, and then you proceeded to add certain other things to make it come up to more than 74 cents?

A. No, I did not bring it up to more than 74 cents.

Mr. MATHEWSON: The statement submitted by the witness did not include fixed charges, you know, Senator; the computations he made here.

Mr. PAGE: He deducted fixed charges?

The WITNESS: I did.

Q. For the purpose of testifying here yesterday as to what it cost your company to produce gas and sell it, did you go through any computations based upon your station reports?

A. No, I took the records from the books.

Q. You took the exhibits that have been put in?

A. I took the books.

Q. You took a computation from the books, the exhibit that has been put in, Exhibit 94?

A. Yes.

Q. And assumed that to be correct?

A. Yes, I did.

Q. And your testimony as to the cost of gas is based entirely upon Exhibit 94 and not upon your knowledge of the exact conditions?

A. Well, I know the conditions of the company; I only take the books of the company; I cannot take any other figures, but the cost is shown by the books of the company.

Q. But you took computations from the books, which have been put in as Exhibit 94?

A. And certain other matters that I know of.

Q. You have had quite a large experience as a gas engineer 1850 and manufacturer of gas, haven't you?

A. Yes, I think I have.

Q. And you state that you did not keep a carbonizing sheet in your Boston works?

A. No, I did not say that. I had everything to the greatest detail, but we did not work it out in cents per thousand; that is the point.

Q. Exhibit 88-A?

A. No, the second one.

Q. That is 21st Street, Exhibit 114?

A. I do not want to talk at cross purposes, Senator, I am sure.

Q. Well, I ask you if you did not keep this in detail?

A. We kept everything in detail, in the most minute way. Perhaps I kept that in Boston more minutely than the majority of engineers. This is merely a question of quantity, and those quantities are kept very carefully.

Q. Which, multiplied by the price of units would give the result in dollars?

A. Yes, but the engineer is interested in maintaining the minimum amount of material used for a thousand cubic feet of gas and that is the thing which governs him in handling his work.

Q. Yes, but the managing director of the company is interested, isn't he, in seeing what it costs him to produce the article that he is selling?

A. He is not interested in the same detail and the secretary is interested in the details of his office; but the general officer is not interested in details of that sense, and the figures which we had of the cost of gas in Boston were not in greater detail than you have in this Exhibit 94.

Q. Yes, I do not doubt that.

A. That is the only thing that interests us in arriving at the cost of gas.

Here a recess was taken until 2 o'clock p. m.

1851 & 1852

After Recess.

At the request of Mr. Page, who stated that he has an important engagement elsewhere, and all parties consenting, an adjournment was taken until Monday, September 10, 1906, at 10:30 A. M.

Last Exhibits:

Complainant's 224.
State's U.
City's 44.

1853 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, MONDAY, *September* 10, 1906—10.30 a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Garver, Mr. Burr, Mr. Page, Mr. Kirby.

1854 WALTER R. ADDICKS, being further examined, testified as follows:

Cross-examination continued by Mr. PAGE:

Q. Mr. Addicks, taking up the statement which you read in evidence at page 1757, you deducted a certain amount for taxes, .48 of a cent?

A. Yes, sir.

Q. Will you tell me how that is made up?

A. Those are the taxes which have reference to the securities of other companies owned by the Consolidated Gas Company, but not involved in the gas making business.

Q. What was the amount?

A. The amount in dollars would be some fraction, approximately .48 of a cent, multiplied by the sales. I have not got the amount in dollars and cents at hand.

Mr. MATHEWSON: 47.6 was the exact figure, and he took .48. Mr. Carter testified to it. 13,283,163,767 feet was the amount of sales.

The WITNESS: Roughly, it is $63,758 and some cents. I took the nearest decimal.

Q. You included the two items on City Exhibit M, $5,257.48 and $57,965.39?

A. My figure multiplied out would be slightly in excess of the two figures mentioned $5,257.48 and $57,965.39. My figure amounted to $63,758.40, approximately. It is due probably to the difference in the hundredths part of the decimal.

Q. In this statement of the amount of the taxes in Exhibit 94 there was also $94,000 for accrued interest, wasn't there?

A. Wasn't it $70,000?

Q. $94,000 is my recollection.

Mr. MATHEWSON: $95,506.29.

1855 A. That would undoubtedly be the amount, that would substantially be the amount, Senator.

Q. Well, included in this item $965,843.88——

A. The total amount and part of the 7.32 cents?

Q. Yes.

A. Yes, there would be an item of taxes on securities owned by the company and also accrued interest on taxes.

Q. The $95,506.29 you did not deduct?

A. No, sir, I did not deduct that.

By Mr. Mathewson:

Q. No part of that accrued on these that have been deducted.

Mr. Page: I know that. Of course, our claim is that if you do not pay taxes and allow interest to accrue, that does not go into the cost of gas.

Mr. Mathewson: I understand.

Mr. Page: I wanted to know whether he has made that deduction as part of that statement.

Q. You have not taken out your repairs to gas stoves?

A. No, sir, but they appear in the statement. The return for it appears in the statement under miscellaneous income, 1.30.

Q. Of what is that miscellaneous income made up; have you got that?

A. Not in detail. It is all the miscellaneous income from the gas company, gas stoves, and includes returns from street lamps, and other items. I don't recollect the details.

Mr. Mathewson: Mr. Carter put in a statement Friday showing that in detail, Senator. It is all the miscellaneous income. That 1.3 cents is all the miscellaneous income, $172,000 and something over, of which $122,000 was the stove rents.

1856 The Witness: If I had realized you wanted the details of that I would have saved you a great deal of time and had it in dollars and cents as well as in cents per thousand.

Q. Having deducted the 10 cents per thousand cubic feet, which in Exhibit 94 is contingent expense, including renewals, you proceed then to add certain things. You add for repairs and renewals 4.62 cents?

A. Yes.

Q. What repairs are those?

A. Those are repairs and renewals from 1895 to 1900, I think I testified, which amounted to 12.31 cents per thousand.

Q. But you did not deduct from the total of Exhibit 94 the repairs that are set forth on that exhibit, did you?

A. Yes, sir, I think I did.

Q. Where?

A. 7.34 is the total for the calendar year. The repairs and renewals amount to 7.34 cents, and the difference between 12.31 cents and 7.34 cents gives 4.97 cents. That being the difference in the repairs and renewals, and for an average period of five years when the companies were making all their own gas, and the present time.

Q. Will you show on this memorandum which you read in evidence at page 1757 where you have made the deduction for the repairs which appear on exhibit 94?

A. Well, I have the net difference, the entire repairs amount to 7.34 for the calendar year and the repairs during this period amount to 12.31, as I have testified before. That leaves 4.97. Now I have deducted from that .35 of a cent, bringing 4.62 as the actual difference between repairs for the period from 1895 to 1899 and the calendar year 1905.

By the **Master**:

Q. Where does that .35 of a cent come in; what is that for?

1857 A. Certain repairs done on the machinery that was used in supplying gas to the Consolidated Gas Company by some subsidiary company. I am endeavoring to make a comparison here of a company making and selling its own gas. It is merely a matter of choice whether you take a twenty-year period or whether you take a period where they are making all their own gas. The twenty-year period covers the time when they are making and buying as well.

Q. Then, if I understand it correctly, the items for repairs and renewals, so far as Exhibit 94 is concerned, are included in this contingent item of 10 cents, which you deduct in the first instance in your present computation?

A. No, sir. The only thing that is included in the 10 cents are the actual replacements, which is 2.12 cents. That is, so far as that is concerned. I am speaking now of the 10 cents as a book charge, but extraordinary repairs due to the extraordinary wear and tear would certainly be considered in connection with the 10 cents.

By Mr. **Page**:

Q. How much less would that allowance have been if you had taken the last five years from 1900 to 1905?

A. I don't know. I did not make that comparison. They were not making all their own gas. That is the reason I took that comparison.

Q. Well, you are not making it to-day, are you?

A. That is very true, but we are going to make it, and because of the fact we are going to manufacture all our gas it is better to take that period. You remember, before the Gas Commission that was considered by the Commission as the fair period to take and I took that period on account of the views the Commission took. They thought the fairest way to make the comparison was at the time we were going to make our own gas with the time we were making our own gas. That is the reason I took that five years as our original proposition. I thought it was the fairest thing myself. 1858

Q. The portion of your plant that is going to be devoted to the excess that you now buy will be an absolutely new plant?

A. Yes, sir.

Q. And the plant that was in operation from 1895 to 1900 was an old plant, that had been in use for 20 years.

A. Well, it was not a new plant. I don't know how long any specific part was in use. I have no doubt some parts of the plant were used 20 years.

Q. That was prior to the rebuilding of your water gas station and putting in more modern apparatus?

A. That is true.

Q. Now this 1.83 cents, what do I understand that is for?

A. That is due to the 22 candle power oil as compared with the 20 candle power on which we were working before.

Q. Well, you commenced in July last or July, 1905, to supply the 22 candle power oil, did you not?

A. We did, yes, sir.

Q. Then in exhibit 94 the cost of complying with that law would be carried in in this 33.17 cent cost per thousand sold on a total station cost?

A. That is true.

Q. And your allowance is for what it would cost you additionally from January to the 1st of July, 1905?

A. On the question of the oil only.

Q. Allowing for the oil.

A. I will give it to you accurately again if you would like to have it. During the second six months on the high candle power there were required 4.07 gallons of oil. Now the first six months together with the second six months was only 3.93 gallons of oil used. I assume if we were running the entire year it would require .14 of a gallon more for the entire year to maintain the full candle power.

1859 By Mr. MATHEWSON:

Q. .14 of a gallon more per what?

A. Per thousand cubic feet. I am dealing with thousand cubic feet in each case. Now that .14 of a gallon multipled by the average cost of the oil, 4.23 cents per gallon, would be an addition of .59 cents per thousand cubic feet as the total cost of oil for the .14 of a gallon.

By Mr. PAGE:

Q. Well, that was to comply with the candle power requirement from the first of January to the first of July, 1905?

A. Yes, that was the calculation I was trying to make.

Q. Turn to Exhibit 93, which is for the nominal year of October 31st, and refers to the station cost. There you will find it costs you less to manufacture gas for the calendar year than it did for the nominal year, although you had proceeded under two months longer of the higher candle power, 33.70 as against 33.17. Now isn't it a fact——

A. Well, won't you let me answer that question.

Q. Yes, if there is any answer to it.

A. It is a fact, according to Exhibits 93 and 94, that the station cost for the calendar year 1905 is slightly less than the station cost for the nominal year ending October 31, 1905, although the cost of the oil for the calendar year 1905 is greater than that for the nominal year 1905.

By the **Master**:

Q. The nominal year ending October 31st?

A. For the nominal year ending October 31st, 1905.

By Mr. **Page**:

1860 Q. Well, isn't it a fact that although the 34 degree Beaume oil cost more, that you have to use less oil to produce the same candle power with that as you would with 28 degree Beaume?

A. I cannot answer that question yes or no. In taking 34 degree gravity oil as for winter use it was certainly, as far as I was concerned, with the hope that we would use the minimum quantity of oil of that grade of oil during the winter months as compared with any other grade that we could obtain, considering its cost.

Q. That is, that it was the best and cheapest in the end?

A. I think so. And of the various grades of oil up to 34 I should expect we would use the minimum amount at 34 under the same circumstances as to temperature.

Q. You have added into your statement at page 1757 of the record the dividend of the National Coke & Coke Company?

A. Yes, sir.

Q. And you have not carried in, however, the value of $5,000 that was realized as surplus?

A. No, sir. I saw by the statement the other day that apparently the surplus was in the vicinity of $5,000. I don't know whether full provision was made for depreciation in that or not. If full depreciation has been considered, that $5,000 surplus, if credited to this account, would be equivalent to the $5,000 dividend, or an addition of .04 of a cent to this figure; that would increase the net return to 6.69 and .04 of one cent, making 6.73.

Q. Will you indicate from Exhibit 94 just what repairs you took into your statement to make the 12.31 which you used?

A. I could not indicate on this statement, because it does not appear in that statement. It appears on one of the exhibits. I don't know the number of this exhibit (indicating a paper). I took these figures here.

1861 Q. The exhibit you refer to is State's Exhibit L. Now, will you give us your method of arriving at your figure of 4.62, which is the result of the computation as stated on page 1757 of the record?

A. I took the five years from 1895 to 1899, repairs and renewals, which would appear on State's Exhibit L, as of 1895, 1896, 1897, 1898 and 1899, which amounts to 12.31 cents per thousand cubic feet, being the sum of all the expenses there shown, divided by the sales; so that, having that figure, we subtract from that figure the item which appears under 1905, similar item, 7.34, on the same exhibit, on page 2; that gave me the 4.97. Now, as for the five years the Consolidated Company was making and selling all its own gas, I thought it was fair to add to the repairs for 1905 that portion of the repairs to the generating apparatus of the other companies furnishing gas, amounting to .35 of a cent, and thus raising our apparent cost of repairs from 7.34 by .35, which would be 7.69.

By Mr. KIRBY:

Q. Where did you get that .35?
A. That I got from Mr. Carter.
Q. It does not appear in any exhibit?
A. I don't know whether it does or not. I do not recall. Before the Gas Commission that did appear. Last year it was .32 of one cent, I think.
Q. Where does that figure appear?
A. It is in the testimony somewhere before the Gas Commission, I don't know just where.

By Mr. PAGE:

Q. What is this item of repairs and renewals for 1905 which foots up $974,289.65?
A. 25 cents, isn't it?
Mr. MATHEWSON: Sixty-five cents.
The WITNESS: Is that for 1905?

1862 By Mr. PAGE:

Q. That is what I have here.
Mr. MATHEWSON: $974,289.65.
The WITNESS: I have 25 cents. It does not affect the computation at all.
Q. Is that made up of items that appear on Complainant's Exhibit 94?
A. Well, I have not checked them over, though I assume so.

Mr. MATHEWSON: That 2.12 for replacements would be in the 10 cents. That has been testified to before you came in, Mr. Kirby. This is not familiar to you, but all that is on the record.

Q. Then you did not check up to find out whether the amount that you were deducting corresponded with the amounts that were set forth in Exhibit 94, although you were going to make your deduction from Exhibit 94, did you?
A. I cannot recall that I did or not, Senator.
Q. What is this item of .78 cents for, labor?
A. That is the difference between our average labor during a period of five years and the present labor.
Q. Labor of the same five years that you have taken before?
A. No, that is of the prior immediate five years. Pardon me, not five, four years.
Q. You have given the valuation of the plant as a whole?
A. Yes, sir, I gave my judgment of it.
Q. How did you arrive at that?
A. By taking a valuation of the coal gas works at $400,000 per million feet daily capacity, assuming that the works were complete, and with a holder capacity equal to three-quarters of the daily capacity. That in the case of the water gas plant the price would be

$200,000 and the holder capacity equal to one-half of the
1863 daily capacity. All holders in excess of those amounts I assumed to be valued in excess of the amounts given by which I arrived at the valuation stated, and assuming likewise a value for the oil gas plant at 21st Street.

Q. Then as I understand it, the holders up to three-quarters daily capacity were included in this valuation of $16,800,000.

A. The holders up to three-quarters on the coal gas and the holders up to one-half on the water gas. For instance——

Q. (Interrupting.) Why did you assume the three-quarters on the coal gas, and the one-half on the water gas as the proper allowance to make in valuing the plant and the entire——

A. (Interrupting.) Because I thought that under the conditions existing here that if I were erecting a coal gas works I should certainly have three-quarters of the holder capacity at the station. If I were erecting a water gas works I should probably only have one-half of the holder capacity at the station.

Q. Isn't it usual among gas engineers to allow holder capacity equal to the daily capacity for 24 hours?

A. Yes, but the remainder of these holders I would have out in the district, not in the plant.

Q. Well, in this $16,800,000 that you have given as the value of all the Manhattan plants, together with 18th Street, did you figure any of the holders on Manhattan?

A. Yes.

Q. And you assumed, as I understand you, a unit value of $400,000 for a million cubic feet daily capacity.

A. Yes, being the same as $400 per thousand.

Q. And $200 a thousand for water gas?

A. Yes, with the proportion of holders, as I have stated.

Q. I understand that is what you have estimated it would cost to replace the plant new, or is that the valuation of the plant as it stands today?

A. Well, in figuring I was thinking of the value of the
1864 plant on Manhattan Island as a going concern, replacing it as it is.

Q. Would that be replacing it with a modern and up-to-date plant?

A. My idea was replacing it as it was.

Q. On the same theory that Mr. Mayer gave in his testimony?

A. I do not recall the full theory of Mr. Mayer, but my idea was the plants as they stand in operation to-day that they were worth that much.

Q. You have not made an inventory of the plant, as did Mr. Mayer?

A. No, it was beyond my power to do so.

Q. The company has no inventory itself?

A. Yes, they have now a complete inventory as a result of this examination of Mr. Mayer's. Prior to that they did not have any.

Q. It has nothing to do with the book value of the plant, that statement here?

A. No, sir.

Q. Now, last July I asked you to get me up a statement of the

Astoria plant, showing in detail the cost of buildings and apparatus. Have you such a computation?

A. No, sir, I have not, Senator; I attempted to arrive at some figures for your benefit.

Q. I am glad it was for my benefit, but if the figures had been gotten out in the way that I wanted them, it would be more to my satisfaction.

A. I understood that Mr. Mathewson was in touch with you in regard to that, and that he showed you certain figures and that you made a memoranda of what you wanted, and I understand that a statement is being prepared, better than I could personally do it.

Mr. Mathewson: I did prepare one for the Senator, which I thought was what he wanted—or, rather, I had it prepared—and he wanted it put in better shape, and it was sent back to be put in 1865 better shape; in the meantime Mr. Bradley's foot was run over, and that has put us back, but they are at it now, or were on Friday, trying to separate it in the manner that the senator has suggested.

The Witness: I have taken that same statement and endeavored to separate certain items myself.

Q. You have not a copy of that?

A. No, I did it myself in spare hours that I had over there.

Mr. Page: Well, we will have to get at it the best we can, I suppose.

Mr. Mathewson: You suggested that I have that before Mr. Bradley was put on, and I told you I would have it unless something broke. I did not know that you wanted it with Mr. Addicks.

Mr. Page: I wanted it with any one who was going to testify as to Astoria property.

Q. How much did you state was the total investment at Astoria, on your direct-examination? Do you remember?

A. I have stated that the estimated cost for the first 20,000,000 units, not including certain additional items, was $13,134,519.65.

Q. Of that amount how much was expended for the purchase of the real estate?

A. The land valuation, $1,132,558.28. There is an item, however, of bond interest; I do not know whether that is included in that or not.

Q. Is that the cost of the land or the estimated value which was placed upon it?

A. No, that is the book value as it stands on our books.

Q. Well, by book value do you mean what it actually cost you?

A. In the statement here it says "Actual expenditures for land."

Q. How much did you expend on that land for grading and filling?

A. That work is not yet completed; I cannot tell what it will be.

1866 Q. What figure did you estimate for grading and filling to make up the total of $13,134,519.65 for the entire plant?

A. $317,000, in round figures. Grading, filling and certain excavations, $317,543.

Q. How much for docks?

A. Wharves, $190,000.

Q. Is that even, $190,000?

A. Yes, sir.

Q. How much for the tunnel?

A. $2,650,000.

Q. 15,000,000 feet holder capacity would be sufficient capacity for a 20,000,000 works, would it not?

A. When supplemented by one-fourth more in the city, coal gas at the works; but at the station there should be two holders. With that qualification, yes.

Q. You have just been giving your estimate of the valuation of the plants in Manhattan, estimated coal gas plant, with three-fourths capacity at station?

A. At station. I say three-fourths under the conditions in New York. Three-fourths would be sufficient, aside from the question that there should be two holders; in other words, that 15,000,000 for one plant should be divided into two holders.

Q. Well, but the capacity of the holder would be sufficient if it is going to be divided into two holders?

A. On the basis of capacity, yes, sir.

Q. How much have you added in this $13,134,519 for a second holder?

A. For the second holder, about $230,000.

By Mr. MATHEWSON:

Q. That is for the plant, is it not?

A. Yes, sir.

By Mr. PAGE:

Q. I have here second tank and holder, $700,000.

Mr. MATHEWSON: No, that is the holder itself.

Mr. PAGE: But it costs more, the tank, than a holder.

A. Yes, but there should be something in addition to that.

1867 Q. The holder is at $200,000 odd, and the tank is $700,000 odd.

A. $279,000 instead of $230,000.

Q. What would that be for?

A. That would be for a holder tank, including the cement required for construction. That is only the tank, not the holder.

Q. What was the $700,000 which you testified about, in regard to the second holder?

A. That is for the gas holder proper, including stanchions and crowns, girders, etc.

Q. You have figures for a coal storage bridge, $150,000 each, rope haulage and coke storage?

A. That is right.

Q. And in that was an item for $700,000 for a second holder?

A. That is only the steel work, sir.

Q. That enters into this statement that you have given for $13,134,519?

A. Not that one; that is the second one; but the first one would enter into it.

Q. Then I understand that none of this $2,282,500 which you testified to on direct examination is included in this $13,134,519, such as houses for employés; is that right?

A. I think that is true with this exception; I was a little doubtful whether that $150,000 was for the second bridge, which in my judgment we should have. There is one $150,000 in the original estimate for a bridge, and this $150,000 is for a second bridge, which would not be necessary for the plant except in so far as duplicating a bridge for handling coal, and some way to provide for accidents. For everything from scows and tugs down is not included in any part of the $13,134,519.

By Mr. Mathewson:

Q. No part of that $2,282,500 is included in the $13,134,519, is it?

A. I think that some of those foundations—while they were in the original, like this $80,000 for foundation appropriation—that was more than used up in the original estimate, and therefore it 1868 would have to be added here in order to complete this other work. In other words, while the original estimate may have considered that those certain foundations may have been done for certain figures, those estimates were more than used up, — required a further appropriation of $80,000 to complete the work, and therefore it is included.

Q. I want any part of the items that you have testified to as making up the $2,282,500 included in this figure of $13,134,519.

A. I do not know of any item as to dollars and cents that is so included in the $13,134,519; only simply as a matter of description.

Q. There is only then the second holder and the tank for the holder, of capacity of 15,000,000 cubic feet, that are in the figure of $13,134,519?

A. No, I have already told you that there is one holder, but two tanks.

Q. That other tank then is how much?

A. The two tanks together are twice the figure that I gave before.

Q. You did not give me the first?

A. I gave you a figure of $279,000 as applied to one; for the two, $558,000. You understand that in building one tank it is necessary to build two. In constructing one holder it is necessary to have a second tank if you expect at all to extend your plant, only having one holder.

Q. Why?

A. If you are going to have a second holder, you have to have a tank for it. We cannot dig a hole for a second tank if we have a holder there inflated and with water in the tank. We would have to draw all the water out of the first tank if we did not build a second tank the same as the first. Do I make myself clear?

Q. You make yourself clear as a statement of fact, but I cannot understand any reason for it.

A. Suppose we had a tank and the holder in it. Here is the first unit; (draws diagram illustrating); now, we want to put 1869 alongside of that a second one; we cannot put that tank in unless we let all of the gas out of that holder and let out all of the water.

Q. Why not?

A. Because the head of water in this wall here; this goes down about fifty feet and the hydrostatic head of water on that part would burst the whole tank right out.

Q. Then the second tank was built because of this condition, but it was not because it was necessary to take care of the product of your first unit?

A. I think it is. I think if you have only one holder you should have two. As I said today, the other $279,000 is for the second holder.

Q. You might have two.

A. Yes, that is true, if we were not going to build more than that, but in the plant at Astoria it would have been very foolish not to do so.

Q. Now, what other matters have you the value of in detail outside of the plant itself? By plant I mean pump manufacturing apparatus and buildings.

A. I have no items except what would be included within the plant itself, unless it be the item of a 60-inch main.

Q. Well, what have you got the 60-inch main at?

A. $620,000, including the pumping station.

Q. How much is the pay for the 15,000,000 foot holder? I believe that is finished?

A. No, the holder is just under way. It will not be finished until next year.

Q. Mr. Bradley stated that he was hoping to begin delivering gas from that station by the first of October.

A. He does hope to, into a main without the holder.

Q. Then, where will you deliver the gas, into the mains of the company in New York or into the holders?

A. It will go by the way of Ravenswood; it will go into one of the holders there with water gas, mixed with water gas there.

1870 Q. Has the company sufficient holder capacity to take charge of its present product, and the additional which will be manufactured at Astoria?

A. I don't recall exactly the holder capacity at the present, but it should be the daily capacity of the works. I think not.

Q. That refers to the entire holder capacity of the company, doesn't it, the rule that there should be a day's holder capacity?

A. Certainly. I think they would be short about 10,000,000 feet, that is my memory of it.

Q. We have got so far items amounting to $5,189,101.28. Will you give me in as much detail as you have it the items for the remaining $7,000,000.

A. Senator, I cannot agree with those figures unless I know what they are. If you now have so many millions——

Mr. **Mathewson**: Why not let him give a statement making up the $13,134,519.

Mr. **Page**: Very well, he may do that.

The **Witness**: Shall I give them consecutively from start to finish?

Mr. **Mathewson**: The Senator says that will satisfy him.

1871 The **Witness**:

Grading and filling and excavating, including Winthrop Avenue	$317,543.53
Dredging	160,000.00
Wharves	190,000.00
Coal and coke handling plant	700,000.00
Inclined retort house	1,400,471.92
Horizontal retort house	1,191,232.29
Purifying houses and contents	608,745.00
Boiler plant	49,717.31
Exhauster house and contents	47,730.06
Condensing plant	599,981.81
Land drainage	50,000.00
General Gas Connections	40,000.00
Tar and ammonia separation and storage	40,000.00
Water supply	20,000.00
Meter house and contents	65,560.44
Holder	640,800.00
Holder tanks	460,000.00
Tunnel under Ward's Island, exclusive of lining	2,050,000.00
Electric power plant	160,000.00
Gas pumping plant at Astoria	90,000.00
Office	50,000.00
Shops	40,000.00
Foundry, not included, first units, in this item here.	
Soundings and borings	200,000.00
Fences and temporary structures including salt water plant	50,000.00
Bi-product plant not included in these figures.	
Total	$9,321,782.36
1872 Brought Forward	$9,321,783.06
Undistributed expense 10 per cent	932,178.31
Total	$10,253,961.37
The 60-inch main with gas pumping plant	$620,000.00
Total	$10,873,961.37

Real estate	1,132,558.28
Lining of tunnel	600,000.00
Coal shed	400,000.00
Cement for two gas holder tanks	98,000.00
Overhead gas mains and apparatus between retort house and exhauster house	30,000.00
Estimated cost of first 20,000,000 cubic foot unit	13,134,519.65

Q. What do you mean by undistributed expense 10 per cent.?

A. Those are expenses that are in addition to all that the engineers can foresee in the construction of the works. In this plant up to date I think on the figures I made it has been between nine and ten per cent. over and above those figures I have given you. It covered the extra cost of building beyond the estimate and all other contingencies.

By Mr. MATHEWSON:

Q. Does it cover the company's engineering expense in laying it out?

A. Yes, sir, it covers certain expenses in connection with that beyond what may be figured as part of the expense on the estimate.

1873 By Mr. PAGE:

Q. Your engineering force, or the engineering force of the Consolidated Gas Company, is the one that laid out this work, isn't it?

A. There are certain engineers that we have that are on the Astoria payroll, and such expense connected with them is charged to them.

Mr. PAGE: I will let Mr. Kirby examine Mr. Addicks. He has been trying to explain a certain line of examination to me, and if there is no objection he may continue.

By Mr. KIRBY:

Q. It is the custom of electric light companies, Mr. Addicks, to plot the daily output of current on a curve, showing the number of kilowatts drawn off. Is that the custom of gas companies, to show the amount of gas either drawn from the holders or placed in the holders? Have you any records of that kind?

A. I don't know that we have. Some companies do or have plotted off for certain purposes a daily make or send out; others do it by the week. It may vary in various companies.

Q. Does the Consolidated Gas Company do that, either by the day or by the week?

A. I really don't know whether they do or not. I don't remember seeing such a curve. I have seen one by the year or something of that kind but I don't remember seeing one of a shorter period.

Q. You have records showing the output per day, have you not?

A. Not of the Consolidated Gas Company. We don't know what our output is from day to day.

Q. Do you know it from week to week?

A. No, we do not know it from week to week.

Q. Or from month to month?

A. Month to month we do knew.

1874 Q. Do you have that for the different stations, or for the company as a whole?

A. The company as a whole. We also have the output of the various stations from day to day.

Q. Would not that show the days in the year upon which the largest amount of gas was drawn from the holders by the consumers?

A. Not in the case of purchasing gas, we would not determine that.

Q. Outside of the subsidiary companies from which you purchase gas, do not your own stations keep a record of the daily output of gas?

A. Of their own make?

Q. Of their own manufacture.

A. Yes. That I gave the other day in my testimony.

Q. And you were to furnish to Mr. Burr, I think, a statement showing when the maximum output was had or whether the period came within the month of January or December?

A. No, I think Mr. Burr wanted me to furnish if I could, the outputs of the 23rd and 24th of December, 1905, and I first said I would endeavor to do so, and then I called his attention to this condition of affairs that would prevent my giving the maximum output of the Consolidated Gas Company on any particular day.

By Mr. MATHEWSON:

Q. You mean the maximum sales, not the manufacture of the several Consolidated Gas Company's stations?

A. Not the manufacture, no. I can readily give the maximum amount of gas manufactured by each station of the Consolidated Gas Company, and those added together would give the maximum amount of gas made by the Consolidated Gas Company's own stations; but that is not the question. It is the sales of gas that I think Mr. Kirby is asking for, and I think that Mr. Burr wanted, and that I could not do.

1875 By Mr. KIRBY:

Q. You have a meter at each station showing the amount drawn from each station, haven't you?

A. No, the meter at each station shows the amount manufactured at each station, but the amount going out of the holder is not measured.

Q. That is only measured——

A. The algebraic difference between the meters and holders.

Q. And is that calculated for each day in the year?

A. Certainly, it shows the output so far as that station is concerned, irrespective of what is purchased, and what is purchased you know, may be put into the holder or into the mains adjacent to the holders, therefore we have no account of that.

Q. So that your records would show the maximum day of each station reckoned in the way you stated?

A. The maximum make, yes.

Q. No, you have stated that your meters show the make and your holders show the capacity at the station?

A. It shows the amount on hand at the station.

Q. And the difference between the amount which goes in and the amount in the holder to-day as it was yesterday would give you a basis of calculation to show how much was drawn out yesterday?

A. I know, but some of that gas might have come from some other source.

Q. You have a record of that, haven't you?

A. No, some may go into the mains immediately adjacent to that works. It would simply show the amount which has gone through those holders, but there might have been some gas gone through the main which while it came through the works and went out, it would not be indicated by the holder, because the holder might not have changed.

1876 Q. Do you mean to say that it is impossible for you to say how much gas has been drawn from the holders each day of your various stations?

A. I don't think it is possible to say that definitely. Suppose you poured gas into the holder at the rate of 100,000 feet and the consumption might be 100,000 feet, you might be pumping 100,000 and 100,000 feet going out, and the holder would remain stationary.

Q. Quite so, and you would know your use was 100,000 feet?

A. No, we have no way of measuring it.

Q. Your holder remains stationary?

A. Yes, but we have no way *to* measuring it.

Q. So you have not used any more than you have produced?

A. We would have no way of measuring the 100,000 feet in the holder. I am assuming it was 100,000 feet, but we would have no way of measuring it except returns by the exhauster, and the exhauster not being an accurate way of measuring gas, it would not be taken as a definite measurement.

Q. Is it not a fact that the deduction of the gas that has passed through the station meter into the holder, being of a certain definite amount and the holder not varying one way or the other, it indicates that the amount of gas, drawn from the holder is exactly the amount which went into the holder?

A. That is an exactly correct statement so far as that station is concerned, irrespective of the amount of gas obtained from some other source which may have gone into the holder or out of the holder.

Q. How do you measure that which comes from some other source and goes into the holder?

A. It is not measured.

Q. How do you reckon the amount to pay for it?

A. By computation at the end of the month, taking into consideration the amount made at the station every day which came into the

1877 holder, and the amount of gas used by the consumers of the company with an amount estimated for the unaccounted for gas, and the difference is the amount sent to us during the month. Of course, it would be practically impossible to have meters large enough all over the city to measure that. It would take a very large expenditure of money to have meters to measure that.

Q. Then there is no way except by guess work that your various manufacturing plants know the amount of gas that they may be called upon to manufacture during the coming day, be that in December, or be that in July?

A. That is so of every gas company in the world. We never know what we are going to make from day to day.

Q. If it were an independent gas company drawing its gas from no other source than its manufacturing plant, then it would have an exact measurement of the gas going from its holders each day or each period of measurement, would it not?

A. Yes.

Q. So that company, contrary to what you say being merely a matter of guess work, would have exact figures upon which to base its expected gas to be manufactured?

A. I did not say it was guess work as far as the meter was concerned. I said it was guess work what we were going to have from day to day, but we do have in each works exactly how many feet of gas is made. That is a definite quantity measured by each meter in each individual works.

Q. How do you know how much to make each day?

A. From a general knowledge of the situation.

Q. But by no definite measurement?

A. Nobody can tell. It depends how much we have in our holders. If our holders are empty we have to fill them.

1878 Q. But you know in December that you use more gas than in July?

A. In a general way we know we will use so much apparatus, but it may be more or less. It is a very uncertain quantity from day to day. It all depends on how much holder capacity you have, whether you have to start up apparatus or gain or lose on your holders from week to week.

Q. I think you have made some figures, have you not, on the yearly consumption per consumer?

A. Yes, I had some figures.

Mr. Kirby: Have they been put in evidence?

Mr. Mathewson: Yes.

Q. How did you reckon your number of consumers?

Mr. Mathewson: Mr. Carter prepared that statement. I don't know that Mr. Addicks knows.

A. Well, I have not refreshed my mind for this hearing, but based on the number of meters as I have it——

Q. And what meters were figured into that calculation—all the meters of the gas company installed at various parts of the city?

A. Active meters.

Q. What do you mean by active meters?

A. Those actually in use and recording, not those in the shop or out of use.

Q. No matter what the amount of gas might be which passes through those meters, or whether they were in constant use or not?

A. Well, those that were in the shop for repairs would not be in use at all.

Q. In other words, let us assume a store which formerly was lighted by gas and for some reason changed from gas to electricity, still keeping its gas pipes there, so that in case of necessity
1879 or breakdown of the electric light system, it could use gas; a meter would be there for the purpose of measuring that gas. You have considered those meters in your calculation, haven't you?

A. I think not.

Q. Well, do you know just what meters you have considered in your calculation.

Mr. **Mathewson**: He did not make the calculation.

A. I could not answer that.

Q. You simply took figures given you by Mr. Carter?

A. As to the active m-ters in use, yes.

Q. Would Mr. Carter know?

A. Mr. Carter would undoubtedly know exactly.

Q. On Thursday or Friday last, you gave your opinion in reference to the increased use of gas with the decrease of price per unit. Are you familiar with conditions in this city as they existed in 1899, when I think the so-called gas war was on?

A. I knew there was such a gas war.

Q. Do you know whether or not the consumers increased during that period or not?

A. I have a record here of the number of active meters, which would indicate that.

Q. Which would indicate an increase?

A. Yes, 1898 and 1899. Exactly what was the year of the gas war, do you recall it?

Mr. **Mathewson**: 1899 and 1900.

The **Witness**: Well, there was an increase in——

Mr. **Mathewson**: That is already in evidence in a complete statement which Mr. Carter testified to, showing the active meters each year from 1885 down to date, and the consumption per meter.

1880 Q. That is a fact, that there was an increase in that year as shown by the record?

A. The record I have before me between 1897 and 1898, shows there was an increase of about 30,000 meters; in 1898 and 1899 there was an increase of nearly 36,000 meters; and the following year, 1900, there was an increase of 22,500 meters.

By Mr. **Burr**:

Q. These are not any part of them prepayment meters, are they?

A. They are everything.

By Mr. Page:

Q. Was the prepayment meter in existence in 1898 and 1899?

A. I am merely saying that it included everything. I think they were in existence then, I don't recall the first year we put them in use.

Mr. Mathewson: I don't think we had many of them, if any.

Mr. Page: No, I think not.

The Witness: There is a record of that.

By Mr. Kirby:

Q. If they were in use, they were in the great minority?

A. I should think so. They have increased very materially in the last few years, but I am sure they were in use before 1898.

Q. You have testified that the chief engineer of the company, Mr. Bradley, stated to you that in his opinion, to produce 22 candle power gas during the winter it would be necessary to use a lighter oil than was then being used by the company?

A. That is right.

Q. You were of that same opinion?

A. Yes, absolutely.

1881 Q. Would it not have been possible to have produced 22 candle power gas by the use of a larger amount of 28 degree oil rather than to use 34 degree?

A. I don't know whether it would or not, but if so, I do not think it would be used economically, and it would be to the disadvantage of the distributing system.

Q. In other words, it would have been cheaper to produce 22 candle power gas with 34 degree oil than it would with 28 degree?

A. That was our effort.

Q. And during this period of use of 34 degree oil the Consolidated Gas Company bought this oil not only for its own manufacturing plant but for that of the other companies from which it purchased its gas?

A. That had been the custom and I followed the same custom. It does not include the Mutual, however.

Q. Was it an old custom?

A. It was the old contract and I simply followed it.

Q. Do you know how many years it went back?

A. I do not.

Q. Do you know whether it went back as far as 1904?

A. Well, it was that previous contract.

Q. Before 1904?

A. I cannot say, it was that previous contract.

By Mr. Page:

Q. By previous contract do you mean City's Exhibit 10?

A. I don't recollect. It was the one I had at the last hearing.

Mr. Mathewson: Yes.

By Mr. KIRBY:

Q. Has or had any effort been made by either the Consolidated Gas Company in its own manufacturing plants or by the subsidiary companies to produce 22 candle power gas with 28 degree oil?

1882 A. We had been using 22 candle power with 28 degree oil.

Q. I mean during the winter months?

A. This was brought around by the difficulties about the candle power.

Q. What were those difficulties?

A. I don't recollect, I simply took the reports that came in.

Q. We would have to refer to Mr. Bradley?

A. Yes.

Q. You as an expert in these matters must know what these difficulties are?

A. I anticipated what they would have been with 28 degree oil.

Q. What were they?

A. That we would not have been able to maintain the candle power.

Q. Why?

A. Because the grade of the oil is a very heavy grade oil, and during the severe weather it is not as stable as to its illuminants as the lighter grade oil.

Q. Have you ever had any personal experience in the endeavor to use 28 degree oil for 22 candle power gas?

A. I think the first experience I ever had in using as low grade as 28 degree was here.

Q. Do you know whether or not any of the subsidiary companies of the Consolidated Gas Company have used oil of as high a specific gravity as that, to produce 22 candle power gas?

A. They are using 34 gravity. I know they used 28 in Boston and had to drop it there for the same reason. They could not make their candle power with 28 degree oil.

Q. It has been made, hasn't it?

A. We make it during the summer.

Q. It has been made during the cold weather with 28 degree oil?

A. I presume you can at certain times. The moment we changed this summer from 34 to 28, we had a little cold snap and lost our candle power.

Q. But the main reason was you thought it would be more

1883 economical?

A. Certainly, so we could make our candle power that we had to, in order to obey the law.

Q. In making your calculations as to whether or not it would be more economical, did you take into consideration the fact that you had an existing contract for a certain price for that oil, and had to make another one of probably a higher price, and when you found it would be a higher price, did you reckon the difference in the calculation?

A. No, we have to maintain the law and obey the law in the first place, and I took in- consideration all the elements under which we were compelled to work. We must obey the law. We have a fine of $1,000 for every station——

Q. Couldn't you obey the law with 28 degree oil?

A. We didn't think we could, no, sir.

Q. In endeavoring to purchase this 34 degree oil, I take it you made inquiry from no other company than the Standard.

A. No, I should think it would be an absurd proposition.

The **Master**: Mr. Kirby, that question has been asked at least twice before, to my recollection. That whole question of Standard oil and contracts has been thrashed out by Mr. Burr, and also gone into by Senator Page.

Q. Could not you have purchased 28 degree oil at a very greatly decreased price, and would it not have answered your purposes, if you could have?

A. It would not have, no sir. 34 gravity oil is the oil we know we could handle.

Q. Have you ever made any experiment with 32 gravity oil?

A. We have had 32, 34 and 28, but I knew as a matter of fact, the lower you go in gravity the less stable the oil is. If we could have naphtha at 62 degrees, we would have more stable gas still.

1884 Q. And we would have a very expensive one also.

A. Yes, exactly. And there is a happy medium which you have to reach.

By Mr. **Page**:

Q. How do you lose the candle power of gas? You say you lose it in cold weather?

A. How? I don't know how the candle power is lost, except it is lost.

Q. Are not the illuminants absorbed by the water in the tank, they being cold?

A. I don't know all the reasons for loss of candle power.

Q. Don't you get it back again in warm weather?

A. No, I think not, you may have hydro-carbons on your tank, on the water in the tank, which are precipitations in winter, which may or may not vaporize during the summer, or it may require heat to vaporize them. As a rule we do find hydro-carbons on top of the holder which is pumped out from time to time so as not to have it in too great quantities on the surface of the water. We also find it in our meters at certain times, and in our mains. We do lose candle power, but how or why we do lose candle power, I am not prepared to say, except that the illuminants do not stay in the gas.

Mr. **Page**: We have no more questions to ask.

By Mr. **Burr**:

Q. I understood you to say, Mr. Addicks, that you were not able to give me the information which I asked for at the last hearing regarding the maximum amount of sales around the Christmas holidays, December 23rd and 24th.

A. Yes, sir, of the Consolidated Gas Company, for the reasons I gave the other day and also reiterated to-day.

1885 Q. Let me ask you, is it not a fact that the maximum amount of sales on any given day amount to 70,000,000 cubic feet?.

A. For the Consolidated Gas Company?

Q. Yes.

A. I estimated at one time it would be somewhere around that. but it is a pure estimate. That was my estimate. I think at one time it was about 70,000,000 cubic feet for the Consolidated Gas Company alone, but I don't know whether that is exactly right or not, I could not say.

Q. That would be your estimate now?

A. I have no reason to change that estimate.

By Mr. MATHEWSON:

Q. Do you mean a maximum day's sales?

A. On any one day's sales.

Q. I didn't know whether you meant an average sale?

A. No, not at all. I mean a maximum day's sale. I cannot substantiate that any better than I have.

By Mr. BURR:

Q. It is somewhere between 65,000,000 and 70,000,000 certainly?

A. I should think so, that is my judgment of it.

Q. And you have stated heretofore, as you state now, that you estimate it at 70,000,000?

A. I have estimated it myself at 70,000,000 and showed figures for it. I cannot say how accurate the figure is.

Q. Are renewals or replacements due to the wearing out of machinery, mains or other wearing out of plant, or due to the necessity or other and larger machinery?

A. I think they would be due to both things. In a great many pieces of apparatus in the plant, on account of replacement due to requiring larger apparatus or machinery.

1886 Q. Have those items, once renewed or replaced by the Consolidated Gas Company, ever been renewed or replaced a second or a third time?

A. I don't know.

Q. Mr. Bradley would know more about that than you, I suppose?

A. Yes.

Mr. BURR: That is all I want to ask Mr. Addicks. While I have the floor, I want to inquire if it would be agreeable to counsel for the company to furnish me with an analysis of the real estate account or allow Mr. Hayward to make such an analysis from the books of the company themselves.

Mr. MATHEWSON: I don't quite understand what you mean by an analysis of the account.

Mr. BURR: I want an analysis of the real estate account on the books of the company from 1884 to date, including all the purchases and sales.

The **Master**: That cannot be for the purpose of cross-examination, can it?

Mr. **Burr**: No.

Mr. **Mathewson**: And besides Mr. Francklyn testified to the real estate which has been bought or sold since 1884, and it was almost negligible.

Mr. **Burr**: There were very few transactions, but they were not given so as you would allow Mr. Hayward to make that analysis — would simplify matters, or Mr. Carter can prepare it himself.

Mr. **Mathewson**: Doubtless Mr. Carter can have it prepared. It is for the purpose of your case I presume?

Mr. **Burr**: It will save bringing the books. I am saying that now so that you can have it prepared.

1887 Redirect examination by Mr. **Mathewson**:

Q. You were asked whether you had made any endeavor to secure oil from any other company than the Standard Oil Company. Do you know of any other producer that produces oil enough to provide for the Consolidated's requirements for Manhattan Island, except the Standard Oil Company?

A. No, sir. I have every reason to believe that the entire production in the United States of the quality of oil we require, outside of the Standard Oil Company, would not supply our requirements.

Q. Even if it could all be gotten together in New York?

A. Even if it could all be gotten together in New York.

Q. Assuming you had to employ coke instead of anthracite coal for water gas by reason of a strike or otherwise. How would that affect your working capacity?

A. It would reduce the water gas generators by approximately 20 per cent.

Q. How do you figure the maximum working capacity of a generating plant for a year with the maximum capacity for a day?

A. I always estimate that about two hundred times the daily capacity would be the safe working annual capacity.

Q. That takes into account the period required for repairs and also the smaller amount of consumption in the summer?

A. Yes, sir.

Q. When you said before the Gas Commission that the policy of the company was to replace in Astoria its generating plants in Manhattan, had any act then been passed or any order made reducing the charge for gas in New York City to private consumers to 80 cents?

A. No, sir.

Q. Or to anything below a dollar?

A. No, sir.

Q. You said that the company could produce gas at Astoria for the purpose of supplying the Borough of Queens. Were you
1888 referring to the physical capacity of the plant or to the franchise?

A. To the physical capacity of the plant. The mere fact of their presence in Queens, that we could supply Queens.

Q. If you had a franchise?

A. Yes, if we were enabled to supply it.

Q. It has been testified to that the ten cents per thousand charged to cover replacements and contingencies was first written into the books in May, 1905, following the report of the Stevens Committee. Was that the first time it was discussed?

A. No, sir. I had discussed it in the previous year.

Q. You have testified that you testified in Boston. How early did you testify in Boston?

A. I think my testimony was taken about the first of the year 1905.

Q. Did you testify at that time that ten cents per thousand should be allowed for contingencies?

A. I testified I thought there should be such an allowance.

Q. Had the Stevens Committee at that time been a*a*ppointed?

A. I don't know that the Stevens Committee had been appointed. I don't remember the exact date of my testimony and the date on which the Stevens Committee was appointed, but I will say perfectly frankly that the question of this allowance of ten cents, so far as I was concerned, arose long prior to any sort of any investigation of the company.

Mr. Mathewson: There is no doubt is there, that the Stevens Committee was appointed in March, 1905?

Mr. Page: No.

Q. In reference to the expenditure for street lamps, you were asked why it was not deducted in operating expenses? Do you
know whether that item goes into operating expenses under
1889 the custom of the Massachusetts Gas Commission?

A. Yes, sir.

Q. Or the New York State Gas Commission?

A. There is such an item in operating expenses in both the Commissions' printed reports.

Q. And on this side when you give your statement of income for the year 1905, Exhibit 96, does that include all the receipts from street lamps on the other side of the account?

A. Yes, sir, our receipts from street lamps and other receipts.

Q. You stated that you knew and you read what Boston was paying for oil. Do you know whether that was more or less than New York was then paying?

A. At the time I knew it was about the same, somewhere in the vicinity of 4½ cents a gallon.

Q. That was in 1905, wasn't it, the nominal year, when New York was paying a little over four cents?

A. Yes, sir, paying 4.04 at the same time.

Q. You were asked by Mr. Burr if you could explain the difference in cost between the different months by companies whose gas was delivered to the Consolidated under the agency agreements. Will you look at the Gas Commission Exhibit 105, which is City's Exhibit 36? It appears by this exhibit that the Central Union Gas Company was delivering gas to the Consolidated before July 1st, 1905, at about 26 to 29 cents per thousand, whereas after July 1st it was 32 and even 34 cents per thousand. Will you explain that difference?

A. On account of the increase in candle power and the fact that there had been no examination of the Central Union Company's gas by the city's officials and they had no outside photometer whatever. They discovered that their amount of oil used had to be increased in order to maintain their candle power at 22, and that of course increased the cost of gas.

Q. Prior to the taking effect of the Act establishing the 80 cent gas, which was July 1st, 1905, was there any inspection for
1890 candle power in the Borough of the Bronx, in which the Central Union was operating?

A. I do not think there was any whatever.

Q. Do you remember the testimony that the inspection was confined to the Island of Manhattan by the officials of the city?

A. Yes, sir. I don't think there was any inspection in the other Boroughs as well, but Manhattan has always been inspected regularly.

Q. Were the services ever referred to in the gas business in your experience as mains?

A. Not in my experience, sir.

The Master: He said that on his cross-examination, did he not?

Mr. Mathewson: No, he was not asked so far as that. Senator Page stopped just short of that.

Q. Would there be any special difference between pressure in the main just outside the service and in the service at the entrance to the main?

A. Not material, normally.

Q. Assuming that you eliminate the effects of the law of gravitation on the distribution of gas, would it be possible in your judgment in that case to comply with the law establishing a pressure of between 2½ inches and one inch and still supply your consumers with gas?

A. Not in my judgment.

Q. You have been asked in reference to district governors? Under what system of pressure are district governors used?

A. As far as this country is concerned—I cannot say as to others—ordinarily by a high pressure line distributing gas into a lower pressure line, there being quite a large difference in pressure between the high pressure line and the low pressure line.

1891 Q. Is there any special danger in the use of the high pressure mains?

A. I think there is a very grave danger; the danger of fracture to the main under the crowded city conditions. The amount of gas escaping from a main under those circumstances would be so great as to be very difficult to handle, the accumulation of gas in the street would be very rapid, much more rapid than the ability of any emergency force to cope with, in all probability, and in addition to that the main itself is difficult to handle with our present methods of controlling by bagging. You have to have valves in all directions in order to handle it. In suburban districts these reasons do not apply to the same extent because the territory is sparsely settled, and there is usually a considerable distance between the mains and the houses, and there are no subways or places for gas to accumulate in. Personally I am very much opposed to high pressure service in a crowded city.

Q. Well, in case your governors gave out or got out of order, what would be the effect as to the high pressure mains?

A. Any failure on the part of a governor would involve a very populous district and might involve serious accidents to the public.

Q. Mr. Bradley or Mr. Simpson has testified that in many streets of New York City it was impossible to lay down any additional mains of any sort, but assuming it would be possible and proper to instal a system of high pressure mains throughout the City of New York, would that be a matter of considerable time and large expense, or otherwise?

A. It would be a matter of a very large expense and very considerable time, and when we had finished we would not know what condition we were in as far as distribution was concerned on account of the lapse of time in starting and completing the work.

Q. In other words, the character of distribution to different sections, according to your experience, is changing?

1892 A. According to my information. I have more information in New York than I have experience. I have experience elsewhere.

Q. Would the expense of such a system amount to hundreds of thousands of dollars or millions or what, generally speaking?

A. I should not like to state any figure, but I would not set it at less than millions of dollars.

Q. Now, let me ask, assuming you establish a system of high pressure mains, with the conditions in New York City, would it, in your judgment, then be possible to distribute gas so that never at any time in any distributing main at any time would there be a pressure outside of two and one-half inches on one side and one inch on the other?

A. I should not undertake to carry out any such proposition, Mr. Mathewson.

Q. I ask whether in your judgment it could be done?

A. I do not believe I could accomplish it. That is my frank opinion.

Q. Do you know of any city or place in the world where there is any such provision as that?

A. I have not been able to ascertain any city that had any such provision or approximated it.

Q. You know some cities which have minimum requirements, that there shall not be less than one inch pressure?

A. I do, and in some cases less than that—.6 of an inch.

Q. Do you know of any city which provides a maximum pressure?

A. I never heard of one.

Q. When you testified as to the estimate for additional enrichment, before the Gas Commission, you were dealing with the nominal year ending October 31st, were you not?

A. I was.

Q. And that contained how many months of the 22 candle power?

A. I think four months.

1893 Q. And your present testimony is in relation to the calendar year containing six months?

A. Six months.

Q. Senator Page has asked you whether the plant at Astoria will not be new. Is it not your experience that a new plant frequently requires repairs?

A. Parts of this plant are being repaired now.

Q. Is it not a fact that from the moment a plant starts up in operation that it requires repairs, whether new or old?

A. Yes.

Q. And isn't it sometimes true that before a plant gets to operating smoothly, that repairs and changes are required that you do not have in one which had been operating some time?

A. More changes than repairs. Sometimes the retorts after they have been repaired, they probably are better than when they were originally put in; they are apt to be so. A second set of retorts on an inclined bench would probably be better than the first set because all the remainder of the setting had gotten its bearings and only the retorts would be affected by the next heating.

Q. Your attention has been drawn to the fact by Exhibit 93 that the station cost of gas to the Consolidated for the nominal year ending October 31st, was 33.7, while for the calendar year the station cost was 33.17. Which figure did you take as the basis of your computation presented here, showing the cost of gas to be 69.36 cents?

A. I took the cost of gas as by Exhibit 94.

Q. That is the lower cost?

A. It is a lower cost in the station cost, yes, sir.

Q. For gas manufactured by itself?

A. In the stations cost, yes, sir.

Q. You use the term "undistributed expense" in speaking of the ten per cent., which you added to get the complete value of the plant. Is that an engineering term or is it one which you used?

1894 A. Well, sometimes used that way, or sometimes put in as "uncharged labor and material." It practically means the same thing.

Mr. MATHEWSON: I have nothing further.

By Mr. BURR:

Q. Is it your opinion, Mr. Addicks, that the pressure should not be regulated at all by law?

A. I don't see any necessity, Mr. Burr, for regulating the pressure of a gas company, absolutely none, and for this reason no gas company wants to carry too low a pressure because they do not want to run the danger of the gas going out. That would be a serious danger and therefore it is useless to place too low a pressure limit on it.

As far as a high pressure is concerned, no gas company desires to give any higher pressure than is necessary to reach the necessities of the apparatus used by the consumers. They have got to overcome a great many difficulties. In the first place you have got to reach the necessary pressure on each piece of fuel gas apparatus that may be used. The Welsbach burner requires the maximum. The higher pressure you get on the Welsbach the higher efficiency you get in your burner. As regard gas stoves, my judgment is somewhere around two inches as the minimum they should have, but the tendency of the gas business is to increase the pressure in order to get greater efficiency. Of course the objection to increased pressure is unaccounted for gas and leaks from mains, and no gas company wants to carry any higher pressure than they think is necessary to supply their consumers. You ask me frankly whether I think there need be any provision in the law as to high pressure, and I am frank to say I don't think there should be anything of the kind.

Q. That should be left to the companies themselves?

1895 A. That should be left to the companies themselves. I think so.

Q. Because no gas company would be willing to use the pressure as a means of compelling the consumer to pay for more gas than he actually burned?

A. Not unless he is the most shortsighted, misguided manager you could imagine, because it is a most foolish proposition. As far as a minimum pressure is concerned I can see there might be some propriety in that in making sure that the public would not be affected by danger from too low a pressure. I have known in my own experience where I have had too low a pressure, lower than an inch, and all I could do would not prevent it. That is generally the trouble by having a low pressure.

Q. So you think the law is objectionable because it is not only impossible to comply with but it is unwise?

A. If the State wants to pass laws, if I can obey them and know how to obey them I am going to obey them, as far as I am individually concerned; but when it comes to a question of my opinion I am frank to say that I think it is extremely unwise. If I could see any way of obeying this law I certainly would do so, as far as I am concerned, or recommend to the company to do so.

By Mr. Mathewson:

Q. You said that you tried to obey the law and found it impossible. What was the effect, so far as complaints coming into the company were concerned, with your attempt to keep inside the law?

A. Why, we had not only thousands of complaints, but in some of the cases we were threatened with suits on account of not supplying gas, people could not get sufficient gas for their purpose.

Q. The old flat flame burner required perhaps only an inch pressure to operate, did it not?

1896 A. It can be operated even under that; a half inch pressure could be used.

Q. But the new apparatus, such as the Welsbach and stoves, require——

A. They should have at least two inches pressure, and I think that for general use three inches would be better than two inches.

By Mr. **Page**:

Q. The reason of those complaints was largely because of the insufficient piping of the houses, wasn't it?

A. I don't know in every detail; I have not investigated every detail. I only know what the pressure was in the mains. I should think that if they had insufficient piping it would contribute to the difficulties that way, but to what extent I cannot say. You take the linotype machine, for instance, for a newspaper office—I think one of the very first to complain was a newspaper because they could not maintain the heat on their linotype machines on account of lack of pressure.

At one P. M., upon the Master declaring a recess for lunch, Mr. Burr requested that the rcess be extended till 2:30 P. M.

Recess until 2:30 P. M.

1897

After Recess.

The Master calls the attention of the counsel to the fact that an order has been made by Judge Lacombe extending the time of the complainant to present its evidence in chief twenty-one days from the 25th of August, 1906, with the further proviso that the complainant is to be allowed one full day and a half after the receipt of this order to complete its *prima facie* case, the witnesses being called and examined successively on the direct, without interruption. The balance of the extension granted by this order will be allotted the defendants for cross-examination, the special Master being given authority to extend such time five working days more, such extension however, to be deducted from the defendant's forty-five days.

Robert A. Carter recalled:

Mr. **Mathewson**: I have Mr. Carter here for further examination, if desired.

Mr. **Page**: As far as the State is concerned, there is no further cross-examination of Mr. Carter.

Mr. **Mathewson**: I furnished to Mr. Burr a statement of the funded debt of the company this year, and also of the fixed charges, and I am also furnishing him with the number of services in the ground, 1903, 1904 and 1905, and services relaid since those dates.

Mr. **Burr**: That is, you now hand me that paper.

Mr. **Mathewson**: Yes, I now hand you that paper. Much of the balance of the information for which you asked appears in the record already in one form or another, including the amount received from each company month by month, which has already been offered, and the amount of production of each manufacturing plant of the company, which also appears in the ex- 1898 hibit which we delivered to Senator Page, being for 1905, made up in the same form as Exhibit 145 of the Gas Commission Report for the nominal year ending October 31st, 1905.

Mr. **Page**: Has that been presented yet?

Mr. **Mathewson**: Hasn't it? I gave it to you the other day. I think you put it in evidence.

Mr. **Page**: Was that the 83 pages?

The **Witness**: No; I have a copy of it here.

Mr. **Burr**: You are going to furnish me with the information which is not already on the record, as you claim, is that it?

Mr. **Mathewson**: No, some of it we cannot. Your first request was for the capacity of coal gas plants in 1884. Mr. Carter is not an engineer, and is not familiar with it. Mr. Bradley probably will be able to tell you.

As to all contracts and vouchers for all holders constructed since 1884, giving the value of the holders, foundations and valve houses, that would be something we could not undertake to do. The vouchers are not in such shape that from them you could tell the exact cost of each holder in any event.

The number of services you have. I have given you those for six years past. I have given you the principal of the outstanding obligations and for each year, and the amount paid.

The average of the annual quotation for the bonds or debentures are accessible, and I understood that you could look at the quotations as well as we could hunt them up. We have no record of them in the books of the company.

1899 The amount of gas received appears, and the price paid for same to each company under the agency agreement appears by the exhibit already in, showing the amount of gas received, and by the agency agreement showing the price.

"The date of the largest sales in 1905;" Mr. Addicks explained this morning that that would be impossible to give, the exact sales per day. The best he could do would be an estimate.

"Manufacturing capacity of coal gas and water gas plants with which the Consolidated Gas Company has an agency agreement" has already been testified to by Mr. Bradley and Mr. Addicks.

"Monthly table of cost station by station," that appears in an exhibit which I have handed to Senator Page.

The question "Bring in all the bids, whether successful or not, in connection with holders constructed since 1884;" That we could not undertake to do. I do not think that we have them and I do not know that it would be material if we had.

The same as to the pipes.

Now, "Payroll for December, 1905;" that is a very extensive list, and Mr. Carter will produce such samples or such other illustrations as you may please, if you will indicate what you wish. I understood that your expert had checked them over and verified the statement that we presented, as far as he thought necessary.

"Produce the vouchers for holders built since 1895"; there would be a bushel basket full for each holder, and it would not lead to the full value or cost of the holder anyhow; they do not appear in the shape of vouchers.

Vouchers for oil for 1905 to 1906, up to September 1st.

1900 The record books have already been marked in evidence, showing that, or rather for identification, and all the deliveries have been read off, covering the period, before the Master.

"Give the age of all apparatus and buildings costing more than $1,000." That is impossible to give, but as far as possible it was generally testified to by Mr. Mayer, who had his statement as to when the apparatus was installed.

Mr. Burr: I said, leaving out those testified to by Mr. Mayer.

Mr. Mathewson: Now, I think I have covered all excepting those respecting which I have given you statement.

The Master: Is there any further cross-examination of Mr. Carter by you, Mr. Burr?

Mr. Burr: No, I have no further cross-examination now.

The Master: Then, Mr. Mathewson, your redirect, if you have any.

Redirect examination by Mr. Mathewson:

The Witness: In reference to some questions that were asked me last Wednesday, in connection with some figures prepared by Mr. Cuthbert, the expert accountant for the State, the item was a credit, aggregating, If I remember, something like $55,000 to the "expense, general office" account.

Mr. Mathewson: Take the exhibit and tell to which you refer.

The Witness: There was no exhibit showing that particular information.

Mr. Page: Analysis of general office expenses?

The Witness: That is it.

1901 The question was whether the full amount credited to that account during the year had not appeared as a charge in some other operating expense account and while I expressed doubt on the subject at the time, I was not able to say positively that the credit shown of $55,896.13 was not all charged to other operating expense accounts. I have investigated those credits since testifying and find that the amount credited to that account during the year, which appear as a charge in other operating accounts, was $28,876.60, the balance being adjusting entries and in no way distributing the expense over other accounts. In that connection, as the question comes up in connection with the item of "expense, general office," in Exhibit 94, and as there is a considerable difference between that item in Exhibit 94 for the calendar year 1905 and Exhibit 93 for the nominal year ending October 31, 1905, that is to say, some -63,176.29, I have combined three items appearing in Exhibits 93 and 94 to show the variation between the three items combined, the same items appearing each year in these combined items. In making the combination one of the clerks apparently did not in each year group the accounts in identically the same way, so that differences appear in these three items, expense, expense account general office, and advertising and legal, which are not differences at all except in the methods of grouping if the aggregate of the three items is taken. In other words, three items for the calendar year 1905, Exhibit 94, are made up as follows:

Expense	$490,855.36
Expense, general office	$339,999.51
Advertising and legal	$105,800.02
Total	$936,654.89

1902 The three items appearing in Exhibit No. 93, being the operations for the nominal year ending October 31, 1902, are as follows:

Expense	$583,278.52
Expense, general office	276,823.22
Advertising and legal	62,861.02
Total	$922,962.76

The difference between the two totals is $13,692.13. In other words, in combining these three items, the differences that appear in the individual items practically are eliminated in that total.

By Mr. PAGE:

Q. The question that I asked merely went to this, that the legislative investigation cost the company $77,806.76, and that the less credit was a distribution of $55,896.13 to other accounts, legal and advertising, and whatever the others were—expense, general office, and what was the other item you say——?

A. Expense, expense general office, advertising and legal.

Q. That the $77,806.76 was an expense that is properly chargeable to legislative investigation; that is right, is it not?

A. No, that is not the case, as it happens. The total expense in connection with the legislative investigation for the year amounted to $51,677.71, of which $28,876.60 was for legal services, which amount was taken out of the incidental expenses, account general office, and charged to legal expense and advertising. The balance represented other expenses in that connection, printing principally, and overtime of the clerks preparing statements, and expenses of that nature. The reason so large an amount appears in that
1903 statement, Senator, is because there was an error made in
charging into that expense account, general office, the sum of $27,019.53, which should have been a charge against suspense account, and it was the taking it out of the expense account, general office, and putting it in suspense account where it belonged that created so large a credit in the account. It simply corrected an incorrect journal entry.

By Mr. MATHEWSON:

Q. Is that all?

A. Just one moment. I was asked I think, by Mr. Burr, in connection with coal contract, marked City's Exhibit 23, to what extent the price stipulated in the contract has been affected by the variation in freight rate and in the mining rate, according to the terms of the contract. The contract was dated in 1903. In that year there was an increase of ten cents per ton in the freight rate, which operated to increase the cost of the coal from $3.50 to $3.60 per ton. In the following year there was a decrease in the mining rate of 5 cents, which under the terms of the contract operated to reduce the cost 7½ cents, bringing the price from $3.60 to $3.52½. In that year, however, we were getting a better figure from other companies and at our request they took 12½ cents more off the price of the coal, reducing it to $3.40 per ton. In the following year, there being a further reduction generally in the price of coal, they took 25 cents per ton off of the price, reducing it from $3.40 to $3.15, which price went into effect until the contract expired in 1906, the saving the company effected through securing these reductions in the price of coal amounted to some $90,000.

Q. You stated in your original examination that the cost to
1904 the company of meters, cocks, connections, &c., amounting to
$3,802,544.50, was divided between meters, cocks and connections and other items. Will you state the various items and the amounts of each making up that $3,802,544.50?

A.—

Meters	$2,941,037.07
Cocks and connections	313,714.47
Pipe and specials	113,259.64
Tools and implements	56,345.17
Office furniture and fixtures	39,708.73
Horses, wagons and harness	24,128.35
Scows	19,816.15
Automobiles and accessories	6,915.15
Gas stoves	287,619.77
Total	$3,802,544.50

Q. And you stated, from recollection that the estimate on the cost of reproduction of those upon current prices which the company is paying for such was something over four million dollars. Have you the exact amount?

A. Yes, $4,201,615.35.

Q. Does the company make any inventory of its pipes and specials?

A. Yes, sir, such an inventory is made annually.

Q. You were asked in reference to the time when the 10 cents per thousand was discussed, which was charged in the company's books from January 1st, 1905, to cover repairs and replacements and contingencies. Was it discussed at or before May, 1905, when the entries were made?

A. Yes, sir, it was.

Q. How long before that?

A. I cannot be exact as to the date, but it was some time in the fall of 1904 that the matter was first discussed.

Q. Was the 10 cents discussed at that time or some other figure, do you remember?

A. My recollection is that some other figure was discussed; that
10 cents was considered too small an estimate, too conserva-
1905 tive an estimate to provide against all of the contingencies
that were likely to arise, and I don't know but that it was
some time after that, before it was finally decided upon to use the 10
cent rate.

Q. Before the formation of the National Coke & Coal Company, how did the company provide for its cartage of coke?

A. The cartage was done by contractors who charged the company a given price per load.

Q. Do you know how the results compared to the company since the organization of this National Coal & Coke Company as to the cost of cartage and receipts of coke?

A. I would say in a general way that the dividends which we received represent the profit over and above what we would have paid the contractors under the old arrangement.

Q. Generally speaking, is the result more favorable to the company or less?

A. Much more favorable to the company. I might express that a little more definitely. The dividends are saved out of what we paid the contractors under the old condition, because the allowance to the coke company is approximately the same thing, so the dividends come out of that.

Q. In Exhibits 93 and 94, showing the coke produced, it appears that certain coke was delivered from one station to another. Isn't the coke charged to the station to which it is delivered?

A. The coke is.

Q. And credited to the station from which it is delivered?

A. That is the case.

Q. And it is charged and credited at the same figure?

A. At the same figure, yes, sir.

Q. So that in result it would make no difference what figure was used so long as it is both charged and credited in the final cost of gas?

A. That is the case, yes, sir.

Q. In reference to the gas received under agency agree-
1906 ments, if I understand you correctly; you take the amount of
the output of the company which makes the gas, and deduct
from that the amount which their own consumers receive as by their
consumers' meters and deduct leakage, and the balance is the amount
which the Consolidated Gas Company receive?

A. Yes, sir.

Q. And then that balance being delivered to the Consolidated Gas Company, the leakage occurs in the mains of the Consolidated Gas Company, and you compute that by taking the total amount of gas received and gas which leaves your stations, and from that total deduct the amount which the consumers' meters register?

A. Exactly.

Q. Is there any general interlocking of the mains of the Consolidated Gas Comapny and other companies except at the point where gas is delivered?

A. There is not, no, sir.

Q. By City's Exhibit E it appears that the amount of interest on taxes which is included in Exhibit 94 for the calendar year is $94,506.29. Does any portion of that accrue on the portion of the tax relating to the income from securities of other companies or tax on excess dividends invested in securities of other companies amounting to about $62,000 or $63,000 in total?

A. None whatever.

Q. Does this interest represent interest on taxes which you have failed to pay because they were overlooked or you did not desire to pay them, or on taxes which are contested by the company?

A. On taxes that are contested.

Q. Do you pay your taxes so as to get the advantage of any rebate?

A. Always, when we pay them.

Q. Under what advice, if any, were these taxes contested on which the interest of $94,000 and over accrued?

A. They were contested upon advice of counsel.

Q. That they were legal points?

1907 A. The consideration that there were assessments concerning which certain legal points should be decided by the courts before the taxes were paid.

Q. Legal questions which counsel advised should be determined by the court?

A. Yes, sir, that is the case.

Q. And have you contested any of these taxes without such advice?

A. In no case, no, sir.

Q. It is in evidence I think that the amount of assessment for taxation for your special franchises including mains and services in streets for 1906 is $31,900,000. Have you the amount of the assessment for 1905?

A. In 1905 it was $27,300,000.

Q. And what increase is that?

A. $4,600,000.

Q. At the tax rate prevailing in 1905, what increase in taxes would that make on account of your franchises for 1906 as compared with 1905?

A. The additional tax would amount to $68,563.87 or .52 of one cent per thousand cubic feet sold during the year 1905.

Q. And in 1906 is there any other special or additional assessment of a character which was not levied in 1905?

A. There was, yes, sir; assessments aggregating $5,455,000, which differ from any assessments that have ever been levied against the company before.

Q. Were there never any assessments of any corresponding character before?

A. Never, no, sir.

Q. And at the tax rate for 1905 what would be the tax if sustained?

A. $81,307.81 or .61 per thousand cubic feet of gas sold during 1905.

Q. And the total of these two items would be how much in money and in cents per thousand?

A. $149,871.68, equal to 1.13 cents per thousand cubic feet.

Q. You have been questioned in reference to the entries in your books in reference to gas sold to the city. The contract during this period called for how many feet of gas per lamp per hour? 1908

A. Three cubic feet per lamp per hour.

Q. And that was the amount which you could charge to the city under the contract, wasn't it?

A. That is the case, yes, sir.

Q. And was that the amount you entered in your books as a charge against the city?

A. The entry is not made in the books in connection with any charge, Mr. Mathewson; it is only for statistical purposes. The quantity supplied the lamps is estimated for the purpose of determining the total volume of our sales, and as the contract called for that quantity, we estimated that quantity although——

Q. When you arbitrarily separated the item of lamps and maintenance?

A. Yes, sir; that is the case.

Q. Do you know what the tests show as to the amount which the lamps do burn?

A. Yes, sir; the tests were made that indicated that the Welsbach burners——

Q. Well give a unit. I do not care for the details.

A. Well, they would use on an average from recollection 3.77 cubic feet of gas per hour; the ordinary flame burner would use considerably more than that.

Q. Taxing Exhibits 93 and 94 and various items therein, charged to manufacturing and operation of gas, is there any duplication of expenses in any of those items?

A. None whatever.

Q. Have you computed at 3¾ feet per hour as the basis of lamp burning, whether there would be any balance in your favor or against you on this $289,000 item that appears as street lamps?

A. On that assumption we would have lost $28,645.33, that is, we would have had but $260,614.26 to pay for maintenance and other lamp expenses amounting to $289,259.59.

Q. So on the computation of the gas actually delivered to the city that would be the result according to your test, would it? 1909

A. Yes, sir.

Q. Referring to the tax to the State Comptroller upon excess dividends over 4 per cent. and upon gross earnings, can you reach for the calendar year 1905 any closer amount than the amount assessed for the year ending November 1st, 1905?

A. No, sir.

Q. Have you a statement of the amount which has been actually expended at Astoria for that construction? Mr. Bradley testified to some figures.

A. Yes, sir; the amount actually expended to June 30, 1906, was $6,979,545.31.

Q. Mr. Bradley's figure was slightly higher than that by a few thousand dollars. Can you state how the difference occurred?

A. I think Mr. Bradley in his figures possibly included the uncompleted contracts.

Q. Yes he did.

A. They would amount to $1,460,974.97, that would make a total of expenditures and uncompleted contracts $8,440,520.28 and the difference between these figures and those that were testified to by Mr. Bradley is the cash and accounts receivable that he included as expenditures, although the Astoria Company had not actually expended them. He took into account the amount that the Consolidated Gas Company had advanced to the Astoria Company, assuming it all to have been expended. As a matter of fact they had some cash on hand and some money due from sundry parties that we have excluded as not having been actually expended upon plants or upon lands.

Q. His figures were the investment of the Consolidated Gas Company in what they had advanced to Astoria?

A. That is the case, yes, sir.

Q. And your figures now are the amounts the Astoria Company had actually expended, including the cash and accounts receivable which had not yet gone into the plant? 1910

A. That is the case, yes, sir.

Q. Mr. Carter, you were asked by counsel for one of the defendants whether you made an affidavit and an affidavit in rebuttal in this case and whether you referred to your familiarity with the report of the legislative committee of 1886 and stated that their investigation into the affairs of the gas company lasted nearly a year, and whether you called attention to the haste in which the investigation before the Stevens Committee was conducted and whether you quoted from the majority report of the committee to sustain your contention as to the proper valuation of the property by the constituent companies. Have you that affidavit before you?

A. I have.

(Witness produces paper.)

Q. I will ask you to define what portions of that affidavit refer to the matters respecting which counsel examined you and show precisely what you did state.

Mr. Burr: I object to that, if your Honor please.

The Master: Does not that show for itself?

Mr. Mathewson: I ask him to define the portions. I propose to offer them in evidence, and to have him state what he did say.

Mr. Burr: He admitted everything he did say upon which I asked him on cross-examination.

Mr. Mathewson: No.

Mr. Burr: He was asked categorically in reference to certain statements made in that affidavit and he was asked if that was his opinion now as it was then and he said it was his opinion. 1911

The Master: It would seem to me that the affidavit speaks for itself. If you want to offer it in evidence, very well, but it is before me under the equity rule. I sustain the objection. The witness can answer, of course.

Q. Well, will you state the portions now?

A. Shall I read it?

Q. No, you need not read it; state the folios beginning with the words.

A. On page 37 of complainant's affidavit in rebuttal beginning with the sentence, "The Senate Committee of 1886, Senate Document 47, of that year, completely sustained the value of the company's assets at that time."

Q. Over to?

A. To page 39, ending with the words "its property rights, in behalf of which it has sought the interposition of this honorable court."

Q. And will you point out the portions of it prior to that, in which you refer to the decision of the Committee of 1886, and quoted its report?

A. On page 25, beginning with "in 1885 the Senate of the State of New York appointed a Committee," and ending at the bottom of page 27, "and upon the finding of said committee, that such provisions had not been violated."

Mr. MATHEWSON: Without taking time to read it, Mr. Master, and as a shorter way, I offer in evidence the portions of the affidavits to which the witness has referred.

Mr. BURR: I object to that because it embraces many things about which he was not examined in this regard.

Mr. MATHEWSON: Not a thing.

The MASTER: Do you want to have it printed in later or marked as an exhibit?

1912 Mr. MATHEWSON: Perhaps the shorter way would be to mark it as an exhibit.

The MASTER: I will take it.

Mr. PAGE: I object to it on the ground it is incompetent, irrelevant and immaterial, and not the proper way to prove the facts where a witness is on the stand.

Objection overruled; exception.

Mr. Burr and Mr. Page except.

Mr. MATHEWSON: There is no objection that I have the printed copy here instead of the original affidavit?

Mr. PAGE: No.

Papers received in evidence and marked Complainant's Exhibits 225 and 226.

Q. You were asked in reference to the war of 1899 and 1900 between the Consolidated Gas Company and some other companies and were asked how low the gas was sold in those years. Can you give the average rate at which gas was sold in 1899?

A. That is one of the exhibits, Mr. Mathewson. I am not sure that I have got it. The average cost in 1899 was 84.56 cents per thousand cubic feet.

Q. And in 1900?

A. In 1900 the average price was 82.46 cents per thousand cubic feet.

Q. You were asked also whether there was any surplus in 1899 and 1900, and you replied that there was. What did you mean by surplus, as you used the term?

A. I mean that there were earnings over and above the fixed charges. I did not mean that there was any surplus over dividends that were paid during those two years, because as a matter of fact in both years the dividends exceeded the available surplus for the year, some seven hundred thousand dollars, I think, the first year, and over a million dollars the second year, that is in 1900.

Q. You were asked in reference to the competition of the
1913 companies in which the Consolidated Gas Company holds
stock. Did you observe any diminution in the competition of the electric companies since the Consolidated Company owned their stock?

A. None whatever. On the contrary.

Q. Is not that business being steadily pushed as far as your observation goes?

A. Very steadily and increasing very rapidly, and of course at the expense of the gas business to a great extent.

Q. You were asked also as to a contribution to Employees' Aid Society and the superannuation fund, vacation and sickness charges, and you were asked whether that was not a unique expenditure with you. What is your information in regard to such charges by other companies?

A. In corporations similar to ours, that is almost the universal practice to make provision of that kind.

Q. Where there is an ordinary vacation or where an employee is absent on account of illness for a short period, do you dock him for that?

A. No, sir, we do not.

Q. I want to ask you too, in reference to these expenditures what the effect is upon the character of the employees that you are able to get and the service they render?

A. We believe, and there is no doubt in my mind whatever, that it operates to improve the character and efficiency and service-ability of the company's employees throughout, and we are enabled to have a better grade of men and able to get more work done, as a matter of fact.

Q. In the production of your product, do you consider it then an economical and wise expenditure?

A. Most decidedly, yes, sir.

Q. You gave certain meter prices to Senator Page or Mr. Burr. Did the prices which you gave him include the setting of meters or merely the meters unset?

A. Unset.

1914 Q. Can you state what the assessment of the company was
on real estate, including its land and buildings for the year
1904 by the city assessors?

A. In the year 1904 the real estate was assessed at $13,451,000.

Q. That included both land and buildings, didn't it?

A. Land and improvements, yes, sir.

Q. And what did your statement to the city at that time show, made up upon the basis to which you have heretofore testified, taking the land value plus one-half of the plant?

A. Something more than $19,000,000.

Q. After you had these figures given to you in regard to mains, services and plant in 1902, did you make up the report to the local tax assessors and to the State Tax Board on the same basis thereafter?

A. Yes, sir.

Q. With whatever change might occur in the assets meanwhile between the two reports?

A. That is the case, yes, sir.

Q. You were asked in reference to the premium of something over $23,000,000 at which the stock was issued in addition to the premium on $14,322,000 which appears on the books? Is there any record kept from which it is possible to tell just what the amount of that premium is from which you made your statement?

A. Yes, sir, there is, decidedly.

Q. The securities themselves, you said were marked down to par value, however, in the books?

A. The par value of the stock of the Consolidated Gas Company that was issued, yes, sir.

Q. Except $14,372,000?

A. That is the case, yes, sir.

Q. You were asked whether Exhibit 172 before the Gas Commission showed the increase to December 31st, of the property of the company to be $9,431,198.52. Does that include any increases of
materials or supplies or cash or is it merely an increase in
1915 respect to the items shown in that exhibit?

A. That is the case. What we would term "plant" only.

Q. There are no materials and supplies or cash or accounts receivable there?

A. No, sir.

Q. And is the same true as to the $9,693,565.90 which appears in Exhibit 89 on this hearing?

A. Yes, sir. That is the case.

Q. And in addition to this $9,693,565.90 was there not a further addition to those items between June and November, 1884, of $196,419.01?

A. That is the case; yes, sir.

Q. The counsel for the city has offered in evidence as City's Exhibit 31, page 776 of Senate Document 47 of 1886, including the column headed "Cost of Property." Do you know at what figure the plants of the Manhattan Company were carried into that "Cost of Property"?

A. My recollection is that it was about $64,000.00.

Q. That is the plant at 18th and at 14th Streets?

A. 18th and 14th Streets. Those plants have a capacity of about seven million cubic feet per day combined.

Mr. **Page**: On what does he base that statement of his that it is carried in that figure?

Mr. **Mathewson**: On the same report.

Mr. **Page**: He certainly does not, because that report states it entirely differently.

Mr. **Mathewson**: No, I think not.

I offer in evidence the report of Messrs. Robinson & Murphy, constituting a majority of the Senate Committee of 1886, from Senate Document 47 of 1886, page 776, of which has been offered by the city.

1916 Mr. **Burr**: I object to it being offered in that incomplete way, because the report of the majority refers to its agreement with the conclusion arrived at by the minority, Senator Gilbert, and if it is going to be offered in evidence at all I insist that the whole report shall be offered.

Mr. **Mathewson**: I offered the report of the majority of the committee.

The **Master**: Well, I will take it.

Mr. **Burr**: Will you take the offer in evidence of the whole report?

The **Master**: I will take the whole report, yes.

Mr. **Mathewson**: I object to his offering the whole of that report in connection with my examination.

The **Master**: We might as well take it while we are on the subject.

Mr. **Mathewson**: All right, sir.

The portion of the report offered by Mr. Mathewson is received in evidence and marked Complainant's Exhibit 227.

The portion of the report offered by Mr. Burr is received in evidence and marked City's Exhibit 45.

Q. What was the date of the first session of the Stevens Committee, the joint legislative committee of 1905, and when was the last public sitting?

A. The first was on March 30, 1905, and the last on the 21st of April, 1905.

Q. Referring to the assessment of $31,900,000 for the company's special franchises for the year 1906, you were asked in reference to the order fixing the price of gas at 80 cents. It appears that the order was made February 23; did the company receive any notification before or after that date of such a tax?

1917 A. Two notices, both subsequently to February 23d; the first one being dated March 1st, 1906, advising the company that the Board had made an assessment upon the special franchises of the company, fixing the value at $31,900,000, and a second notice dated March 28, 1906, advising us of a final assessment of the same amount, $31,900,000.

Q. The first notice invited the company to make objection if they had any to make to the assessment before it was finally fixed?

A. Yes, sir.

Q. Did the company appear thereafter by counsel?

A. It appeared by counsel.

Q. And the final assessment notice of March 28th followed.

A. Yes, sir.

Q. Is there any method by which you can distribute your distribution or general expenses over the various plants, apportioning them at so much to each one?

A. No, sir; except by an arbitrary method that would simply deal with the general ratio of the sales to the make, applying it to the different stations, but the results would not be particularly satisfactory and would not indicate actually the results in connection with each plant.

Q. Referring to the exhibits relative to the franchises of the company, beginning with the exhibit, grant to the New York Gas Light Company, and concluding with the State grant of 1871, which were offered in evidence here, in whose custody have those been since the company was formed in 1884?

A. In the custody of the secretary of the company.

Q. Had they come into the hands of the Consolidated Gas Company from the constituent companies at that time?

A. They did, yes, sir.

Mr. Burr: I submit he cannot testify that they came into the custody of the secretaries of the company and that they remained with each secretary for all the years from 1884, prior to the time he became secretary. He might testify for himself, but certainly
1918 he cannot testify positively to the possession of them by other
people years ago.

Q. Were they in the files of the secretary when you became secretary?

A. Yes, sir.

Q. And what is your information as to them before that time?

A. They have always been in the files of the company since consolidation.

Q. Exhibit 143 before the Gas Commission has been offered here as City's Exhibit 41. Will you find the exhibit in that volume?

A. I find the Exhibit 43 in the printed record before the Gas Commission.

Q. That you stated was a copy of memorandum which you had, a comparison of certain items of cost, one month as compared with the corresponding month the preceding year?

A. That was the case, yes, sir.

Q. Now, did you state before the Gas Commission that that was not a complete statement of cost?

A. I did, yes, sir.

Q. Does the 14th Street station, for instance, have they any items indicating the cost of oil or the oil gas at 21st Street which enriches the gas?

A. No, sir, neither 14th Street nor 21st Street have that cost included.

Q. So that that exhibit is to be taken as a supplementary comparison and not as complete?

A. That is the case, yes, sir.

Q. Now, taking Exhibit 147 of the Gas Commission, which is City's Exhibit 42, certain prices are given there for meters. Is that the price for meters set or meters delivered to the company?

A. This is the price for meters delivered to the company.

Q. How about Exhibit 148?

A. It is the price delivered and does not include the connections.

Q. You were asked in reference to the payment by the
1919 Standard Oil Company representing an adjustment between
the rates of a previous contract and the rate of a subsequent
contract for oil at a lower figure. Does that payment operate to reduce the cost of material or the amount of material for that year?

A. It does, yes, sir.

Q. So that in making up the cost of gas the material that went into the cost would appear with that $119,000 deducted, would it?

A. Deducted, yes, sir.

Q. Are you familiar with the employees of the accounting department, the general office of the company, and with their salaries or compensation?

A. Perfectly.

Q. Who employs them?

A. A great many of them I employ myself.

Q. Are any men employed there whose presence is not necessary to the work of the company?

A. Not one.

Q. How about their compensation?

Q. It is at as low a figure as we can secure the kind of help that we have got to have to do the work and do it properly and correctly.

Q. You have general charge of the books of the company, have you not?

A. Yes, sir.

Q. The vouchers for money paid, etc.?

A. Yes, sir.

Q. I want to ask you generally whether there are any expenditures made by the company for labor and material, so far as you know, which are not required?

A. Absolutely none.

Q. Or for which a higher price is paid than is necessary?

A. In no case.

Q. Has the company many customers of small means or small consumers?

A. A very great many, yes, sir.

Q. Are there any actions pending against the company for penalties on account of this pressure law?

A. There are actions pending at the present time to recover
1920 penalties under the law fixing the pressure at which the
company shall carry the gas in the mains, aggregating, as
far as I am able to find out at the present time, $46,000. There are two actions, one of September, 1905, and one of January, 1906, where no sum was named. In two other actions, one of January, 1906, and February, 1906, penalties aggregating $46,000 are named.

Q. Do you know how many customers the company has?

A. About 390,000.

Q. And if the company were to make a charge at higher than 80 cents to each one of those and be subject to a thousand dollars penalty for each offense, how much would that make per month?

A. $390,000,000.

Q. And how much in a year?

A. $4,600,000,000.

Q. How many stations are tested for pressure by the city, do you know?

A. How many gas stations?

Q. Yes.

A. All of them as I understand.

Q. What would the penalty be at a thousand dollars a day, for pressure, assuming that the pressure should vary outside of from one to two and one-half inches each day.

A. $5,000 a day.

Q. How much would that be a year?

A. $1,800,000 a year.

Q. What is the amount of loss per day in your gross revenue if the price of gas is reduced from one dollar to 80 cents, generally speaking?

A. About $2,600,000 in round figures.

Q. A year?

A. A year, something more than that to be exact.

Q. According to statements presented, over 50 per cent. of your net income?

A. Over 50 per cent. of our net income, yes, sir.

Mr. PAGE: You qualify that as Mr. Mathewson did "According to papers presented here?"

1921 Mr. MATHEWSON: I assume that he would have to act on those. As a matter of fact it would be about 75 per cent.

Q. You were asked by counsel whether you concurred in the opinion of Messrs. Walton Clark, Emerson McMillan, Allen B. Forbes, Charles S. Fairchild, Frank A. Vanderlip, Horace J. Morse and N. Wetmore Halsey, as expressed in their affidavits upon the motion for injunction herein.

Mr. PAGE: That is objected to on the ground stated when the same question was put before.

The MASTER: He has not asked any question yet.

Q. Have you those affidavits before you, and will you point out the portions of each affidavit expressing the opinion in which you state concurrence.

Mr. BURR: I object to that; that is not the way to get the evidence of these gentlemen into the record.

The MASTER: I sustain that, as I did before, with the statement that he can offer the affidavits if he wants.

Mr. MATHEWSON: I will offer that portion of the affidavit after he has identified it.

Mr. PAGE: I object to it on the same ground as stated when this line of examination was taken up by Mr. Mathewson before, and I call attention to the fact that he is threshing over old ground that has been gone over several times by myself and Mr. Burr and the rest of us, and is consuming time.

Mr. **Mathewson**: I did not begin this.

The **Master**: I sustain the objection.

Mr. **Mathewson**: I will ask him to point out the portions; is that sustained?

The **Master**: That is sustained.

1922 Mr. **Burr**: That is the same objection I made before.

A. On page 52 of the affidavits and notice of motion, the affidavit of Walton Clark, beginning "as a result of my experience" and ending "the investment in new gas works in New York City."

Q. Whose affidavit is that?

A. Walton Clark's.

On page 54, paragraph 5, the affidavit of Emerson McMillin, beginning "I am fairly familiar with the market value of the stocks and bonds of gas companies," and ending on page 57, with the words "special hazards hereinbefore referred to."

On page 59, in the affidavit of Allen B. Forbes, beginning with the first line of paragraph 6, where it says "in the case of gas and electric companies," and ending on page 60, the end of the affidavit, finishing with the words "taxes and other fixed charges."

Page 61, affidavit of Charles S. Fairchild, beginning paragraph 2, "I have read the affidavit of Allen B. Forbes," and ending on page 62 with the words "property of the company engaged in the business."

Page 63, affidavit of Frank A. Vanderlip, beginning paragraph 2, "I have read the affidavit of Emerson McMillin" &c., and ending on page 64 in the same paragraph with the words, "of the company engaged in the business."

Page 69, affidavit of Horace J. Morse, beginning with the second paragraph, "I have read the affidavit," and ending on the same page, "property of the company engaged in the business."

Page 71, beginning with paragraph 3, affidavit of N. Wetmore Halsey, beginning, "I have read the affidavit of Allan B. Forbes herein," and ending on page 72, the middle of the same paragraph, "of the company engaged in the business."

1923 Q. Were those the opinions in which you stated you had no hesitancy in concurring?

A. Yes, sir.

Mr. **Mathewson**: I offer those portions of the affidavits referred to in evidence.

Mr. **Page**: Objected to as incompetent, irrelevant and immaterial, and an improper way to prove the statements made by those persons, and further, if their opinion or testimony is to be received, it should be brought here and be subject to cross-examination.

The **Master**: I do not understand that they are offered for that purpose and they are certainly not received for that purpose, and in admitting them I do not admit them as proof of the facts contained in them. I admit them as part of the redirect-examination of this witness and for the purpose of explaining or qualifying statements that he may have made on his cross-examination, when his attention was called to these documents by the cross-examining counsel. That is the only purpose for which they are admitted.

Mr. Burr: I join in that objection.

Mr. Page: You will remember that on cross-examination the State objected to questions asked on cross-examination by the District Attorney.

The Master: That is the difficulty of having two counsel on the defendant's side of the case.

The objection is overruled.

Exception *to* Senator Page and Mr. Burr.

The portions of the affidavits identified by the witness are received in evidence, collectively, as Complainant's Exhibit No. 228.

Mr. Mathewson: I have here a statement of the price at which
gas was sold for each year all the way down. I think Mr.
1924 Burr asked for it at one time and I did not have it. You
will remember that it was put in as to the amount of sales,
but not the price each year. Is not that so, Mr. Carter?

The Witness: Yes.

Q. Have you a statement of the average rate per thousand received for gas by the company from its formation in November, 1884, to 1905, inclusive?

A. Yes, sir.

Q. It is already in evidence for 1905, and some of those other years, is it not?

A. Yes.

Q. And what were they?

A.—

Year.	Rate per M sold.
1884	$1.6854
1885	1.6976
1886	1.4642
1887	1.2589
1888	1.2566
1889	1.2563
1890	1.2568
1891	1.2555
1892	1.2549
1893	1.2547
1894	1.2550
1895	1.2552
1896	1.2556
1897	1.2213
1898	1.1518
1899	.8456
1900	.8246
1901	.9994
1902	1.0004
1903	1.0006
1904	.9998
1905	1.0202

1925 Q. The sales year by year of the Consolidated Gas Company appear, do they not, in exhibit Complainant's 85?

A. Yes, sir.

Q. Have you prepared a statement of the same character as that delivered to the Gas Commission, showing the cost of gas of the Consolidated Gas Company's own make and of that received by it from other companies for the four months July, 1905, to October 31st, 1905?

—. Yes, sir.

Mr. **Mathewson**: I offer it in evidence.

Received in evidence and marked Complainant's Exhibit 229.

Recross-examination by Mr. **Page**:

Q. Can you give the exact amount by which your surplus was depleted, or in other words how much the dividends in 1899 exceeded the amount of earnings properly applicable to dividends?

A. I did not give the exact amount. I can furnish you with that. I testified that the deficit for the year 1899 was something approximating $700,000, and for the year 1900 something over $1,000,000. If you would like those figures exact I will prepare them for you.

Q. I would like to have them for those years. In 1899 you paid a dividend of 5½ per cent., and in 1900 a dividend of 6 per cent, did you not?

A. Yes, drawing upon the accumulated surplus for that purpose.

The **Master**: If there is to be any cross-examination of Mr. Carter for any appreciable length, under the direction of the court we will have to defer it and take the next witness on the direct. If you have only a few questions we might as well go on and complete with Mr. Carter.

Mr. **Page**: I will suspend with Mr. Carter.

1926 Mr. **Burr**: Mr. Mathewson covered a great deal of ground with Mr. Carter and he has made some very positive statements on which it will be necessary for us to cross-examine him, but in view of the order made, and the ruling, I shall not cross-examine him now.

The **Master**: Have you another witness, Mr. Mathewson?

Mr. **Mathewson**: Yes, but I am afraid you will be without a witness early in this afternoon.

Colin C. Simpson, recalled and further examined, testified as follows:

Redirect examination by Mr. **Mathewson**:

Q. You stated that pipe in 1885 for mains was lower than in 1905. How was it in 1884?

A. Very much higher.

Q. Do you know whether at times prior to 1884 pipe was higher still?

A. Very much higher still.

Q. As high as what?

A. $60 a ton.

Q. Did you give Mr. Carter any figures in reference to services in the tax report?

A. I did not.

Q. What would you say, as to the valuation for services, $600,000 or thereabouts, services of the Consolidated Gas Company, as they appear in the tax reports?

A. It is an absurd figure.

Q. Did they come from the engineering department at all, as far as you know?

A. No, sir; they did not.

Q. You have already testified as to the value of mains?

A. I have.

Q. Can you state what the value of the mains as material only would be at this date, unlaid?

A. Yes.

1927 Q. How much?

A. The value of the pipe specials and lead which comprise the mains, leaving out the yarn or anything of that kind, or blocking, or valves would approximate $4,300,000; over $4,300,000.

Q. That would be without any laying at all, even in soft dirt.

A. Without any laying at all.

Q. You have seen the figures of the tax report, have you not?

A. I have.

Q. Does that in any way modify your testimony as to the value of mains to-day?

A. Not one bit, sir.

Q. Mr. Carter stated that the figures were handed to him in reference to mains in 1902. Is that your recollection?

A. Yes.

Mr. Burr: I would like to ask him one question because of my personal solicitude about the matter.

By Mr. Burr:

Q. Since you were here last, have you heard anything as to the whereabouts of those poor, abandoned mains that you set adrift without a chart or compass?

A. I could tell you, if you want to know, in a general way, where they are. There are abandoned mains probably on 33 per cent. of the streets of Manhattan—from 25 per cent. to 33 per cent. It might not be an entire block; it might be a piece of this block and a piece of that block. Those mains range in size anywhere from an inch and a half to even some twenty inches. For instance, there is a 20-inch main on Eighth Avenue, from 59th Street to 65th Street; that is under the car tracks and cannot be reached; it has to be abandoned.

Q. In other words, they have gone to pieces?

A. No, they have not gone to pieces. The material is there. I suppose they would have to be looked after if you wanted to use them.

Q. Does that make up the 70 miles above the 822 miles
1928 that you have testified to?

A. The different abandoned mains scattered all over Manhattan make up that 70 miles.

By Mr. MATHEWSON:

A. I understand that none of the abandoned mains are included in the 822 miles of mains about which you have testified as to values?

A. Not one inch of them.

The MASTER: Any cross-examination of Mr. Simpson.

Mr. BURR: I have no questions to ask further than that.

The MASTER: Any cross-examination, Mr. Page?

Mr. PAGE: Yes, I have some cross-examination that I suppose will have to be reserved under the rules.

Mr. MATHEWSON: Can he not complete with the cross-examination of Mr. Simpson? He has been down here several times.

The MASTER: If it is not very long I suggest that it be completed.

Mr. PAGE: I am going to submit to the ruling of the judge.

The MASTER: If you will state whether your cross-examination is lengthy or not I will take the responsibility of disposing of it.

Mr. PAGE: My cross-examination will be somewhat lengthy.

The MASTER: Then we will go on with another witness.

1929 ALEXANDER C. HUMPHREYS, called as a witness on behalf of the complainant, being duly sworn, testified as follows:

Direct examination by Mr. MATHEWSON:

Q. Where do you reside, Doctor?

A. New York part of the year, and part of the year in Glen Cove.

Q. Are you a graduate of any engineering institution?

A. The Stevens Institute of Technology.

Q. Do you hold any position with relation to that Institute now?

A. President.

Q. How long have you been president?

—. Since 1902.

Q. Have you ever been engaged in the gas business in any authoritative position?

A. I have been so engaged since the year 1872 continuously.

Q. Will you state what your first connection with that business was?

A. I entered the business as secretary and treasurer of the building committee of a suburban company; the next year, upon the completion of the works, I was made secretary and treasurer of the company; the next year I was made superintendent in addition. A couple of years later I appreciated that I needed a technical education to enable me to go as high as I wanted to go, and entered the Stevens Institute as a freshman in 1877, carrying on my work for the gas company at the same time and carrying on work at the Stevens Institute chiefly by night study, graduating in 1881. At the end of 1881 I was made chief engineer of the Pintsch Lighting Company, now succeeded by the Safety Car Heating and Lighting Company, and in that position I had charge of the building of their oil gas works, and the fitting of cars, steamboats, light houses, buoys, to light them with compressed oil gas delivered at high pressure and governed to the burner pressure by special devices. In that connection I made a special study of candle powers and pressures. 1930 In 1885, the first of the year, I was made superintendent of construction of the United Gas Improvement Company, Philadelphia, at that time the operator of about ten works scattered throughout the country. Three months later I was made general superintendent, and given control of the operation of the works as well as construction. Then, the next year or so, about 15 works were added to my list. Within a year or two I was given control of all the commercial details, and in that position I had charge of the developing of a uniform system of accounts under which the United Gas Improvement Company operated and practically operates to-day. In 1892 I organized the firm of Humphreys & Glasgow of London, to engage in the construction of water gas plants. In 1884 I resigned from the U. G. I. and organized the firm of Humphreys & Glasgow of New York, to engage in the business of consulting and supervising engineering for gas companies, advice as to the management of gas companies, and to take up the management of gas companies and I have been continuously engaged in the affairs of those two firms since 1892 and 1894 respectively.

Q. When you were general superintendent of the United Improvement Company, what general duties did that cover?

A. It covered the entire engineering of all the works under the control of the company and all the commercial details of those companies up to the time the reports were carried into the main office at Philadelphia; and also for the last five years, which I forgot to mention, covered the charge of the contracting department through which the company contracted to build plants for outside companies.

Q. How many plants did the United Gas Improvement Company have at the time you left it, over which you had such control? 1931

A. About fifty.

Q. Had some of those been constructed by the company under your supervision?

A. Some of them, yes, and all of them added to.

Q. Had your firm of Humphrey & Glasgow erected gas plants or gas apparatus on this side of the water?

A. On this side?

Q. Yes.

A. A few, yes, sir.

Q. Have they erected any on the other side?

A. A great many.

Q. Will you name some?

A. Very large plants for the Gas Light and Coke Company, which is the biggest company in London, smaller plants for the Commercial; of London, Manchester, Birmingham, Liverpool, Brighton, Bournemouth, Southampton, Edinborough, Glasgow, Belfast, Dublin and many more in Great Britain. On the other side of the channel, Utrecht, Rotterdam, Brussels, Berlin, Vienna, Budapest. Going much further, Shanghai, Sydney, Australia, Dunedin, New Zealand and not less than 125 in addition.

Q. What proportion, if you happen to know, of the water gas plants outside of the United States, that is, in the rest of the world, has your firm constructed?

A. I don't remember figuring it up of late, but I should think from my general knowledge, 75 per cent.

Q. During the past 20 years, in addition to your practical experience in the gas business, have you made any study of economic questions involved in the conduct of the gas business?

A. I have.

Q. And of gas accounting and depreciation?

A. I have made a special study of those subjects.

Q. And of capital and interest returns?

A. Yes.

Q. Are you connected with any engineering societies, doctor, and will you waive modesty and state some of them?

1932 A. Well, I ought to put at the head of the list, I suppose, although I am an American now, the Institution of Civil Engineering of Great Britain; The American Society of Civil Engineers; The American Society of Mechanical Engineers; The American Institution of Mining Engineers; The British Association for the Advancement of Science; American Society for the Advancement of Science; American Chemical Society; Society of Chemical Industry of the World, American Gas Light Association, of which I am a Past President; Western Gas Association; New England Association of Gas Engineers; Pacific Coast Gas Association; Ohio Gas Association; Society of Gas Lighting of New York, and some others; I don't remember them all.

Q. Are you familiar in general with the plants of the Consolidated Gas Company in the City of New York?

A. Quite familiar with them, yes, sir.

Q. Have you ever examined them?

A. I have.

Q. Did you examine them for the purpose of making an estimate of value?

A. I did.

Q. How recently did you make that examination?

A. My personal examination was back last winter, somewhere around Christmas, to my recollection. I have had an examination made since by proxy, an exhaustive one.

Q. By your office?

A. By my staff under the charge of my chief engineering assistant, that is, the chief engineering assistant in the New York firm.

Q. Are you familiar with the provisions of Chapter 736 of the Laws of 1905, and of Chapter 125 of the Laws of 1906 of the State of New York, providing that the pressure in the "service mains" of the company shall never be less than one inch or more than two and a half inches?

A. Yes, sir.

Q. What is your view as to the possibility of complying with that provision?

A. Practically impossible.

1933 Q. As to ammonia and sulphur provision. Is it possible to operate plants indefinitely, taking coal which you have to get and always keep within those requirements?

A. Why, I suppose it would be possible with human nature strung up to the very finest point, but I don't think in practice we would ever find a company running without some failures, and especially in a time of stress, where they had to get a coal which was rich in sulphur compounds, outside of sulphuretted hydrogen. Of course the penalty is a very severe one.

Q. What is your estimate and judgment as — the value of the plants of the Consolidated Gas Company which are located on Manhattan, including manufacturing plants and holders?

A. I did not attempt in the time at my disposal to come down to a specific figure, I thought it better to endeavor to see whether I could find any fault with the book figures, as I recall about sixteen million, eighty thousand odd dollars. My examination satisfied me that that was a reasonable figure. When I say reasonable, I mean that is a figure less than the value at the time, taking into account depreciation.

Q. What would be your estimate of the value in such round figures as you could make it, less such depreciation as you observe?

A. Do you mean now, at the present time?

Q. Yes.

A. With the figures that are before me from this examination that my firm has made, I should say that it was considerably above the book value. Those figures are not entirely completed owing to my chief engineer being called off on an emergency, at one of the works, for which we are responsible, a very severe emergency. The figures have not been completed, but they have been completed sufficienctly to satisfy me, and I should be entirely willing to testify under oath, as I am, that the present value, allowing for depreciation, is not less than $16,400,000, probably in excess of that. 1934

Mr. Page: Do I understand this is the plant and holders?

Mr. Mathewson: Yes.

Q. Assuming that an engineer after careful examination of details, had testified that the value was $17,100,000, what would you say to that figure?

A. If an engineer had done so?

Q. Yes.

A. I should want to know who the engineer was and a good deal about it; there is a very personal equation in such an estimate.

Q. Would that be a figure which would conflict with your views, so far as you had gone?

A. No, I think it is entirely possible that the very complete continuation of my figures would bring the figure very close up to that because I am extremely conservative in stating the amount I have.

Q. Assuming the sales of the Consolidated Gas Company for the past year to have been over 13,000,000,000 feet, and their receipts to have been over $13,000,000, and with the number of plants that they have, and as you know them, what would you consider a fair allowance for working capital, including cash accounts receivable and equipments and material?

A. About 30 cents per thousand cubic feet of annual sales.

Q. And at 13,000,000,000 feet, that would amount to about $4,000,000 wouldn't it?

A. Somewhere around $4,000,000.

Q. What is meant in the engineering profession by undistributed expense in connection with contracts?

A. In connection with contracts?

Q. Yes.

A. The items of expense that are not readily apportioned to each
individual plant, each individual contract, and which would
1935 come under the head of general expense; perhaps as the English accountant would put it, establishment charges.

Q. In figuring the final cost of the plant, is it necessary for the company to add any percentage for undistributed expense and engineering expense in addition to what it paid for contractors and installing its property?

A. Certainly it is.

Q. What would be the fair figure for that?

A. About 10 per cent. is the figure I have used.

Q. And how about interest?

A. It would depend upon the time to be estimated that the construction would take. Of course if it was two years, we would charge 5 per cent. and one year 2½ per cent.

Q. Taking the plants and holders of the Consolidated Gas Company as you know them, would you consider two years as an excessive period?

A. I certainly should not.

Q. Is there an item of undistributed expense also to be computed by contractors who install apparatus?

A. Certainly, on the same principle.

Q. And what would be a fair figure for their undistributed expense and engineering, according to your experience?

A. I could not generalize very safely on that, because it would entirely depend on the system of accounting followed by the concern. Of course the concern should, if possible, itemize on the different special items, different special contracts or whatever it might be and leave as little undistributed expense as possible. I can say as an example in my own firm in London where we do nothing but a contracting business and do not get any profits that do not come from contracts, the average since 1892 is a shade under 16 per cent. The accounting is under the direct charge of Spain Brothers & Company, some of the best accountants I suppose in England, and has been from the start, and that is the result of their and our effort to spread
on each contract as much of the general expense as they can
1936 possibly figure for that particular account, and still it leaves
somewhere between 15 and 16 per cent.

Q. That is after a distribution of all the items upon special contracts which the accountants could distribute?

A. Yes.

Q. How about the profits of a contractor, is that to be included in the cost of the contractor?

A. We hope so.

Q. And what per cent. would be fair for that, would 15 per cent. be excessive?

A. I should not like to talk from my own experience on that, but I should not consider 15 per cent. excessive.

Q. Taking a plant which has been built up, one plant or one section at a time, beginning, say, with 1825 up to date, is it possible to build such a plant in that way upon exactly the same lines which it would be constructed if it would be reproduced new to-day in toto?

A. Certainly not, it is a case of foresight and backsight.

Q. If you had benches of sixes working efficiently, would it in your judgment be wise to throw out the sixes and put in nines if they were in good condition?

A. Certainly not.

Q. Assuming that the Consolidated Gas Company had sales of 13,300,000,000 feet per annum, and that they were able to produce in their manufacturing plants only something over ten and one-half billion feet or less, would it be your judgment that it would be wise or otherwise to establish a plant for the purpose of taking care of the balance of their output?

A. I should think it would be wise to do so.

Q. Are you familiar with the situation at Astoria?

A. Fairly so.

Q. Assuming that the Astoria Light, Heat & Power Company were established for the purpose of manufacturing for the Consolidated Gas Company the balance of its gas sold which it cannot now
1937 manufacture in its own plant, what would be your judgment as to the computation of the investment at Astoria in the capital account of the company for the purpose of determining the selling price of gas?

A. Who would own the Astoria Company?

Q. The Consolidated Gas Company owning all the securities of every kind and using it as a manufacturing station?

A. Certainly, the capital belongs there just as much as the Manhattan plant does.

Q. Assuming that it organizes the National Coke & Coal Company and owns all the capital of that company for the purpose of carting its product, its coke, and selling it, thereby making a more economical arrangement than when it carted its own coke or hired outside contractors; and that the Consolidated Gas Company owns all the securities of the National Coke & Coal Company, would that in your judgment come in the same category as the Astoria Company?

A. Providing the company turned its profits into the gas company, which of course it would have to under the ownership of stock.

Q. Would it in your judgment be wise, Doctor, for the Consolidated Gas Company to wait until its output had reached the complete limit, before it established a plant to take care of increase, or began the construction of such a plant?

A. Certainly not. They ought to be turned out of office if they did.

Q. Are you familiar with the effects of electrolysis on gas mains?

A. Fairly so.

Q. Are you familiar with the conditions in New York, so far as relates to the use of electricity by the subway, the trolleys and the elevated, and the increase in currents?

A. Fairly so. I do not pretend to be an electrical expert, but am familiar with those conditions in connection with the gas business.

Q. From your knowledge and observation, Doctor, what would you consider as to the danger of whether there is any danger 1938 in the future through electrolysis to the pipes of the company in the streets of New York City?

Mr. **Page**: I object to that on the ground he has not laid the proper foundation to qualify this witness to give any such testimony.

Mr. **Burr**: Under the order which has been made here by Mr. Justice Lacombe, I notice that we are required to allow these witnesses to proceed without interruption. Does that mean that we are not to object or be permitted to object.

The **Master**: I don't remember any such provision, Mr. Burr.

Mr. **Burr**: It is very clearly stated in the order that these witnesses are to be permitted to testify without interruption.

The **Master**: I do not so construe it. You can object.

Mr. **Burr**: Well, I object on the ground it is apparent that this gentleman disavows any claim to be an expert on this particular matter of electrolysis and is not competent to testify in that regard.

The **Master**: I will let him answer.

Mr. Burr and Mr. Page except.

A. May I enlarge upon my statement as to qualifications, Mr. Master?

The **Master**: Yes.

Q. Yes.

A. I do not pretend to be an electrical expert: I do know about the effect of electrolysis and have suffered from it as a manager. I was one of the first to observe it in Atlanta, where the pipes were very severely injured, and the joints also. I experienced the 1939 same thing in Syracuse, and had electrical measurements made for me to satisfy myself that the trouble came from electrolysis. There is not the slightest question of course that electrolysis is to be found all over the United States, injuring the pipes of the gas companies and water companies. I have made myself familiar with it by study, but I repeat, I don't pretend to be an electrical expert in the sense that I am a gas expert but I believe myself entirely qualified to take the ground that electrolysis is a very grave danger, although I do not believe to-day that it has done any great harm to the New York pipes. It is simply a danger, that is my position.

Q. How would that danger be affected by the increase in subways and the electrical currents which follow from them and the general installation of electricity in traction which has taken place very recently in New York?

Mr. **Page**: Objected to as purely speculative.

Mr. **Master**: It seems to me that is a deduction anyone can draw, in view of the statement he has already made, is it not?

Mr. **Mathewson**: Perhaps it is, if the Master thinks so, I will not press it.

The **Master**: If a little electricity is bad, a great deal more will be worse, will it not?

Mr. **Page**: He says it has not been very bad in New York and it would be speculative as to what——

Mr. **Mathewson**: I will not press the question in view of the Master's suggestion.

The **Master**: You can press it and have the objection sustained and the question answered if you like.

Mr. **Mathewson**: No.

Q. Have you bought and sold gas plants, doctor?

A. I have—wait a minute, sold? Yes.

1940 Q. Have you appraised them for other people?

A. That has been probably 50 per cent. of my work since 1894.

Q. Have you appraised many in that way?

A. Yes sir, a good many. I appraised all the works with one or two exceptions that were taken in by the United Gas Improvement Company from the time I was general superintendent. The directors insisted upon a report from me before they entered into negotiations or before they concluded them.

Q. Do you know whether or not the fact that a business is established and that it has connections with consumers and is operating enters into the value of the business in appraisals or sales or purchasers?

Mr. **Page**: I object to that question on that ground that while such elements may enter into the appraisement for purchase or sale, those elements cannot properly enter into an appraisement for the purpose of establishing the price that the public should be charged for gas.

Mr. **Burr**: Same objection.

Mr. **Mathewson**: The cases as we understand them, and when we come to argue the law we will present them, hold that such an element must be taken into consideration in establishing the capital upon which the company is entitled to a return.

Objection overruled.

Mr. Page and Mr. Burr except.

A. Very laregly.

Q. Assuming, Doctor, that in 1884, six gas light corporations operating in the City of New York, were consolidated, forming the complainant company, the Consolidated Gas Company; that one of the constituent companies was incorporated in 1823, and was 1941 in operation from 1825 up to 1884; and that the other five were incorporated at intervals prior to the consolidation in 1884; that the output of the six companies in gas in 1885 was about 3,942,000,000 feet and that the output has increased until in 1905 it was 13,283,000,000 feet or thereabouts; that the population of

Manhattan Island, on which the Consolidated Gas Company is operating, is over 2,100,000 people; that it shows an increase of something like 50% in population in the last 30 years or so; that the Consolidated Gas Company has about 390,000 consumers, and is in active operation to-day, what would you consider to be the value of the good will of that business, including the value of the established business, and its connections with consumers and other elements which go to make up good will as distinguished from its tangible plant.

Mr. Burr: That is objected to as incompetent, irrelevant and immaterial.

Mr. Page: Objected to as incompetent, irrelevant and immaterial, and for the reason stated in the objection to the last question.

The Master: Any question of franchise against the public is not material?

Mr. Mathewson: I did not include that. The relations between the company and its consumers.

Objection overruled.

Mr. Page and Mr. Burr except.

A. I should estimate it at not less than $7,500,000.

Q. What rate of return in your judgment and experience is the company entitled to upon the amount of its investment in the gas busines-.

Mr. Page: Objected *on* on the ground that it is calling 1942 for this witness to usurp the functions of the court.

Mr. Mathewson: I do not think so.

The Master: Well, gentlemen, there may be a very serious question about that kind of evidence, but I see the affidavits presented to the court on the injunction proceedings cover that ground to some extent, and I am going to allow that evidence.

Objection overruled.

Mr. Page and Mr. Burr except.

Question repeated as follows: What rate of return in your judgment and experience, is the company entitled to upon the amount of its investment in the gas business? Companies of this character, located as this company is?

A. In my opinion, the question of return and rate of capitalization are interwoven. I think that the original investors up to the time the business is fairly well established are entitled to 10%, and the final average must be made up on the basis of what the new capital can be brought in at in view of the natural hazards, and as a rule you figure out that on capitalization of say 3 to 3.75, the company should be allowed a return of about 10%.

Mr. Page: To get it a little clearer, will you get him to state what the 3 to 3.75 is?

Q. What do you mean by 3 to 3.75?

A. I mean that the amount of capital on the thousand of annual sales, for instance $3.50 per thousand of annual sales.

Q. When you speak of the good will of this company, as in your

judgment worth $7,500,000 upon the basis which I have indicated, you mean the good will assuming that the company is en-
1943 titled to sell gas at that price, or to make that return?

A. That it is entitled to sell gas at $1.00, that it would be protected in its rights by the courts to sell gas at a dollar and to make a return of 30 cents a thousand to cover profit, and the burden of capital generally.

Q. Is 30 cents a thousand in your experience an excessive allowance for return on capital?

A. It is not, no.

Q. Have you from the figures presented in this hearing prepared a statement of what you consider should be charged to the operating cost of the production of gas in favor of the Consolidated Company?

A. I have.

Q. For the year 1905?

A. I have.

Q. Will you present it, please?

A. Am I at liberty to read it the way I have prepared it?

Q. Have you other copies of it?

A. I have.

Q. How many have you there?

A. Two more.

Mr. Mathewson: We will hand a copy to each of the counsel and they can follow it as you read and you can simply make the statement on the record as Mr. Addicks did. I think you might read it so the Master can hear the method followed by you.

A. I consider first the income, as follows:

Income & Cost per M. as of December 31, 1905.

By Exhibit No. 96:

Gas sales stated as $13,552,482.97; but this includes $565,241.39 for city lamps. The gas consumed in these lamps was taken for the purposes of the contract at an average hourly consumption of three c. f. = 270,779,678 c. f. @ 90¢ = $243,701.71, leaving for maintenance, $565,241.39 — $243,701.71 = $321,539.68. It
1944 is in evidence that an average of 3¾ c. f. was consumed per lamp hour bringing the consumption to 338,474,597 c. f., which at 90¢ would be $304,627.13, and leave for maintenance, including Welsbach mantles, renewals, etc., $260,614.26 against a cost of maintenance of $289,259.09—a loss of $28,644.83. The inclusion of only 270,779,678 c. f. as the amount consumed shows an apparent profit on maintenance of $32,280.59. As it would now greatly complicate the figures for cost per M. to correct for the facts as shown, this statement is made up on the basis of gas consumed at three feet per hour.

Gas sales — nominal — including lamp maintenance	$13,552,482.97	
Deduct amount nominally received for lamp maintenance	321,539.68	
Total Sales 13,283,163 M.......	$13,230,943.29	99.607

Receipts applicable to the gas business but not from sales of gas:

Maintenance of Gas Lamps		$321,539.68	2.4207
Miscellaneous Income:			
Stove rentals	$122,322.60		
Discounts	9,497.57		
Real estate rentals	37,408.88		
Sundries	3,481.48		
Dividend—National Coal & Coke Company	5,000.00		
		$177,710.53	1.3378
Total		$13,730,193.50	103.365
Cost & Reserve, as shown next sheet			70.947
Gross profit to cover all charges for capital			32.418

1945 By Exhibit No. 94:

Station Cost	$3,455,091.37		
Gas manufactured under agency agreements	997,039.89		¢ per M.
	$4,452,131.26 +	13,283,163	33.517
Distribution	1,641,092.19 +	"	12.355
General Expenses	2,871,263.53 +	"	21.616
	$8,964,486.98 +	"	67.488
Taxes included $965,843.88, of which $63,222.87, taxes of 3 per cent. on dividend in excess of 4 per cent. and one-half of 1 per cent. on gross receipts does not apply on gas business—$63,222.87			.476
			67.012

Now I proceed to deduct certain charges which appear in above amount, and I believe I do what all gas managers who have had experience do, that is, substitute average figures.

Deduct Charges for the year for which are to be substituted average figures as explained in note:

Repairs—Production or manufacturing .... $217,319.07 = 1.6360¢

I call attention to the fact that that appears in Exhibit 94, I think it is, as two hundred and ten thousand and odd dollars, but there was a small amount for repairs which is included in the pumping expense or distribution expense, which makes up this little difference of $6,000,

so I repeat the amount of repairs	$217,319.07	= 1.6360¢	
Distribution	474,750.91	= 3.574 ¢	
	$692,069.98	= 5.210 ¢	
Deduct Contingent Expense covering Depreciation and extraordinary hazards, etc., to be covered separately	1,328,316.37	= 10.000¢	15.210
Cost at burner exclusive of Repairs, Final Renewals (Depreciation) and contingencies including extraordinary hazards			51.802

1946 Repairs—Average actual expenditures from 1884 to Dec. 31, 1905:

Production (Manufacturing)	3.6412		
Distribution	3.9446		
		7.5858¢	
Final Renewals (Depreciation):			
Production (Manufacturing)	4.9795		
Distribution	1.5797		
		6.5592¢	14.145
Total for Repairs & Renewals		14.1450¢	
(Current and final):			
Cost at burner with no reserve as yet included to cover contingencies			65.947
Reserve, as explained in Note			5.000
Total Cost & Reserve			70.947

Notes.

Reserve:

If the selling price is to be fixed by law and so be beyond the control of the seller, the price should be sufficient to cover an averag cost of gas, including the maintenance of the investment at full valu and a fair return on the investment, having in view the hazards an chances of the business.

The cost cannot fairly be taken as of any one year even if repair are taken at the average expenditure for twenty years and the fina renewals (to cover depreciation) are estimated on the basis of (averaged) final renewal at end—say in this case—of forty years. Ther are many contingencies which might not be covered by the pa twenty years' experience, notably electrolysis and present apparent upward tendency of cost of materials and labor. In addition to this general upward tendency, there is the hazard of strikes at the works and at the coal mines, either liable to increase cost, London Companies have been allowed to cover strike expense, at least in part, 1947 from their so-called "Insurance Fund"—one of the Reserve funds. Fire might cripple the business and even if the works were covered by insurance, the losses beyond the physical destruction might be serious. Explosions are always liable to happen and they are much more liable to happen along the lines of mains since the general use of electricity has let loose stray currents in the streets. Damages to employees and others from accidents. Increased cost liable to be met by the extraordinary activity in turning over the streets in building subways and the like. Expenses through such investigations as the present—the third inside of two years. A very serious hazard is liable to develop from electrolysis. While there is no basis for estimate—for then it could be, as it should, include in the Estimate of Depreciation or Renewals—it is known to all gas and water engineers that this is a present danger. While no man can estimate the loss liable to occur, no man informed on the subject can affirm that even in Manhattan Island this source of loss is not liable to develop.

In view of the facts thus briefly outlined, the company should be allowed to accumulate a reserve until the fund reaches, say, one-tenth of the investment, as in the case of many British companies, and the company further should be allowed to renew this fund if it should be depleted, as in the case of the British companies and recommended by the New York Senate Committee of 1886.

Repairs & Renewals (Depreciation):

There is included for repairs the averaged actual expenditures for 20 years	7.5858
and for depreciation, that is, current and final renewals	6.5592
	14.15c. per M.

1948 The actual expenditures for repairs and renewals for the period from 1884 to December 31, 1905, have been 10.60c. per M. The amount shown in the Gas Commission hearing for a somewhat different period was 10.89c. The amount then added in this statement to cover *final* renewals is only 14.15—10.60 = 3.55c.

In this connection it is to be borne in mind that repairs and depreciation (or renewals) are interwoven and should be considered together. The total cost per M. of 14.15 for maintenance—current and final—is not excessive, as can be shown by comparison with other metropolitan companies.

Stove Rentals:

While stove rentals are included as an item of income per M. sold to offset charges now applicable against that item of additional income, it is to be noted that if the rental system should be abolished for any reason, the expenses now appearing against that item might very probably continue as an expense and thus represent additional cost per M.

Now shall I go into any explanation of how I got at my depreciation item, or leave that? I can give it in just a moment, the idea of it.

Q. If you think it is essential to an understanding of the situation you may give it.

A. I take the depreciable value of the property, and in my experience as a gas engineer I don't take any fixed per cent. from the text books and authorities, but I take my own judgment as to what should be the life taken for the final renewal of the plant. In estimating that final renewal—for instance, take rather a glaring case: I would not state as has been sometimes stated that I have, that a cast iron main only lasts fifty years or forty years or what-not, but in forming my estimate of the life of the plant I take into account that very likely anyone particular piece of good cast 1949 iron pipe if laid in the street in fairly good soil, not interfered with, and left there undisturbed might last for a hundred or one hundred and fifty years. I have seen it at the end of fifty years perfectly good, if undisturbed. My estimate therefore is not made up on the exhaustion of the plant by actual rust or by anything of that kind, but what I believe, all things considered, the life of the plant, when the plant will have to be renewed by reason of exhaustion of life. In this case I have taken what figures out to be almost exactly forty years and I take 2½ per cent. therefrom as the right amount for forty years, and I take 2½ per cent. on the depreciable property, and having found the amount I divide it by the amount of sales and show a cost per thousand as we have in this statement.

I would like to say one word as to why I take 2½ per cent. instead of going to my interest tables and arriving at a theoretical amount of 1.05 per cent. for forty years; 1.05 put away in a depreciation fund to accumulate at 4 per cent. If that was put away in a depreciation fund the company would be deprived of its use. I prefer to consider the case exactly as we do in the gas business. We do not put that money away in a depreciation fund except in very rare cases, but we put it back into our business and use it in lieu of bringing in to that extent additional capital for extension of business. The theory on which I work is based upon the fact that that money, that depreciation fund, reinvested, if the business is prosperous, will at least return us 4 per cent. and therefore the additional returns from the depreciation amounts as expended will pay for the difference between the 2.5 and the 1.05. In other words, the load upon the business is the same. In one case you would have a less amount charged for depreciation and a greater 1950 load of capital and in the other case you have it all centered upon the load of depreciation.

Q. I see, Doctor, that Mr. Addicks in his estimate has an estimate to increase the quantity of oil or the price of oil and figures it out to 1.83 cents, and also averages the price of labor and finds that

.78 of one cent should be added for that and perhaps one or two other items of that kind. Those as I understand are all included in your 5-cent contingent item?

A. Yes, they must be, because I haven't any such items.

Q. Well, it is intended to cover those things without specifying them?

A. That is just what my five cents is to cover, those fluctuations.

Mr. MATHEWSON: That is all.

At 5.25 P. M. adjourned to September 11, 1906, at 11 A. M.

Last Exhibits:

Complainant's 234.
State's U.
City's 45.

1951 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, TUESDAY, *September* 11*th*, 1906—11 a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Kirby, Mr. Burr.

1952 Mr. MATHEWSON: I have one or two additional questions to ask Mr. Humphrey on direct-examination.

ALEXANDER C. HUMPHREYS resumed.

Direct examination by Mr. MATHEWSON, continued:

Q. Are you familiar, Doctor, with the value of mains and services based on the cost of installation?

A. I am.

Q. Did you read the testimony of Mr. Simpson in reference to the 822 miles of mains, regarding which he testified as to the value of reproduction?

A. I did.

Q. Assuming that the Consolidated Gas Company has 822 miles of mains distributed in the sizes and mileage specified by Mr. Simpson, what in your judgment would be the present value, based on the cost of reproduction, of the mains to-day in the streets of New York?

A. The figure, if I recollect, that he gave was something over $12,000,000, and I satisfied myself that that was a very reasonable figure.

Q. Did you yourself go over the computation so that you are able to state from your own experience?

A. Yes, sir.

Q. Mr. Simpson also testified that the value of the services, based on the cost of reproduction, at present was about $1,994,000. Did you examine the question of the value of services?

A. I did.

Q. What is your conclusion on that?

A. That was also a reasonable estimate.

Q. Do you believe they could be reproduced for less than those figures?

A. I do not.

Q. The same as to mains?

A. The same as to mains.

1953 Q. What do you understand by the term "service mains" as used in the two Acts establishing pressure, to which I called your attention yesterday?

A. Never having heard the term used before in the gas business, of thirty years' experience and more, I had to evolve a meaning for myself, and I presume that it must mean the distributing mains, as differentiated from any higher pressure mains, pumping mains, and the like, which are not connected to the consumer's. And in this I was simply confirming that interpretation given to the term by the commissioners at the end of their order in regard to the Consolidated Company, in which they referred to the pressure law and say that—I don't know the exact terms—say that in so much as the law passed confines the company to distributing gas to the city lamps within the limits of one inch and two and one-half inches, and in so much as the gas has to be conveyed to the private consumers through the same service mains as the gas to the public lamps, of course the law will have to apply also to the gas distributed to the private consumers, and as you cannot convey the gas to the private consumers through a service pipe which goes in the city lamp, of course it must mean the distributing mains.

Q. Is it, in your judgment, possible to construe the mains as meaning the services?

Mr. Page: Objected to. The doctor may be able to construe certain things but he cannot say what it is impossible for the Court to construe.

Question withdrawn.

Q. I ask you whether in your judgment the term mains, whether taken alone or preceded by the adjective "service," could be properly applied to the service pipes running from a main to a house?

A. Not possible, according to the practice of the gas business. They are two distinct things, differentiated widely from the 1954 other; one is the main and the other the service from the main.

Mr. **Mathewson**: That is all. Now, if the Master please, I would like to call Mr. Halsey, who is temporarily in town.

N. **Wetmore Halsey**, a witness called on behalf of complainant, being duly sworn, testified as follows:

Direct-examination by Mr. **Mathewson**:

Q. Where do you reside.
A. I reside in South Orange, New Jersey.
Q. Where are you in business?
A. 49 Wall Street, New York; and also have offices in Chicago and San Francisco.
Q. Are you a member of any firm?
A. Yes, sir; N. W. Halsey & Company.
Q. What is the business of that firm and of yourself as a member?
A. Dealing in investment securities; principally bonds.
Q. How long have you been in that business?
A. Over 20 years.
Q. Have you during that period ever purchased or sold utility properties, gas properties?
A. Yes, sir.
Q. Do you know the return which you expect to be able to get upon an investment in gas properties in the case of your purchases?

Mr. **Page**: Objected to as immaterial, irrelevant and entirely speculative.
Mr. **Burr**: I make the same objection.
The **Master**: I will take it.
Mr. Page and Mr. Burr except.

A. Yes.

1955 Q. According to your own experience and such information as you have acquired in the banking business, what rate of return does the investor require on the investment in the purchase of a gas business?

Mr. **Page**: Same objection.
Mr. **Burr**: Same objection.
Same ruling. Both except.

A That is the first thing we look to, of course, as to what the return will be, and we expect to get a return at once, or within a very reasonable time, of at least 10 per cent.
Q. Ten per cent. upon what?
A. Ten per cent. upon the value of the property?
Q. Would it in your judgment be possible to interest capital in the acquisition of a public utility enterprise of the character of gas companies upon a less expectation of earning than 10 per cent.?

Mr. **Page**: Same objection.
Mr. **Burr**: Same objection.
Same ruling: Both except.

A. I think not, sir.

Q. Is that your exeprience?

A. That is my experience.

Mr. Mathewson: That is all.

Cross-examination by Mr. Page:

Q. You say that the rate of the return is 10 per cent. upon the value of the property. Has that any relation to the stock? Do you mean a 10 per cent. dividend on the stock?

A. I was not regarding securities. I was regarding the value of the property; what had to be paid for the property regardless of what securities might be issued to represent that investment.

Q. Well I understand then that you have been engaged in buying and selling gas works?

A. Why, I have done some of that, I don't know how
1956 many, but eight or ten gas plants I have bought. My business is more the handling of the bonds and my original interest in a property was to get a good safe issue of bonds and doing that I have sometimes thought that it was advantageous and have interested people in the entire property and reorganizing it; sometimes putting the properties together, consolidating a number of properties.

Q. I want to understand it. You say you bought and sold securities and the holder of those securities would expect to realize 10 per cent.?

A. I said if I were making an investment in a property, that I would expect on the investment from the amount of money and the value of the property, a return of at least 10 per cent. Some of them might be represented by securities with a fixed value, a fixed annual income say of five per cent., and others might be a stock representing ownership, and they are an entirely different class of investors that buy the stock than those who buy the bonds.

Q. You would expect then that a bond issued by a public utility corporation paying five per cent. interest would sell at 50.

A. Oh, no, I didn't say that at all. That is not a fair construction of what I said.

Q. How else could you get a 10 per cent. return on a five per cent. bond?

A. Did I say what amount of bonds I would issue?

Q. No, you said you would get 10 per cent. returns.

A. Yes, on the investment. To give you a concrete example, if you wish it——

Q. Wait a minute. You deal in investment securities, you have got bonds of a gas company that you want to sell, those bonds draw 5 per cent. Now, would you expect to give the investor those bonds at such a rate that he could expect to realize 10 per cent.?

A. No, sir, I said nothing of the kind.

Q. Now, in regard to stock, the stock of these public utility corporations: a stock that pays 5 per cent., would you expect
1957 that to sell at 50?

A. It depends entirely upon the conditions, but I should think that a stock that paid 5 per cent. and was certain to continue to pay 5 per cent. would sell very much better than that; sell close to par.

Q. It would probably sell at 102 or 104?

A. It might; it might sell at 75, depending on all the conditions, franchise and the location, permanency of the business; all of those things enter into it.

Q. Isn't it a matter of fact that stocks and bonds are sold at about a 4 per cent. basis—that is, on a stock or a bond that brings a certain return the investor is willing to take 4 per cent?

A. No; you can buy a great many securities to-day on an eight or a ten per cent. basis if you wish to.

Q. But I mean securities that have paid their dividends for the last twenty years, where the company has a monopoly of the business and has paid its dividends regularly, isn't it your experience that those securities sell at about a four per cent. basis?

A. Well, as I say, you must take into consideration all of those things that go to make up the value of the securities, the permanency of the business, its franchise, situation, how much that monopoly, as you term it, is to be depended upon, how much it is subject to regulation and the permanence of the locality—all of those things must enter into it. For instance, the Chicago properties, for an illustration, the stock there has been selling around 90 to 95, yet it shows very good earnings.

Q. Have you dealt in Consolidated Gas Stock?

A. I don't deal in stocks at all. That is not my business.

Q. Are you informed at all as to the rate at which that stock has been selling and the rate of dividend it has been paying?

A. Yes, from the public quotations. That is all. I have never dealt in it. Never dealt in a share of it.

Q. Do you know while paying eight per cent. dividends it sold in the neighborhood of 200 or over?

A. Yes.

1958 Q. And to-day, while it pays a four per cent. dividend, it is selling at 140?

A. Yes.

Mr. Burr: No questions.

Redirect-examination by Mr. Mathewson:

Q. When you speak of ten per cent. earnings upon the value of the property, do you intend to indicate how much of that would be distributed to bonds and how much to stock?

A. Not at all. I make an original investment.

Q. Or whether the stockholders shall keep a part of the ten per cent. and put it into extensions of the property and pay themselves only a part?

A. No, sir.

Q. Do these considerations, to which your attention has been called by Senator Page, change your view at all as to the earning power of a property based upon its value?

A. Not in the least. The price at which stock may sell may depend on manipulations or rumors that are gotten out. What it may sell at or be quoted at does not count.

Q. You know the stock of the Consolidated Gas Company carries with it the ownership of practically all the stock of the New York Edison Company, an electric company, do you not?

A. Yes.

Q. And would the future value of the property be reflected in the price of Consolidated Gas Stock?

A. Certainly it would.

Q. And might not expectations as to the future earnings have much to do with the present quotation of the stock and bonds?

A. It has a great deal to do with the stock.

Q. Isn't it a fact that the quotations of stock, as a rule, discount the future in that way?

A. It presents an entirely different investment from an entirely different point of view, than the man who invests in the bonds.

Mr. MATHEWSON: That is all.

Mr. PAGE: That is all.

1959 WILLIAM H. BRADLEY, recalled and further examined, testified as follows:

Redirect examination by Mr. MATHEWSON:

Q. In your absence Mr. Addicks presented figures in some detail showing the amount of $13,134,519.65 as the estimated cost of the first Astoria unit, including land and tunnels. Were those figures made up by you?

A. Yes.

Q. And is that the correct estimate as presented here?

A. $13,134,519.65.

Q. He also specified certain other items amounting to between $2,000,000 and $2,500,000, which he said represented items some or all of which might be added to the first unit for its completion?

A. That is correct.

Q. And are those estimates also yours?

A. Yes.

Q. Are they — best estimates you were able to form?

A. The best estimates I could give at the present time.

Q. You testified from memory to Senator Page that, taking the total at about $13,096,000, and deducting the value of the land and tunnel, it would leave a balance of $9,217,000. The exact figure is what?

A. $9,351,961.37. The estimate including the tunnel is $12,001,961.37.

Q. If you deduct from the $13,134,519.65 the land and tunnel, what is the remainder?

A. $9,351,961.37.

Q. Which of those items included in the $2,582,500 will it be in your judgment essential to construct in connection with the first unit?

A. It will be absolutely essential to include practically one-half of the amount. The others may or may not be included, as matters develop during construction. Do you want me to go on with the items?

Q. Yes.

1960 A. Coal storage bridge, $150,000; foundations $80,000;
rope haulage system, $45,000; coke storage plant, $50,000; scows and tugs, for transportation to the coke unloading and discharging stations, $500,000; stables, horses, harness and wagons, $10,000; those I consider to be essential to the construction of the first plant; grading and filling I should put in there also, $50,000; the balance, by-product plant, switch yard, dwellings for company's employees, and the steel works for the second 15,000,000 foot holder, as I say, as the work develops and construction goes on, we may find it necessary to put it up, but I hope not.

Q. You have but a single holder there now?

A. There is but one holder there now.

Q. Would you consider it safe to operate without a reserve holder?

A. It is not considered absolutely safe to do so. Many plants are worked with one holder, but holders are liable to accident, and with an accident the whole plant is stopped.

Q. It appears that two tanks are included in the $13,134,519.65. It is necessary to construct the two tanks at the same time?

A. Yes.

Q. From an engineering standpoint?

A. From an engineering standpoint. The second is pretty closely alongside of the other one, and I never like to excavate closely alongside of a very large tank filled with water for fear of breakage, bursting it.

Q. Referring to the manufacturing capacity of the plant, do you consider it safe to operate a plant without a substantial margin over for reserve?

A. Of course not, no, sir. You simply cannot do it. I do not think it is safe to operate gas plants for lighting a large city like New York with less than 20 per cent. reserve.

Q. Of your manufacturing capacity?

A. 20 per cent. reserve of the manufacturing capacity.

Q. Do you have the supervision of the expenditures in the
1961 engineering department for material, labor, &c., generally
speaking?

A. Oh, yes, in all cases.

Q. Do you employ any men in the engineering department who are not required by the needs of the business?

A. Not if I know it.

Q. You would be likely to know it, would you not?

A. Yes.

Q. And how about the compensation that they receive? Do you pay the market rate or more or less?

A. They are paid the market rate; a great many of them think they are not paid enough.

Q. Do you pay any more than you find it necessary to pay to procure the required labor?

A. No, sir, I look into that very carefully. The first of last July my assistant recommended a lot of increases to our various men, but I said no, I would not grant it.

Q. Are there any expenditures that you deem unreasonable in your department?

A. No, sir.

Q. Mr. Bradley, it has been shown in evidence that by the reports of the company filed with the local tax assessors or with the State Board of Tax Assessors, the plant and real estate of the company had been inserted at something like $19,000,000 for several years past, which it is testified is made up of the land or real estate at the book value, and the figure for the plant of the company, amounting in 1904 to $8,456,595.71, whereas the book was $15,775,462.88, or nearly twice as much. Do you remember any conversation with Mr. Carter in the year 1902 in reference to the basis of placing the value of the plant for the purposes of the tax report?

A. Mr. Carter applied to me for a figure, and I took advice with our general counsel on the subject and was informed as to what the law was in the case. Acting upon that advice I simply cut the book
value in half and added to that—the absolute figure I can-
1962 not give you; I have not got them—but I added to that, if
my recollection serves me, between $600,000 and $700,000
as the scrap value of the plants to be dismantled, understanding that we were going on with our Astoria business and that within a very short time practically the works would be dismantled and simply scrapped, as we had no market for them. The resulting figure from that, half of the book value and the six or seven hundred thousand dollars that I added, was the figure that Mr. Carter used in the tax report.

Q. You went into no detailed computation at that time, did you?

A. I went into no detailed valuation, because I assumed that the book value was very nearly if not practically correct.

Q. Then, if I understand correctly, you assumed that one-half of the plant would remain in New York indefinitely and you took that at its full value?

A. That it would remain in New York long enough to be subject to the payment of taxes; the other half would be simply thrown away.

Q. And you took the scrap value of the other half, which amounted to a few hundred thousand dollars, did you?

Mr. Burr: I object to this method of cross-examining this witness. That is leading and suggestive, and it is unnecessary to put all this into his mouth.

The Master: Do not lead him.

A. I testified to the same thing before the Gas Commission. The testimony is there.

Q. Did the scrap value plus the one-half of the plant at full value equal the figure that you gave Mr. Carter at that time?

A. It did.

Q. Do you remember what the advice of counsel was as to the value that was to be used?

A. The advice *to* counsel was to me, or the statement that 1963 counsel made to me, was that the assessors were instructed that a manufacturing plant—wait a minute, I want to get that straight—that the value of a plant was the value of the land; that there was nothing to be added to the value of the land except such improvements as were made valuable to the land. If the plant added no value to the land, if it was a detriment to the land, it was not to be assessed.

Q. Was it to be assessed at anything more than what it would sell for beyond the value of the land, in case of sale?

A. That is it; that is what I intended to say.

Q. What has been your experience as to the amount at which a gas plant will sell for when it is necessary to sell it?

A. I have had some little experience right here in New York with that. Shall I give it?

Q. Yes.

A. For instance, the 3,000,000 holder at the 18th Street station, that cost the company nearly $400,000, was sold by the city, when it was taken, for about $9,000. I was present at the sale; I was there and heard it, and I know that to be a fact.

Q. Do you know what the 111th Street plant brought when it was sold?

A. The 111th Street plant as an entirety brought between $5,000 and $6,000 at public sale. I was also there at that sale.

Q. That was a plant that cost a considerable sum in addition to that?

A. A plant that was as large in capacity as some of them in the city to-day. The 18th Street, to go further, the 18th Street plant was sold by the city, the portion taken, of a value of about a million dollars, sold for something about $6,000. That was sold at public auction. I was also there at that sale.

Q. And was not a great part of the 111th Street plant that was so sold practically new?

A. It has only been operated some four or five years.

1964 Q. You were not asked any questions on this subject before the Stevens Committee, were you?

A. I do not recall that I was; no, sir.

Q. Did you state these same facts before the Gas Commission?

A. I did as far as I was asked; I do not think I went into it to the extent that I have now, but some questions were asked me that I answered.

Q. Let me ask you whether the figures that you gave Mr. Carter, and which, with slight adjustments which he has testified to, amounted to $8,456,595.71 in 1904, as shown in Exhibit No. 223, represented the structural value of the plant as an operating concern?

A. Not at all.

Q. Or the original cost of construction or cost of reproduction?

A. No bearing whatever on that.

Q. You have testified that you have had experience in the construction of gas plants and parts of gas plants, since you have been in the gas business, and as an engineer you have superintended other constructions, have you?

A. Yes, sir.

Q. Did you make an estimate of the value of the plants of the Consolidated Gas Company to-day on the basis of the cost of reproducing them?

A. I have made a general estimate; yes, not detailed.

Q. As accurately as you could from a general estimate, and your knowledge of the gas business?

A. Exactly; as accurate as I could.

Q. Will you state what that estimate is?

A. At the time, if I recall the figures correctly, $18,321,000.

Q. That is the cost of reproduction, with allowing for depreciation, is it?

A. Yes, sir.

Q. And what does that include?

A. It includes apparatus, buildings and gas holders.

Q. Not mains and services, or anything like that?

A. No, sir, not mains or services or land.

1965 Q. Is that your present estimate also?

A. I see no reason to change it.

Mr. **Mathewson**: That is all. There is no other witness here. I would like to have them cross-examine Mr. Bradley, if they could go on with him. I do not want to get him down here oftener than I have to. I shall have one or two other witnesses for very brief examination, but I cannot get them here before to-morrow morning. I was not prepared to go on. They were out of town, and I was unable to reach them; some of them, at any rate. There may be one in town, but I was not able to see him this morning. I shall not take with them over thirty minutes all told, I think; certainly not over an hour, and I ask permission to produce them to-morrow morning.

The **Master**: You have no other witness here to-day?

Mr. **Mathewson**: No, I have witnesses here for cross-examination, Mr. Simpson, Mr. Humphreys and Mr. Carter, if he is desired.

The **Master**: You have other witnesses on the direct?

Mr. **Mathewson**: I shall have only two witnesses, and they will only take about the same length of time as Mr. Halsey.

The **Master**: Are they along the same general lines?

Mr. **Mathewson**: Yes.

The **Master**: Under the circumstances there is nothing for us to do but to go on without losing any time, and cross-examine the first witness there is, Mr. Bradley.

Mr. **Page**: If the Master assumes the responsibility.

1966 The **Master**: I do not want to assume the responsibility of either closing Mr. Mathewson's case or wasting the day, so I do the next best thing.

Mr. **Mathewson**: I said that I would only take a day and a half, but I have only taken about two hours or two hours and a half, and I think another hour will do the whole business, that is, on my direct.

Recross-examination by Mr. PAGE:

Q. Have you produced a detailed statement of the plant at Astoria which I requested last July should be prepared?

A. The items for which you made out a list?

Q. Yes.

A. Is that it, Mr. Mathewson? (Hands paper to counsel.)

Mr. MATHEWSON: This is what you requested. This is the best they could do. That will perhaps meet your requirements, Senator.

Q. Is the horizontal retort house east or west, the easterly inclined house? I notice that you refer to an east holder, and an east condenser and an east purifier house. The horizontal retort house is one that would be required at the east unit?

A. Well, it is all one unit.

Q. I understand, but I mean by that, it is connected with the east condenser house and the east purifier house?

A. They are all connected together. The reason for making the east and west house is because the houses would be too large; they are simply a duplication, not making the buildings too large or the apparatus too cumbersome in one place.

Q. If we take the east retort house, the east condenser house and the east purifier house, and the east tar extractor and washer house, we would have apparatus that would be capable of handling
1967 ten million cubic feet of gas per 24 hours?

A. Not entirely; the boiler house is common to all; so is the meter house.

Q. No, but I said we would have apparatus.

A. Yes, the apparatus contained in those buildings is capable of handling that. Other buildings would have to go in to make the unit complete.

Q. The horizontal retort house or the east retort house is not yet completed, the building itself, is it?

A. Not entirely. There is a lot of finishing work to be done, small work, small pipes and small construction of all sorts.

Q. And you estimate that the building itself will cost $302,304.03?

A. That is correct, sir.

Q. That building contains 60 benches of 8 retorts each, retorts 16 by 26 by 21 feet 9 inches; those are through retorts, are they?

A. Through retorts.

Q. And the capacity of that house is 10,000,000 per 24 hours?

A. Rated at ten million.

Q. And that has in it all the coal and coke handling apparatus, charging and discharging machinery and everything else that is necessary to a complete retort house of that capacity?

A. It will have on completion.

Q. And the estimated cost includes that as a complete operating retort house?

A. Yes, sir.

Q. And the estimated total for that is $933,291.09?

A. For the apparatus.

Q. For the apparatus?

A. For the apparatus, excluding the building.

Mr. PAGE: We have had the building before; that is about $302,000.

Q. The east purifier house will cost, when completed, $159,430.48, is that right.

A. $159,430.48.

Q. The purifying apparatus complete, piping and everything, would be $200,142.80?

A. Correct.

1968 Q. And that is sufficient purifying capacity to handle the 10,000,000 cubic feet of gas per day?

A. Easily.

Q. The east condenser house will cost $25,960.03 completed?

A. Correct.

Q. And the condensers and rotary scrubbers in that building, $83,405.72?

A. That is right.

Q. And that is sufficient capacity to handle the ten million cubic feet of gas daily?

A. Yes, sir.

Q. What is this tar extractor and washer house?

A. That is part of the apparatus for the manufacturing. The tar extractors, as their name implies, take the tar out of the gas.

Q. This is some improved method, is it?

A. Improved method of tar extracting.

Q. That is something that you do not have in your plants in Manhattan, is it not?

A. We haven't any of this improved type.

Q. You extract your tar in the condensers, don't you?

A. In the condensers.

Q. And the hydraulic main.

A. And the hydraulic main, which is something we do now. This is a further treatment.

Q. This is for additional purification of the gas and also to recover more residuals?

A. Yes, sir.

Q. And that will cost $41,965.24, the building?

A. Right, sir.

Q. And in this you also have a cyanogen washer, I see, besides tar extractors?

A. The naphthaline and cyanogen washers are also in that same house.

Q. And the contents of that building are worth $124,617.79 complete?

A. Correct. I will say right now, Senator, that there may be some little variation from these figures when the thing is absolutely complete. As you see at the head of this column, it is an estimate to complete.

Q. I think it is safe, however, for us to assume that the
1969 estimate is large enough to cover any contingency.

A. It is intended to be, but may not be.

By Mr. MATHEWSON:

Q. Does that estimate cover the 10 per cent. undistributed expense for the Consolidated Company?

A. No.

Q. Or any interest?

A. No, sir.

By Mr. PAGE:

Q. The east holder is the one now completed, or substantially so, is it not?

A. No, sir.

Q. Well, it is——

A. That is the one that is not completed. The west holder is substantially completed. That is, the west holder tank is now completed; the holder itself is now being put in.

Q. Then to take a holder of fifteen million cubic feet capacity per day we would have to take the value of the west holder?

A. Yes, if you want to get a line right through.

Q. Yes. If you were building a works of only ten million cubic feet capacity a day, you would not build a holder of fifteen million cubic feet capacity, would you?

A. I would, if my company would allow me to; if they wanted to spend the money.

Q. It is considered sufficient holder capacity for a plant, is it not, if you have a total capacity equal to twenty-four hours' output of the plant?

A. Yes, but a 10,000,000 capacity plant might on an emergency send out a good deal more than 10,000,000 feet.

Q. Certainly.

A. And the send-out, as I use the term send-out—you say output—the output of a 10,000,000 capacity plant might be largely in excess of 10,000,000 feet in a great many cases, and is often.

Q. Well, do you mean by that that you would draw on 1970 the storage capacity of your tank?

A. Yes, sir.

Q. In excess——

A. In excess of the quantity made in any given twenty-four hours.

Q. But in computing the holding capacity of a company, all the holders that it has should be taken into consideration, those at the works and also those distributed around in different parts of the city?

A. If they are available for the storage capacity, yes.

Q. And it is considered good gas engineering, is it not, to have sufficient holder capacity for twenty-four hours' production of the plant?

A. No, sir; for twenty-four hours' output.

Q. Well, for twenty-four hours' output of the plant. How much is this horizontal retort house capable of producing and passing into the holder per day?

A. It is rated at 10,000,000 feet, but I cannot sit here and speculate on what it may produce, whether it will be one million more or less.

Q. You testified that it was considered good gas engineering to have a 20 per cent. reserve?

A. Yes.

Q. Now, have you a 20 per cent. reserve here, so that this plant could produce 20 per cent. more than 10,000,000 cubic feet?

A. No, sir; I should not run the house up to within 20 per cent., and then consider that I had the 20 per cent. left after that.

Q. Do you mean that you would only run this up to 8,000,000 cubic feet?

A. That would be the safe way. If after the 15th day of December or previous to the 15th day of January, if there was a demand for gas that made it necessary to go beyond that, I should do it, but I am speaking now of a general principle, not what might be done in one day or one week, but on a general principle I want 20 per cent. reserve. I can use that 20 per cent. reserve perhaps on
1971 an emergency, but not for a general thing.

Q. If you have several plants would you have a 20 per cent. reserve of production in each plant?

A. I would try to.

Q. Then, would you have, having an output of thirteen billion cubic feet in a year, would you divide that by 200, making 65,000,000, and also have a 20 per cent. reserve on the 65,000,000?

A. Yes.

Q. Then you would also have a reserve over and above the 65,000,000 of 13,000,000?

A. Let me make an explanation right there. I don't think you have grasped the situation.

Q. Very likely not.

A. We must have plant sufficient and with an effort to preserve the 20 per cent. reserve for the maximum days of the winter. We cannot put in a plant for the winter and take it out for the summer. We have to have it and keep it, and get it into shape for use. When I speak of the maximum capacity of the works I am speaking of the winter, not for the summer months, when we are down to perhaps one-half the capacity of the plant. But that plant must be there, whether it is 200 days or 365 days; that plant must be there.

Q. Then you don't have a 20 per cent. reserve over and above the maximum capacity of the plant?

A. The reason we divide by 200 is not to get the capacity of the plant at all; it is simply to get what amount the output of gas or manufacture of gas will be for the entire year, and it is 40 or 50 per cent. more in the winter than it is in the summer, but that 200 division is the correction to average the whole thing through the year simply, and has nothing to do with the capacity of the plant.

Q. I asked you whether it was 20 per cent. reserve? Whether the reserve should be 20 per cent. more than the maximum?

1972 A. 20 per cent. should be the reserve more than the maximum make in any one day.

Q. This holder, when completed, you estimate will cost $919,800, do you? I have taken the west holder as being the one completed.

A. That is correct. Yes, sir, that is the west holder.

Q. Now the exhauster house, as I understand it, is sufficiently large to handle 20,000,000 cubic feet per day instead of 10,000,000?

A. That is its design.

Q. Would a 10,000,000 capacity exhauster house cost more than half as much as this?

A. It would.

Q. What would you estimate that a 10,000,000 daily capacity exhauster house would cost?

A. Do you mean the house or the entire house and contents?

Q. Well, you can give it either way, the house separately or the house and contents, which would be the easier?

A. The house and contents that I have here cost $66,209.45.

Q. How much?

A. $66,209.45.

Q. Well, that is what this one cost?

A. That is what I say, that this one cost. I should say that an exhauster house would cost $40,000.

Q. That is, with contents complete?

A. Contents and house.

By Mr. Mathewson:

Q. To take care of how much?

A. 10,000,000 feet per day.

By Mr. Page:

Q. What unit did you use to multiply and produce that result, Mr. Bradley?

A. I added approximately, as near as I could tell, the cost of an extra machine. In this exhauster house that we have provided now there is an extra exhauster to be used in case of a break-down on any one of the five. That would have to be provided in a single house as well and would cost just as much.

Q. You have five exhausters and compressors in this house?

1973 A. Five exhausters and two compressors.

Q. And of that one exhauster is for emergency?

A. For emergency or a break down, or whenever they have to be shut down to pack the valves.

Q. So in a 10,000,000 capacity house, you figure it would be necessary to have 3 of those exhausters?

A. Three.

Q. Now we will take the meter house. Will you make the same computation there, this being a meter house to handle 20,000,000 daily capacity, and state how much it would be for a meter house of ten million.

A. The meter house I should simply divide by two.

Q. Then you should say the meter house would be $11,861.99?

A. What are you reading from?

Q. The meter house, the house itself. Do you mean to take the whole thing?

A. I was taking the whole thing.

Q. Well, we will do that.

A. $32,179.30 I make it without the odd cents.

Q. Now we will have a boiler house, I suppose, in this plant. How would you treat that to reduce it to ten million?

A. I should divide that and add to that the value of the chimney.

Q. The boiler house, then, with contents would be $29,944.48?

A. $34,866.01 for the total.

Q. Adding the chimney?

A. Yes. A single house has to have a chimney the same as a double house.

Q. Well, it would be the same size chimney?

A. Practically the same size. There would not be difference enough to count.

Q. Now we have the tar tanks and ammonia tanks yet to put into our plant. How much would you add for those?

A. The underground tar tanks are $10,245.73.

1974 Q. Would you need as large tar tanks for ten million feet as you would for twenty million?

A. Well, not as a rule, no. We always make our tar tanks as large as we can. I should say for a single unit that our tar tanks should be $12,000, in place of the $10,245.

Q. That is, it would be more.

A. It would be more than half.

Q. Well——

A. Excuse me, I should have said $7,000. I was adding two thousand dollars and I added ten thousand instead of five.

Q. Seven thousand dollars and how much?

A. About $7,000, I would put that in at.

Q. And the ammonia tanks?

A. The ammonia tanks I should put in at $20,000.

Q. What else is there that would be necessary for completing the apparatus that we have not already taken into consideration?

A. There are the general connections on the last page.

Q. How much would that be for a ten million plant? Half of what you have here?

A. Well, yes, half. This is an approximation, you understand. I will not be bound by the figures because it is not a fair line of picking the thing out.

Q. What is there unfair about it? We want to be fair.

A. Because it is simply impossible for me to sit here in a general way and say what proportion of that $87,000 is due to the west house or to the east house. I simply cannot do it without going back to my drawings and estimates and finding out just how much there is.

Q. Well, if you are piping a plant of two separate divisions it would only take half as much pipe, would it not, to pipe one of those?

A. Theoretically, yes; practically, it might be altogether different.

Q. What else is there?

A. Electric power house.

Q. Well, for a 10,000,000 capacity electric power house?

1975 A. And going on the same line, it should be half of $154,000.

Q. That is $77,000?

A. $77,000.

Q. What else would you add?

A. That is true of all the remaining items, tools and implements, horses, office furniture and fixtures, boats and scows, and permanent fresh water system.

Q. That should all be divided?

A. That should all be divided, if you want to go on in this way.

Q. I hate to abandon the road just as we have reached the end of it.

A. All right, I will go with you to the end, but if we do, we will run up against a stone wall.

Q. Then I will stop.

A. Will I take all these in a lump in the end, Senator?

Q. Yes, if you would. It is $130,706.64, isn't it?

A. That is right. That is $65,353.32, half of that.

Q. The total of these items that we have gone over that enter into the construction of a plant to produce ten million feet of gas daily is $3,110,021.93. Would you accept that, or would you want to verify that?

A. No, sir. There is an aggregation of items that were not called off by you on that paper there amounting to over a million dollars.

Q. Well, what are those?

Mr. **Mathewson**: It is perfectly apparent what they are. He has stated fully, and he has also stated that he would not give that as an estimate.

A. I stated definitely a few moments ago I would not stand by these figures, because I do not think it is a proper or fair way to get them out.

Q. Well, for the principal things that I have mentioned in the examination, that would be a proper cost value, wouldn't it?

1976 A. It would be an approximate cost value. As an engineer, I would not stake my reputation on an estimate of that kind.

Q. No, but supposing——

A. And I would not ask anybody else to use it.

Q. But supposing I am willing to risk my reputation, and we will take these particular items, my question was whether they did not total up $3,110,021.93?

A. That is the figure you have there, yes; but on my reputation as an engineer, not yours, but mine, I would not accept it. If I had known, Senator, that you wanted to get this thing out, I would have undertaken to do it, but I really do not think it is a fair way to get at it.

Q. Wherein is there any unfairness in any of the figures you have given?

A. Simply because they are guesses to a large extent. They are estimates in a certain sense in the very foundation, and the dividing arbitrarily by two, simply because there are two plants there, is not the proper method of getting at it.

Q. Well, you haven't done that in all cases.

A. I haven't done it in all cases, but in many cases I have.

Q. Well, didn't you consider it proper in this case to do so?

A. I did not. I so stated.

Q. Well, now let us take those items and state what you would consider proper.

Mr. **Mathewson**: I do not think it is fair to ask an engineer on the stand to go to work and to figure up out of his head, without time to consider, what the plant would cost for the capacity, with all the changes that might be involved.

The **Master**: If he cannot do it, he can say so. The Senator is entitled to an answer to his question.

1977 A. I will say this, that so far as possible I have checked up my expenses and estimates of the total expense, and I find that they are different. Taking the whole thing all through, my estimate was within ten per cent. of what is the cost at the present time.

Q. Well, isn't your estimate on this as good as your estimate on the rest of the plant that you have been furnishing?

A. It is not, because this is emasculated.

Q. I know, but when I ask you to state what it would cost to produce an exhauster house for ten million capacity, and you give me a figure, isn't that as good as your figure that you have given on the exhauster house, if they are set in the other plants?

A. I have not estimated on an exhauster house of ten million.

Q. The only things that I asked that we took by dividing by two were the meter house, tar, and ammonia tanks, the boiler house and the contents, and the general connections?

A. General connections, and all the piping about the works. What did you say that figure was?

Q. $3,110,021.93. Now, you stated you thought this was unfair to you as an engineer to arrive at an estimate in this way. In what way would it be dealing fairly with you?

A. You omitted all the grading, filling, and the necessary work on real estate to produce this plant. You omitted the bridge that was necessary to prepare the docks for the receipt and discharge of coal; you omitted the wharves, you omitted the coke handling plant. It is not anything like up to where it should be.

Q. Well, I think your criticism on the whole as to the coal storage and coke plant is probably well founded and we will take that. What would be the value of a coal storage and coke plant necessary to handle these articles in a 10,000,000 daily 1978 capacity plant? Do not bother with anything in my question except the coke and coal?

A. No, I cannot take it to pieces in that way. I would only be making a fool of myself and wasting time and I don't want to be the "goat."

Q. Well, I will be the "goat."

A. The coke and coal is only a small portion of it.

Q. I know, that is what I want.

A. The coke and coal handling business would be $500,000, or $250,000 for the half.

Q. That raises our total to $3,360,021.93.

Mr. Mathewson: It raises your total, Senator, not ours.

Q. Have you an electric power plant in any of your Manhattan stations?

A. Yes, sir.

Q. But I understand that you have not this tar extractor and cyanogen?

A. No, sir.

Q. And we took the value of the tar extractor house and contents at $166,583.03?

A. Whatever it was. Yes, $166,583.03.

Q. You were connected with some of the constituent companies before the consolidation, were you not, as engineer?

A. May I ask you to define "constituent companies?"

Q. By constituent companies I refer to the companies that consolidated and became the Consolidated Gas Company?

A. I was.

Q. You became the engineer, did you, of the Consolidated Company, upon the consolidation?

A. No, sir, two years afterwards. The consolidation was in November, 1884; I became Chief Engineer in December, 1886.

Q. Are you familiar with the capacity of the various plants that were taken over by the consolidation?

1979 A. Except in a general way. Up to the time of my absolute connection with them I had no knowledge of the capacities of the other plants.

Q. But within two years after the consolidation you took charge and then of course you had knowledge?

A. Yes. Within two or three years and I became familiar with it—three or four years.

Q. Have there been any substantial changes in that time in those plants?

A. Yes, a great many changes.

Q. In the way of increased capacity?

A. Increased capacity.

Q. Now you know what the increases were, do you?

A. I know generally that the increased capacity of the past 20 years has nearly doubled; nearly, if not quite.

Q. Yes, in the past 20 years it has doubled, but I am speaking about the time when you became familiar with them, between that and November, 1884, had there been any substantial increases in the capacity of the plants, two years having elapsed?

A. I don't understand the question.

Q. You took charge in 1886?

A. I took charge in December, 1886.

Q. And the consolidation took place in 1884?

A. Yes.

Q. Now, between November, 1884, and December, 1886, had there been any substantial changes in the plant?

A. That I cannot say, because I had nothing to do with any of the companies except my own.

Q. Which was your own?

A. The Municipal and Knickerbocker. Now the 44th and 99th Street Stations.

Q. You know what the capacities were when you took charge in 1886?

A. Between twenty-seven and twenty-eight million, if my recollection serves me. I cannot give to a few feet or a thousand feet.

1980 Q. Could you give me approximately the capacity of the various plants at that time—14th Street plant?

A. I may give it approximately. Twenty years is a long time to remember back on a thousand feet of gas. I should say 14th Street——

Q. If you would prefer to refresh your recollection by looking at anything so you can give it more exactly, you may do so.

A. I will see how near I can come to it.

Mr. Page: While this witness is making his computation, I will offer in evidence this statement, prepared by Mr. Bradley, from which he has been testifying.

Mr. Mathewson: I think the paper had better have some heading.

By Mr. Mathewson:

Q. What is this paper, Mr. Bradley, that the Senator has just offered in evidence?

A. It is a statement of the expenditures on the Astoria plant to May 31, 1906, the amount estimated to complete, but it does not comprise all the items necessary to the plant.

The Master: Now, take the witness' answer to the former question as to the capacity of the plants.

The Witness: Approximately, in 1886 the

14th	Street station had a capacity of	3,500,000
21st	“ “ “ “ “	5,000,000
44th	“ “ “ “ “	4,000,000
99th	“ “ “ “ “	2,500,000
18th	“ “ “ “ “	3,500,000
111th	“ “ “ “ “	2,000,000
42nd	“ “ “ “ “	4,500,000

That is somewhere near correct. It is not absolutely correct.

1981 By Mr. Mathewson:

Q. What part of 1886 do you mean? When you took charge, in December, 1886?

A. When I took charge, in December, 1886. That total is about 25,000,000.

By Mr. **Burr**:

Q. How much of that was coal gas, and how much was water gas?
Mr. **Mathewson**: Just give those that were coal gas plants.
A. Coal Gas Plants:

14th Street Station	3,500,000
18th Street Station	3,500,000
111th Street Station	2,000,000
42d Street Station	4,500,000

The rest were water gas.

At 1 P. M. a recess was declared to 2:15 P. M.

1982 After Recess.

William H. Bradley—Cross-examination continued by Mr. **Page**:

Q. The 14th Street plant to-day has a capacity of 5,000,000 cubic feet, has it not?
A. Yes, sir.
Q. Can you say when the increase was made of 1,500,000 cubic feet to that plant?
A. It was made at times; it was not made all at once; at different times during the past twenty years.
Q. The 21st Street plant to-day has 24,000,000 cubic feet capacity as against 5,000,000 cubic feet in 1886?
A. Yes, sir.
Q. Was that change made at one time or at different times?
A. The change was made at different times as the necessities of the case warranted.
Q. What is the capacity to-day of the 44th Street plant?
A. 8,500,000 cubic feet.
Q. There has been no change in the 42d Street plant in capacity?
A. No change in capacity.
Q. Has there been any change in apparatus?
A. There have been some odd little pieces of apparatus put in. I put in an additional ammonia scrubber to take the ammonia from the gas; it did not add anything to the capacity.
Q. You have some generator benches, haven't you, at 42d Street?
A. Regenerator benches, yes, sir.
Q. Have they been put in since 1886?
A. They were in at the time of consolidation.
Q. So far as addition to the plant is concerned there would be nothing practically to the credit of the 42d Street station?
A. Nothing to manufacturing capacity.
Q. The 99th Street plant is 5,500,000, now?
A. Yes.
Q. That makes a daily capacity of 47,500,000 cubic feet, and to that you will add the oil gas that is produced at the 21st
1983 Street station for the use of 14th Street, 3,500,000 feet?
A. Yes.

Q. The plants at 18th Street and 111th Street have been abandoned, so that there is no production of gas from those?

A. They were condemned, taken by the city, both of them.

Q. Well, there is no production of gas?

A. No.

Q. Then, by the wiping out of these plants the capacity of the original plants has been reduced to 19,500,000 cubic feet, the remaining balance?

A. That was nearly correct; I should say that that was right within 500,000 cubic feet, as nearly as I can estimate it, 20 years ago. (Figures.) Yes, 19,500,000 cubic feet.

Q. So that by such additions to plant that have been made in the last 20 years you have increased the capacity of your works from 19,500,000 cubic feet to 51,000,000.

A. That is correct.

Mr. Mathewson: Assuming that his estimate of the capacity in 1886 is correct.

The Witness: Yes, assuming that.

Q. Well, you are pretty sure you are right on that, aren't you?

A. I think I am right within a half million feet; I would not say beyond that.

Q. Referring to Complainant's Exhibit No. 79, which shows the variation in real estate plant, property and construction from the date of consolidation, November 11, 1884, to October 31, 1905, we find the plant, buildings, machinery and holders to have been valued on the books of the company in the amount of $12,182,491.41, and on October 31, 1905, a valuation of $16,087,428.72, showing the net increase $3,904,937.31. Is that the value as shown on the books of the company?

A. That is as shown on that Exhibit.

1984 Q. I did not finish the question—the value as shown on the books of the company of the increased plant since consolidation, less depreciation, so that $5,132,620.41 would be carried here as construction since consolidation.

A. Carried as construction since consolidation, $5,132,620.41, that is correct.

Q. And by the expenditure of that five million dollars in construction you have increased the capacity of your plant by 31,500,000 cubic feet daily; is that right?

A. That is right.

Q. I understand that you prepared a valuation of the plant which is set forth in State's Exhibit D, being the report of the Consolidated Gas Company to the State Board of Tax Commissioners of the State of New York for the year ending June 30, 1904, and that you placed the valuation of the plant and real estate as $19,673,075.42; is that right?

A. I do not recall that at all, sir.

Mr. Mathewson: Mr. Carter testified that he added the book value of the plant to the figure that he got from Mr. Bradley for the plant.

The Witness: No, sir; I did not prepare that. That is real estate and plant. I had nothing to do with real estate at all; I did not place any value on it.

Q. Then, your part of making up this figure of $19,673,075.42 was to give the valuation of the plant; is that right?

A. It was limited entirely to the plant.

Q. And you fixed that figure at $8,456,595.71?

A. About that figure; I have no recollection as to what the exact figure was. That is nearly correct, I should say.

Q. On direct-examination didn't you testify to that specific figure?

Mr. MATHEWSON: No, he said he made it up in 1902.

1985 The WITNESS: 1902.

Mr. MATHEWSON: Not 1904; and Mr. Carter stated that he employed that same figure with slight variations.

The WITNESS: As far as 1904 is concerned, if my memory serves me, I hadn't anything to do with it.

Q. In 1902 then you fixed the valuation of the plant at $8,456,595.71, is that right?

A. I do not know whether it is or not now, I cannot recall it. I simply make the statement that I made before, that I took this book value and added between $600,000 and $700,000 to it. Whatever that amount brought was the correct amount. I have not seen the figures since and have not had any occasion to refer to them.

Mr. MATHEWSON: The figure that Senator Page gives you is the figure in the tax report for 1902.

Mr. PAGE: No, the figure I just gave you is the figure you used on your direct-examination. Now, if you want to change that——

Mr. MATHEWSON: You are mistaken; he does not want to change anything.

Mr. PAGE: Let us have the explanation. Do not shy at every figure that I give you, because this is taken right from your direct testimony. Now if you want to change that, that is the figure that I took down on your direct-examination, and if you want to make any change in that make it now.

Mr. MATHEWSON: In my question, Senator, I said that the figure which was adjusted by slight variations was $8,496,000, or whatever it is there, and I expressly asked him whether he gave the figures to Mr. Carter in 1902 and he did, he said, and Mr. Carter testified that he made some slight adjustments as to changes in
1986 items made between those dates. It is perfectly clear.

Q. As I understand it, this figure that you have given here is not your testimony but Mr. Mathewson's testimony; is that right?

A. That is my testimony.

Q. Then you are willing to stand by it?

A. I am willing to stand by the statements that I made before the Gas Commission and that I made here before, that I took half the book value, whatever that value was. It was about $15,000,000, and I added to that between $600,000 and $700,000 for the figure that I gave to Mr. Carter. Now, whether it was $100 or 100 cents, more or less, I cannot say more than that. I simply speak from my memory of what transpired at that time.

Q. Now, as I understand your explanation to-day, the reason that you divided the book value of this property by one-half was that you expected the plant to be removed to Astoria?

A. We are going on then, intending to remove it.

Q. And that was in 1902?

A. 1902.

Q. And you understood that you were preparing figures to be submitted for use by the State Board of Tax Commissioners in arriving at some tax for that year, didn't you?

A. Yes, arriving at the tax for that year.

Q. How far advanced was the Astoria plant in 1902?

A. The plans were pretty well drawn; very little physical work had been done.

Q. You did not anticipate that you would be able to remove the plants during that year, did you?

A. Of course not. If I had I should have reduced it very much more.

Q. Well, did you anticipate that you would remove half of the plant that year?

A. I did not anticipate removing any in that paticular year.

1987 Q. Could not a good portion of this plant be removed to Astoria, if you merely wished to reproduce the plant there?

A. A portion of our present plant?

Q. Yes.

A. No, sir.

Q. Why not?

A. They are too much cut up into small units that are impractical to be placed on a modern up-to-date works. Everything is too small.

Q. This book value included holders, didn't it, which you divided in two?

A. It included holders.

Q. Was it ever your intention to remove the holders?

A. Not as an entirety.

Q. How did the value of the holders compare with the value of your manufacturing plant?

A. Well, in what way do you mean, in the total amount?

Q. Yes.

A. Well, they are varying all the time.

Q. In this valuation that you gave to-day of some $18,321,000, how much of that is holders and how much of that is manufacturing plants?

A. The holders is five and one-half million and the plant is twelve million eight hundred thousand.

Q. In this estimate which you made in 1902, corrected by Mr. Mathewson in 1904, how much should be taken for the value of plants and how much for the value of holders?

A. That is a question I cannot answer because I made no subdivision at the time.

Q. Would it be in about the same proportion, should you think?

A. Well, no, I would not like to say whether it would or not, because the conditions as to holders and plant are constantly changing.

Q. Did you consider the book value in 1902 represented substantially the value of the plant at that time?

A. I considered it was very nearly the value of the plant.

Q. But you think to-day that the plant is some two million
1988 dollars more valuable than the book value, is that right?

A. Yes, sir.

Q. Is that based on any theory or advice of counsel as to how to treat values for the purposes of testimony?

A. No, because since 1902 changes have been made; we have built more gas holders and put in other apparatus and made changes.

Q. And the cost of those has been carried into the book value which has increased it from $15,465,000 up to $16,080,000, I think, to-day?

A. Yes, and it is also based on the fact that I do not think the works could be reproduced for anything less than that, whatever the book value might be.

Q. How much do you consider that the occupancy of land by your plant depreciates the value of the land?

Mr. MATHEWSON: I object to that. This witness has not been shown to be an expert on land value, and does not pretend to be, I suppose.

Mr. PAGE: He says he was instructed by counsel that he should only take into consideration such buildings as added to the value of the land, and in some particulars he considered the buildings depreciated the value of the land. Now I am just inquiring as to that particular statement of his.

The MASTER: He can answer.

A. As to amount I don't know that I can say, because in the first instance I would be obliged to place a value on the real estate, which I do not think I am competent to do; but I know perfectly well that a block of ground with a gas holder on it is worth less than it would be with the gas holder not on it, because whoever purchases it would have to remove the gas holder.

Q. If it has a gas manufacturing plant on it, anyone who
1989 purchases it will have to remove that, won't he?

A. Exactly.

Q. And so to that extent, you think the existence of the plant depreciates the value of the real estate?

A. Within certain limits.

Q. What limits would you say?

A. I suppose the assessed valuation would be less; the actual valuation might be the same.

Q. Well, then you mean that the existence of a gas plant on property is valued at a depreciating factor for taxation purposes?

A. Yes, sir.

Q. But not for any other purposes?

A. Not for any other purposes; that is what I gathered from the counsel's instructions.

Q. And what counsel was it that advised you?

A. The general counsel of the company.

Q. Mr. Sterling?

A. Mr. Sterling.

Q. Have you ever sold gas apparatus that was to be removed and used in other works?

A. Oh, possibly, yes, some small articles; I don't know that I can say exactly now.

Q. Well, there is no reason why a gas holder cannot be taken apart and put up again, is there?

A. If you do not mind the expense, no.

Q. Your purifying boxes——

A. I would like to continue that a little bit, Senator.

Q. All right, sir.

A. At the time the city took away the large gas holder at 18th Street station, I made a very exhaustive estimate as to the cost of taking that holder down and erecting it in another place for our own use, and I found that when I got to the end that I could—by the time I had my gas holder and tank taken down and the sheets all marked and transported to the place where it was to be re-erected, that I could put new material on the ground for the same price.

Q. Well, take the purifying apparatus, for instance.

1990 A. The same is true of purifying apparatus.

Q. Is that true of all gas making apparatus?

A. Practically all with the exception perhaps of an exhauster, or engine, or some small piece of machinery that can be taken up bodily and transported. Any piece of apparatus that you must cut in parts or take down and re-erect is under that same category.

Q. The sale of apparatus at 18th Street and 111th Street was merely a sale of scrap, wasn't it, and it brought its scrap value?

A. Well—no, I don't think it brought in scrap value practically. The city sold it. It was sold by the City Auctioneer and I would assume that he got the best price for it that he could.

By Mr. Mathewson:

Q. Was that sold at auction as it stood?

A. Sold at auction in both cases.

By Mr. Page:

Q. In this estimate of value that you prepared in 1902 was the 18th Street plant valued?

A. The figures taken were the book values. If the 18th Street plant was in the book value it was used, otherwise not.

Q. What can you say as to whether 18th Street was in the book value in 1902 or not?

A. I should say I don't know.

Mr. Mathewson: Do you want any concession on that point, Senator?

Mr. Page: Yes, I will take it. I suppose you are willing to concede that it was, are you not?

Mr. MATHEWSON: Yes, there is no doubt about it. It had 1991 not yet been condemned. It was not in operation. We had not been paid for it and have not yet, for that matter.

Q. I do not suppose you will be able to state at what value that 18th Street plant was carried on the books of the company at that time?

A. I cannot say, sir.

Q. When you got through and arrived at this result as the valuation of your plant, what did you feel that you had valued?

A. I felt that I had valued the plant of the company for taxation purposes.

Q. And when you make your valuation of to-day of $18,321,000 you feel that you have made a valuation for testimony purposes fixed on the question of the cost of gas, is that it?

A. No, sir, I made it in testimony, but not for testimony purposes.

Q. In both instances you disregarded entirely the book value?

A. No, I did not disregard the book value, for I used that as a basis to start with, and divided it by two and worked up from that.

By Mr. MATHEWSON:

Q. You mean in 1902?

A. 1902. In the case of the last estimate I paid no attention to book value.

By Mr. PAGE:

Q. You did not take book value and add 20 per cent?

A. I did not.

Q. Just how did you arrive at this valuation of $18,321,000 for your plant?

A. I took the valuation of the coal gas plant at $400 per thousand daily capacity, and the water gas plants at $200 per thousand daily capacity, which experience has shown is not far wrong.

Q. What experience do you appeal to when you say experience has shown that to be not far wrong?

1992 A. Experience and general knowledge of what similar plants have cost and are worth.

Q. That is not taking into consideration the condition of the plant in any way?

A. It is taking in consideration the condition of the plant, because if the plant was not capable of producing that amount, you could not use that as a factor.

Q. You mean producing that amount of gas?

A. Producing that amount of gas.

Q. But it does not take in consideration whether it is such a plant as would be commercially worth reproducing?

A. I don't know that has anything to do with the case, Senator, I don't see where the connection is.

Q. No, probably not.

A. This plant is going on day after day, year after year, doing this work.

Q. But in making this estimate you did not take into consideration the fact whether or not it was doing its work economically?

A. Yes, our plants are doing their work as economically as any plants in the country.

Q. Well, the 14th Street plant, for instance, has direct fire retorts, of six retorts to the bench?

A. Yes.

Q. Do you consider that as economical a construction as full depth regenerative retorts of eight or nine to the bench?

A. So far as construction is concerned, yes.

Q. I am speaking about operation?

A. So far as operation, the benches that you mention would consume a little less coke.

Q. Use less coke and could be handled with less labor?

A. And handled with less labor.

Q. And would produce gas cheaper?

A. A little cheaper, yes, by the amount of labor saved and the amount of coke saved.

Q. Then I am to understand that this value that you arrived at
had nothing to do with the physical conditions or practically
1993 had nothing to do with the plants as they exist to-day except the fact that they produce a certain amount of gas?

A. Except the fact that they were running every day all the time producing the gas that we wanted of a candle-power sufficient to conform with the law.

Q. But in arriving at your result you took the amount of gas produced and multiplied it in one instance by four hundred and in the other instance by 200?

A. I took the amount that the works were capable of producing in any one day.

Q. Yes, and that was irrespective of what the works themselves were?

A. Yes. You could treat my works in the same manner.

Q. Yes.

A. But given a plant that was all run down and of no special value either in production or in economy and I should probably reduce that figure somewhat if I was to make an estimate in the same way.

Q. Would you use $400 as the unit to ascertain the value of the Astoria plant and multiply twenty million feet by four hundred?

A. It is possible that I should do that after the plant is finished and in operation so I can see what it does. Just now I should not apply any figure to it.

Q. Assuming that your plant in Astoria produces what you expect it will, 20,000,000 feet, would you say it was a proper factor to multiply that 20,000,000 by 400 to ascertain the value?

A. Not the first 20,000,000 unit, no sir, I should raise the figure considerably.

Q. How much would you raise it?

A. I should raise it to $500 or $600 without any question. This is simply assumption now.

Q. Yes. Well take six hundred. That would bring the cost of the plant at Astoria to 12 million dollars, wouldn't it?

A. Right.

1994 Q. And you have stated here that your entire value at Astoria including everything, would be some thirteen million dollars?

A. Exactly, but I think, Senator, if I am allowed to go on and build some more plants over there I can build them for less than that, because there was a lot of work done in connection with this plant that will necessarily be of value for succeeding plants, but it must be done now.

Q. Well, that work was done with the idea of having succeeding plants?

A. Exactly, and for that reason the work had to be done in connection with succeeding plants.

Q. In that estimate that you gave of thirteen million dollars there was $1,135,336.63 for land and there was over two million dollars for a tunnel?

A. That is correct, two million and sixty thousand dollars I think, if I am correct.

Q. $2,050,000?

A. Yes.

Q. There was grading $317,543.53.

A. Exactly.

Q. And dredging, $160.000, wharves, $190,000, land drainage $50,000, soundings and borings $200,000; 60-inch gas mains with pumping plant $620,000, lining of tunnel $600,000; besides tar extractor and washerhouse $167,583.03. That was included?

A. Yes.

Q. All of it would not be included in a plant when you come to estimate the value of the production at $400 per thousand cubic feet?

A. That simply illustrates what I said a few minutes ago, that the cost of much of this work would be spread over other works subsequently erected, but it must be spent now.

Q. Does it cost less to manufacture one plant that will produce nine million cubic feet of gas than it would two plants at 4,500,000 feet each?

A. That is purely a theoretical proposition and simply——

Q. Well we are dealing largely with theories, aren't we?

A. I am not, I am dealing with facts.

1995 Q. Well, let us theorize on your facts, then. You take a unit of $400 as the value of producing a coal gas plant of any capacity. Now I say if you divide that in two plants, situated one at 42nd Street and the other at 14th Street, would it cost more to produce those two plants than it would to produce one plant, producing the same amount of gas?

A. It would, per thousand cubic feet.

Q. Yes?

A. Yes.

Q. Then is that unit of multiplication which you applied based upon reproducing a plant at 14th Street of 5,000,000 feet, and a plant at 42nd Street of 4½ million feet capacity?

A. Based upon the production of the plants as they stood, not with any idea of splitting them up into small units or combining them together, but taking them as they stood as a fact.

Q. Then your idea is that as these two plants stand, to reproduce them it would cost in each instance $400 per unit of thousand cubic feet capacity?

A. Yes, sir.

Q. That does not include real estate?

A. That does not include real estate. It includes buildings, so far as buildings are classed as real estate, but not land.

Q. If you were going to reproduce to-day a gas plant to produce the entire amount of gas that is now manufactured by the Consolidated Gas Company, would you reproduce these plants?

A. I think that question is answered by the very work I am engaged on now in the Astoria plant. It is not a reproduction of these plants.

Q. And the kind of apparatus that is in use in these particular plants is not the kind you are installing in Astoria, is it?

A. In many cases it is identical, absolutely identical, with the exception that it is larger.

Q. That I suppose would apply to the purifiers?

1996 A. Purifiers, engines, exhausters, condensers, meters, holders, and 90 per cent. is identical. The retorts are precisely the same, the horizontal retorts, with the exception there are two more in an oven; absolutely the same otherwise.

Q. Well, the full depth generator furnaces?

A. The furnaces are different in some cases. We have the full depth generator furnaces at 42nd Street to-day.

Q. You also have helf depth?

A. Also have half depth at 14th Street.

Q. Half depth at 42nd Street?

A. At 42nd Street, yes, sir.

Q. And at 14th Street you have direct fire?

A. At 14th Street, we have some half depth furnaces there which I have built since I was chief engineer.

Q. Well, you haven't done as Mr. Mayer did, taken an inventory of the property?

A. I have not.

Q. And estimated what it would cost to reproduce that identical property?

A. I have not.

Q. Have you made any recent inspection of the apparatus with an idea of making this estimate?

A. What estimate?

Q. That you have given to-day of $18,321,000.

A. Do you speak of mine or Mr. Mayer's?

Q. Oh, yours.

A. I have made no recent, absolute inspection for the purpose. I am familiar with the works and make inspections of them day after day, year after year. It is not necessary to start out and make a formal visit of inspection. I know it now.

Q. When you decided in 1902 to disregard the book value of the plant, did you take into consideration that the book value of the plant as entered on the books of the Consolidated Gas Company in 1884 was very much larger than the book value of the same plant on the books of the various constituent companies?

1997 A. I don't think it can be said that I disregarded the book values, because, as I said before, I started with them as a basis.

Q. But then you reduced it?

A. I did not disregard it. I reduced it.

Q. I wanted to know whether that fact had any influence on your mind?

A. If you will give me the rest of the question——

Mr. **Page**: The stenographer will repeat it.

The **Stenographer** (reading): When you decided in 1902 to disregard the book value of the plant, did you take into consideration that the book value of the plant as entered on the books of the Consolidated Gas Company in 1884 was very much larger than the book value of the same plant on the books of the various constituent companies?

Mr. **Mathewson**: I have to make objection to that. It appears affirmatively that it was not the same plant that was taken over from the constituent companies, and I don't see how the question could have any application. Those plants were never on the books of the constituent companies.

The **Master**: I will let him answer it.

Exception.

A. I took into consideration the figures of the book value of the plant, knowing that money had been spent on them, that they had been increased in capacity and efficiency. I must have known it was more than it was at consolidation.

Q. I don't think you have entirely caught my question. I wanted to know whether the fact that the plants as taken over in 1884 were entered on the books of the Consolidated Gas Company at a larger sum than they had been carried on the books of the constituent companies that consolidated, whether you took into consideration that fact?

1998 A. That is a question I cannot answer because I did not know that fact. If it was so I was not aware of it.

Q. In making this estimate that you have made for the value of the plant to-day you have not taken into consideration then the original cost of the plant and added to it the cost of such additions as have been made since?

A. No, I did not consider the original cost of the plant. That had no bearing whatever on the present value of the plant.

Q. You did not take into consideration the value of the additions that had been made under your own supervision?

A. Certainly I took them into consideration. A plant that in 1884 produced 25,000,000 and I know in fact they produce 51,000,000 now, I must have taken it into consideration. In other words, there would have been no addition to the value if that remained the same.

Q. We have a plant in 1886 that produced 19,500,000 cubic feet of gas?

A. Yes.

Q. You did not take into consideration what it would cost to produce that plant and add to it $5,132,620, which you have expended in additions since to bring that up to a 51,000,000 cubic foot plant, did you?

A. I am not in the habit of doing foolish things of that kind, Senator.

Q. Well, you did not do that?

A. I did not do that, no sir, I should not think I was doing justice to myself, my company, or anybody else if I did.

Q. We have got an estimate here of $18,321,000, which does not represent the cost of it, it does not represent what it would cost to reproduce a plant of that capacity to-day, it does not represent the book value of the plant. Now what does it represent?

A. It represents my opinion of the value.

Q. Based on what?

A. On my knowledge and a long experience as an engineer and being competent to make those valuations.

1999 Q. Well, would this be the value of the plant new to-day?

A. It is my estimate of the value of the plants of the Consolidated Gas Company, their worth to the gas company as a gas producing apparatus capable of producing a certain amount of gas per day and bringing in a certain revenue.

Q. But it is not taking into consideration the question as to whether or not another plant could not be built that would produce the same revenue at a very much less cost, is it?

A. No.

Q. Now, as I understand, you took the value of the coal gas plant at $400 and the value of a water gas plant at $200; is that right?

A. Yes, sir.

Q. And you got 9,500,000 cubic feet—Oh, is this daily capacity?

A. Daily capacity.

Q. What daily capacity did you use for your coal gas plant?

A. 13,000,000.

Q. 13,000,000 what?

A. Cubic feet.

Q. Of coal gas?

A. Coal gas.

Q. Your estimate included then 18th Street?

A. Included 18th Street.

Q. Then you are reproducing more than you have got to-day?

A. Perhaps for an adjustment that might be eliminated.

Q. Well, we want to get at the idea you had. Now taking 13,000,000 of coal gas, multiplying it by 400; what do you get?

A. $5,200,000.

Q. What amount of water gas did you take?

A. I took 3,900,000.

Q. It must be more than that?

A. 39,000,000. I left off a cipher.

Q. Will you multiply that by $200?

A. That should have been 38,000,000 instead of 39,000,000. $7,600,000.

Q. $7,600,000?

A. Yes, sir.

Q. If you add those together you get $12,800,000?

A. $12,800,000.

Q. As against your estimate given here of $18,321,000?

A. That's right.

2000 Q. And if we take the $3,500,000 from the 18th Street, it brings it down to $12,200,000?

A. Yes, sir. There are some gas holders to go in there besides that.

By Mr. MATHEWSON:

Q. How about the oil gas at 21st Street? Is that in?

(No answer.)

By Mr. PAGE:

Q. You stated on your direct examination that the estimate that you gave at that time of $18,321,000 included apparatus, buildings and the gas holders?

A. I did.

Q. And I asked you how you arrived at that and you said by multiplying the coal gas plants by $400 and the water gas plants by $200?

A. So I did. So far as you asked me and as far as I went.

Mr. MATHEWSON: He has already testified that the twelve hundred and odd millions——

Mr. PAGE: Now, never mind, Mr. Mathewson, let the witness answer it.

Mr. MATHEWSON: But he has testified to it already.

Mr. PAGE: Never mind. We will straighten it out.

Q. What unit would you use then as a multiplier to get your holders in if you have left the holders out?

A. I did not leave them out. They were in there. I used $125 per thousand feet of capacity.

Q. For holders?

A. For all of them, by and large.

Q. Then in using $400 as a unit of multiplication to ascertain the value of the Astoria plant we would have to eliminate the holder also in our calculations to verify the correctness of your unit, would we? 2001

A. Oh, yes, it would have to come out.

Q. What holder capacity did you multiply at $125 to produce the holder value?

A. 40,123,000.

Q. Is that the entire holder capacity?

A. No, sir, there are 503,000 to be added to that for the 18th Street holders taken by the city.

Q. Did you use that?

A. I used that. In my judgment that was the property of the company because it has never been paid for.

Q. The company will get interest on the award, won't it?

A. That don't pay the principal.

Q. What?

A. That don't pay the principal.

Q. Well, if they get the principal they will get interest with it?

Mr. MATHEWSON: I don't suppose he knows.

A. Some time, I hope.

Q. Since making the figures for taxation purposes based on the idea that the plant was going to remove to Astoria, you have very much modified your plans, haven't you, in regard to the removal of the plant, so that it will probably be a great many years before the plant is removed, if ever?

A. Well, yes, there is an uncertainty which has come into it since that time. The plans are not as well defined as they were three years ago.

Q. In the condition of the art, both of construction of plants and the manufacture of the product, a water gas plant is much more cheaply constructed and produces gas much cheaper than a coal gas plant, does it not?

A. The first proposition is right; it is more cheaply constructed for a given capacity. The second is not entirely correct. It was correct some few years ago, but the increasing difficulties of the oil supply and the reduction in quality and quantity and consequent in-
2002 crease in price, those things are bringing the cost of water gas pretty nearly to the cost of coal gas at the present time.

Q. It costs you to manufacture gas at the 14th Street station, according to the figures given by your company, 37 cents per thousand cubic feet. The cost at the water gas stations is about 29 cents per thousand cubic feet, is it not?

A. My answer was based on your question as to the state of the art, not speaking of any individual instance.

Mr. MATHEWSON: I think, Senator, you are wrong in your figures.

The WITNESS: Possibly he may be, I do not know.

Mr. PAGE: There is a possibility of course. You know I qualified that by stating "the figures given by your company."

Mr. MATHEWSON: I do not think you have quoted the figures accurately. I think you have inadvertently quoted the wrong figures.

The MASTER: How is it material? It has not affected the witness's answer. He says he has made the statement in view of the state of the art, and not with regard to a concrete instance at all.

The WITNESS: That was the question as I understood it.

Q. In the present state of the art, manufacturing in a modern up-to-date plant and making the recoveries of the by-product, as they do to-day, you say you can produce coal gas as cheaply as you can water gas?

A. There is another factor that comes in there; that is the illuminating power, the candle-power.

Q. Well, of the same candle-power?

A. Of the same candle-power, no, we can produce water gas cheaper.

2003 Q. I am of course referring to conditions as they obtain here in New York, not a general proposition, that you can produce coal gas unenriched?

A. Well, when you ask me a question of that kind, I must give you a straight answer. You simply say gas. Gas is gas, whether it is coal gas or water gas. When you come to candle-power, that is a different proposition.

Q. Well, modify the question to the extent of stating 22-candle-power, both coal and water.

A. 22-candle-power, both coal and water can be produced in my judgment some cheaper by the water gas method, but not so much as years ago.

Q. I understand that it is your expectation to build the Astoria plant entirely as a coal gas plant?

A. The present unit is a coal gas plant.

Q. Well, future units; how about that?

A. That is looking to the future.

Q. We have been doing a good deal of that?

A. I know; altogether too much.

Q. Well, we will cast our horoscope a little farther now.

A. The question as to whether I shall recommend the Consolidated Gas Company to build a water gas plant in Astoria next, or whether I shall advise them to keep on with coal gas plants, is yet in abeyance. I cannot say from the present standpoint what I will do.

Q. The original intention was to produce entirely a coal gas plant. Is that right?

A. No; my original intention was to have both coal and water gas.

Q. According to my recollection I thought you stated that before the Gas Commission.

Mr. Mathewson: I think your recollection is at fault. I think it was clearly testified—I know it was by Mr. Addicks—that it was contemplated to build a water gas plant there, or unit.

2004 The Witness: I have plans in my office showing water gas as well as coal gas. That is the best evidence.

Q. How is the gas that is manufactured by other companies under agency agreements delivered to your company?

A. It is delivered in two different ways. Some of it is delivered direct into our gas holders, and some of it is delivered direct into the mains.

Q. What companies deliver it to the gas holders?

A. All of them.

Q. What companies deliver it to the mains?

A. All of them.

Q. Where are the deliveries made to the mains from the different companies?

A. In the streets, various connections that we have. I do not know that I can absolutely define where those are. Mr. Simpson can answer that question a good deal better than I can, as he has direct charge of that and I only have general supervision of it.

Q. Mr. Simpson is still to come on, so that I will not bother you about that. As chief engineer of the company, do you have records in your possession which show what it costs to produce gas at each station?

A. No, sir, I do not.

Q. You have general supervision of the production of gas, haven't you?

A. Yes.

Q. And it is part of your duty as chief engineer of the company to keep the cost down to the lowest effective point, isn't it?

A. It is.

Q. And don't you ever make calculations to find out if you are doing that?

A. I do not.

Q. If you want to know, to whom would you go?

A. Mr. Carter. My office is in the general office of the company, and the accountants and bookkeepers are all there, and if I want any information I simply ask the question and get it.

2005 Q. For the purpose of supervising the daily production, what reports are made to you?

A. To me personally none at all. Reports of the amount of gas made, the amount of gas sent out and the gas received from other companies come into my office and are there filed. I see them when I wish to for any reason.

The Master: I have been looking over this record very hard to find out what was brought out at the direct examination that this cross-examination is applicable to just at this point, but I do not seem to find it. Can you tell me?

Mr. Page: I do not know that it is, and if it does not seem to be productive, I will abandon it.

Mr. Burr: I want to ask Mr. Bradley a few questions if you have finished.

Mr. Page: I think so; go ahead.

Recross-examination by Mr. Burr:

Q. By whom was the statement prepared which has been offered in evidence to-day, which was presented by you?

A. Which statement?

Mr. Page: State's Exhibit V.

A. That was prepared in my office, under my supervision, by my assistants.

Q. From the books kept in your office?

A. From the books kept in the general office.

Q. And you know those figures to be correct, yourself?

A. So far as I have been able to check them over and examine them I have found everything correct, and I assume that the rest are.

Q. The plant at Astoria is to be an up-to-date and improved construction, I understood you to say; it is not to be a reproduction of the construction which at present exists on the Island of Manhattan? 2006

A. That is my intention, to build the best plant in the world.

Q. Is it not a fact that improved instruction means cheapening of the cost of construction of gas?

A. I hope so, I hope to be able to produce it, but I will not sit here and state under oath that I am going to produce it cheaper; I intend to, that is my aim; but I may fail.

Q. In your opinion, when the Astoria plant is running it will result in a considerable reduction in the cost of the manufacture of gas?

A. I hope so.

Q. And would that extend to as much as 5 cents per thousand cubic feet?

A. No, sir.

Q. Do you recall being examined before the Gas Commission on that subject and testifying that it would result in a reduction of from 5 to 6 cents per thousand cubic feet?

A. I recollect that I protested against that examination, as I did not wish to be committed.

Q. Do you recall being examined before the Gas Commission and testifying that in your opinion the result of the construction of the Astoria plant would be a reduction in the cost of the manufacture of gas from five to six cents?

A. No, sir, I do not recall that.

Mr. Mathewson: He did not so testify; therefore he could not recall it.

Q. I call your attention to your testimony as it appears on page 746 of the printed record before the Gas Commission. You were asked this question?

"Q. Of course, when you get running smoothly and everything is as you have planned it to be, you anticipate a considerable reduction in gas? A. I anticipate a reduction.

2007 Q. To what extent? A. Perhaps to five or six cents a thousand."

Did you so testify?

A. I said perhaps five or six cents. I did not say that there would be a reduction of five or six cents a thousand feet.

Mr. Mathewson: Those were not questions which were put to the witnesses before the Gas Commission at all: that relates to questions which were put to him, and they were questions which were put to him before the Stevens Investigating Committee, and he stated before the Gas Commission that his testimony was misunderstood and he fully explained what he meant to convey before the Gas Commission. Those questions were not asked him.

Mr. Burr: These are the questions that appear here on the printed record.

Mr. Mathewson: Of course, they were read in by counsel for the complainant before the Gas Commission, but he did not so testify before the Gas Commission. On the contrary he explained fully.

Mr. Burr: I do not think that calls for a statement on the part of counsel. The witness is entirely competent to take care of himself.

Mr. Mathewson: But you stated that that was his testimony before the Gas Commission; stated it flatly, and it is not so.

*B*r. Burr: I have read the statement which appears on page 746 of the printed record.

The Master: I assume that you do not want to entrap him?

Mr. Burr: No, sir.

The Witness: I did not testify before the Gas Commission to that effect; the questions were not asked me.

2008 Q. So that we may understand each other, you did so testify before the Stevens Investigating Committee?

A. I did so testify before the Stevens Investigating Committee. I gave it as my opinion that there might be a reduction.

Q. Then, did you testify before the Stevens Investigating Committee, when you were a witness there before that body, as follows:

"Q. Bringing it down at the holder, cost of production at what? A. In the neighborhood of thirty cents.

"Q. A little less than thirty cents? A. Maybe a cent less than thirty cents.

"Q. Maybe a cent less than thirty cents? A. Twenty-nine."

Q. Did you so testify before the Stevens Committee?

A. I testified under the statement that it was entirely speculative on my part; that I had no data to go on to make that statement.

Q. The next question you were asked before the Stevens Investigating Committee was:

"Q. What are the circumstances which enable you to figure that reduced cost at Astoria? A. Better equipment; modern equipment, an endeavor to use all the modern appliances in the shape of labor-saving and recovery of some by-products that htve never been recovered by any gas company in this country, and little economies of that character; I do not know that I can enumerate all of them."

Did you so testify?

A. I did.

You were also asked this question before the same Committee:

"Are some of your present plants out of date and somewhat antiquated? A. Yes.

2009 Q. Which plants would you bring under that category? A. The 14th Street and 42nd Street plants.

Q. In what respect are they not up to modern standard? A. They have not the modern benches, so to speak, technically to speak, that is, the retort houses, and the balance of the apparatus is not as efficient as can be produced now."

Did you so testify?

A. I do not think you read that correctly as I recollect it.

Q. I hand you the book. Look at page 746. I would like you to read the testimony that appears there as having been given by you?

A. Well, this is what I was looking for; the next question:

"Which is the apparatus which is inefficient? A. There is none of the apparatus inefficient; simply comparatively inefficient." That is what I was looking for.

Q. You now remember that you so testified?

A. I did.

Q. You were asked:

"Q. I mean comparatively? A. In the case of the 42nd Street, the benches are the old style, horizontal sixes. When I say that I mean six in number. They are worked, drawn and charged by hand. The balance of the apparatus is fairly efficient, inasmuch as apparatus of that age and character can be built in the years when it was built.

Q. How old is the apparatus? A. I cannot say absolutely. I should say in the neighborhood of 35 years. I should say 35 years as nearly as I could arrive at it. I cannot give it any nearer.

2010 Q. As I understand, that apparatus requires more labor than those perfectly modern appliances would require? A. It does.

Q. And that of course involves additional expense? A. Yes, sir.

Q. And brings up the cost of production? A. And brings up the cost of production."

Did you so testify before the Stevens Investigating Committee?

A. I did.

Q. Without any reservation whatsoever, you clearly remember that you so testified?

A. I testified with the reservation entirely all the time that it was simply speculative and now it is impossible to say.

Q. You mean when you say you have testified as I have read that you had the mental reservation as stated?

A. I always have a mental reservation when counsel asks me what I am going to do in the year 1910. I cannot tell exactly. I simply give him the best of my opinion.

The **Master**: Now Mr. Burr, what is this directed to as cross-examination.

Mr. **Burr**: On the question which I wish this chief engineer to answer, and which I am now proceeding to ask him, as to whether improved construction and up to date construction does not result in better gas and cheaper gas in its manufacture.

The **Master**: I know, but what on his direct is that suggested by? That you are making him your own witness now? I do not recall anything on his direct-examination that opened up that subject.

Mr. **Burr**: I think that he has given a statement here with regard to the cost of the plant at Astoria, and I think that I am entitled to show on this general subject of the manufacture and 2011 distribution of gas whether that plant, which is contemplated to cost so much, is going to result in the cheapening of gas, its manufacture and distribution.

The **Master**: I think that is a pretty far cry.

Mr. **Burr**: They are going to commence operations in a month or so; they hope to.

Mr. Mathewson: Will you let me see that page, if you have finished quoting from it?

The Master: I have got to take it, if you insist upon putting it down, but I do not see it on cross-examination.

The Witness: I will be better able to answer those questions a year from now.

Mr. Burr: Further, on the subject of the appraisal that he has made of the plant; he has stated it to be, in one breath, old and antiquated and I am going to call his attention the next minute to a statement made by Mr. Addicks before Mr. Justice Lacombe, as it appears on page 6 of the affidavits and notice of motion. On page 6 of the affidavits and notice of motion Mr. Addicks makes this statement:

"The manufacturing plants of the Consolidated Gas Company are in good and efficient condition; about four-fifths of the present generating capacity thereof are in shape, modern up-to-date water gas plants which could not be improved upon anywhere, and the coal gas plants, while possessed of some apparatus which is not of the latest pattern, are efficient and in shape to operate for an indefinite period without impairment of efficiency."

Do you agree with that statement?

A. That is correct.

2012 Q. Can you tell me what was the amount of gas consumed by the Consolidated Gas Company itself for its own purposes last year?

A. No, I cannot.

Q. Or the year before?

A. No; I have not any record which will show that.

Mr. Burr: I think that was one of the things I asked for, which has not yet been delivered.

The Witness: I was not asked for that, I have no record which would show it.

Q. In the Astoria plant, will you tell me what would be the weight of charges of coal in pounds used in the inclined retorts, if you can?

A. About from 1,000 to 1,200 pounds in the retorts.

Q. How many hours will be used to distil each charge?

A. That would depend upon the working of the benches, whether it is four or six hours; I cannot tell you until I get that under way.

Q. What gas would you average for a pound of gas distilled?

A. Probably 4.9 feet per pound.

Q. What would be the weight of charges used in the horizontal retorts?

A. 800 or 900 pounds probably; this is all dependent upon conditions as they come up, you know; I cannot tell that.

Q. You had it in mind when you estimated the output?

A. In a general way, yes.

Mr. Mathewson: These are through retorts, Mr. Burr, if that is of any value. Are they not, Mr. Bradley?

The Witness: Through retorts.

Mr. Mathewson: Through retorts, not single.

Q. What gas do you expect to average per pound of coal?

A. I just told you, 4.9 feet to the pound.

Q. If you were to have all your vertical and inclined retorts in operation at once how much gas would you expect to produce in twenty-four hours?

2013 A. I have never made the calculation. The house is rated at 10,000,000 feet; it may produce 13,000,000, or 15,000,000, or 8,000,000; it depends upon the working of the plant.

Q. What percentage of surplus retorts do you expect to leave out of work in ordinary work?

A. About 20 per cent.

Q. What station did you have charge of from November 1, 1884, to December 1, 1886?

A. What is now known as the 44th Street station, and the 99th Street station.

Q. What increase occurred in the capacity of those plants from November, 1884, to December 1886?

A. No special increase; nothing that I can recall now.

Q. I would like to ask you whether it is not a fact that land used solely for gas making purposes is not as valuable one year as it is another?

A. I am not a land expert; I cannot give you an answer to that question.

Q. Is the land that the Consolidated Gas Company took over in 1884 any more valuable for gas making purposes this year than it was in 1884?

A. I do not know, sir, I am not a land expert.

Q. I am speaking simply of gas purposes?

A. We do not make gas out of the land.

Q. You make it on the land?

A. We make it on the land, yes, and whether it is any more or less valuable for gas making purposes I would not like to undertake to say.

Q. If there was a gold mine under the land it would not make the gas any better or any cheaper, would it?

A. I would buy it then and I would not make any gas.

Q. Is it not a fact that for gas making purposes, the land is not any more valuable this year than it was in 1884?

A. I could not say.

Mr. Mathewson: Is not that a conclusion?

2014 The Witness: Yes, it is more valuable, I happen to think now.

Q. In what respect?

A. Because in several of the plants I have put a good deal more of apparatus on the same number of square feet, that makes it more valuable. We produce more gas per square foot of land than we did before.

Q. Is it more valuable in any other respect that you know of?

A. It is more valuable in that respect; as to any other respect I have no knowledge of it.

Q. Do you know what value or price the Consolidated Gas Company claimed for that part of the 18th Street plant taken by the city?

A. I know generally, yes.

Q. How much was it?

A. Something about a million dollars.

Q. What was the price claimed for the land and what was the price claimed for the buildings?

A. I do not know; I do not know anything about the land.

Q. You spoke something about the increasing difficulties of the oil supply and the depreciation in quality and the increase in price. Do you know what that is attributable to?

A. It is attributable in the first place to the production. Years ago when Pennsylvania oil was plenty, there was a larger percentage of the lighter bodies, naphtha and benzine, but as the years went on and the production of the Pennsylvania oil regions was reduced, the other oil fields that were discovered produced a heavier body of oil without so many of the light constituents.

Q. Whom did you purchase that oil from?

A. The Standard Oil Company.

Q. Many years ago?

A. Yes.

Q. How many years ago?

A. Since 1876.

Q. Have you purchased all of your oil from the Standard
2015 Oil Company since that year?

A. As far as I know.

Mr. MATHEWSON: Did you complete your answer as to the cause of increase in price?

The WITNESS: No, he interrupted me. The advent of automobiles, motor boats and gasoline engines, and all the various forms of use for the lighter products of petroleum have made it impossible for us to get it in quantity, and we are obliged to take the heavier product.

Q. Are you testifying now from your own knowledge or what somebody has told you?

The MASTER: Are you cross-examining on anything that he has testified to on the direct, or only on Senator Page's cross-examination, because we must come to an end of this some time?

A. Somebody told me, and I read it and I know it.

Mr. BURR: That is all.

Redirect examination by Mr. MATHEWSON:

Q. This State's Exhibit V which you have produced, giving the expenditures for certain items at Astoria, included all the items going into the Astoria plant, did it?

A. No, sir, only a portion of them.

Q. Even the first unit?

A. Yes.

The MASTER: He said that this morning.

Q. Why was this statement made up, giving these particular items?

A. It was made up because asked for by Senator Page, as I understand it.

2016 Q. Have you in course of preparation another statement showing the items which were omitted from this?

A. I have.

Q. And which added to this make up $13,134,519.65?

A. Yes, sir.

Q. Senator Page has suggested certain items for deduction, which you said would apply not only to this unit but other units if they were built. Would not a portion of those items apply to this unit even if other units were built?

A. Undoubtedly.

Q. Then, in any event could the estimate of the cost of the first unit be wholly eliminated?

A. No, sir.

Q. You testified to a rope haulage system, coal storage yard and other items; are they included in these items in State's Exhibit V?

A. They are not included at all.

Q. And they would have to be added, would they not, to the $13,134,519.65?

A. Yes, sir.

Q. There is nothing in State's Exhibit V about the east purifier house or west condenser house or tar extractor or washer house?

A. Some of them are omitted but I think some of them are in there. The west condenser house is omitted entirely and condensing apparatus.

Q. The west purifier house and west tar extractor and washer house are included?

A. Yes.

Q. There appears here a holder, 15,000,000 cubic feet capacity. Is it possible to construct smaller holders than that at the same price per cubic foot of capacity?

A. No.

Q. Would it be more or less expensive?

A. The larger the holder the less expensive it is.

Q. Would you consider it judicious at Astoria, in view of the plans, to erect smaller holders than you are erecting?

A. It would be going backwards. In the city to-day we are taking out the smaller holders and replacing them with larger ones.

2017 Q. Are these figures in State's Exhibit V portions of the estimate of $13,134,000 to which you testified?

A. Simply a portion of it.

Q. You have stated that the generating capacity of the plants of the Consolidated Gas Company have been more than doubled since 1884. Was that increase effected in the same buildings?

A. Almost entirely.

Q. And it was not necessary to increase the buildings?

A. Very little more ground was covered.

Q. And what was the increase in generating capacity, chiefly?

A. In the case of 21st Street and 44th Street, it was in the generating capacity.

Q. Were the purifiers sufficient for a greater capacity than that of 1886?

A. No new purifiers were built. In 14th Street I put new sets in the old house.

Q. Is it possible where you have an existing plant or plants, such as the Consolidated Gas Company in 1886 had, with land, which is not covered with apparatus and building not fully covered, to increase the capacity without proportionately increasing the cost per thousand feet of output?

A. We have done so.

Q. When you speak of the salvage in case of the removal of the generating plants to Astoria as a few hundred thousand dollars, would that salvage be in the coal gas apparatus or water gas apparatus?

A. It would be in both to a certain extent.

Q. Which chiefly?

A. Mostly on the water gas apparatus.

Q. Were you informed by counsel in reference to the figures which you gave for the tax report of the provision of the law that real estate should be assessed at a price at which in ordinary circumstances it would sell?

A. Yes.

Q. And did you take into consideration what this generating apparatus would sell for if the plant were sold with it on?

2018 A. Yes, I took into consideration it would sell for scrap, and scrap only.

Q. Was that the theory on which you made up the figures?

A. That was the theory on which I made up the figures. Nobody else would want to buy it for a gas manufacturing plant.

Q. You have not ordinarily parted with any of your land or buildings for gas making plants?

A. No, sir.

Q. Would it be possible to acquire better apparatus in your judgment that that which you are now using for the manufacture of water gas or are they up to date?

Mr. Burr: Objected to as purely speculative.

Objection overruled; exception.

A. No, sir; most of the water gas apparatus has been built within the last five years and is just as modern and up to date as any we would contract for to-day.

Q. As to your coal gas, you have stated that your regenerating furnaces are somewhat more economical in operation. How about the cost?

A. They would cost more to construct them.

Q. It would add to the capital?

A. Yes, sir.

Q. If you took $400 per thousand feet as your unit what would that make the cost of a twenty-million cubic foot plant?

A. $8,000,000.

Q. Do you expect that subsequent units can be produced at less than that?

A. I expect they can be produced at less than the twelve million or thirteen million dollars.

Q. Yes, but less than the $8,000,000?

A. Well, hardly, I would not like to say that we could get much below the $8,000,000.

Q. In your $400 per thousand feet which you applied as the
value of the coal gas plant in Manhattan, did you not in-
2019 clude relief holders at the station?

A. All the relief holders at the station were included in every case.

Q. In the $400?

A. In the $400.

Q. And the holders which you have added were simply the other holders of the company?

A. Storage and distribution holders. The relief holders went in with the plant.

Q. And so with the estimate of the Astoria unit which you have given, the holder at the plant was included?

A. Yes, sir.

Q. Is the $18,321,000 which you have specified, what you consider it would cost to reproduce the plants to-day?

A. Yes, sir.

Q. It is then the cost of reproduction?

A. Cost of reproduction.

Q. Have you made any estimate of what should come off that for depreciation, if anything?

A. No——

Q. Knowing the condition of the plants?

A. With the exception, perhaps, of 18th Street.

Q. Well, leaving that out of account?

A. Yes.

Q. How much did you include in this $18,321,000 for 18th Street, both the manufacturing plant and the holders taken?

A. I cannot tell that, I do not think, without going over my figures. I took the three and one-half million production at $400, upon the plant.

Q. That would amount to how much?

A. $1,400,000. The holders I cannot say now, for I have not the figures of the capacity, that is in detail.

Q. If you cannot tell exactly, state approximately.

A. About $175,000.

Q. And that would make a total for the 18th Street plant as taken by the city?

A. No, sir; I think we are working at cross purposes. You say taken by the city?

Q. Yes, taken by the city, the portion taken by the city 2020 at 18th Street?

A. Oh, that is another thing. I understood you to say what was left. $1,903,000.

Q. And taking that out of your $18,321,000 would leave how much, excluding 18th Street on your figures?

A. $16,418,000.

Q. You state now that the plans of the company are not so well defined with reference to removing its manufacturing plants to Astoria?

A. No, sir.

Q. What is that due to?

A. To being unable to form plans until this business becomes settled down to some basis so we know what we can do.

Q. Do you mean the 80 cent gas Act?

A. 80 cent gas and all the other disturbances.

Q. What is your view as to the production of gas, as to whether it should be all water or all coal or a mixture?

A. I think it should be mixed gas.

Q. Considering the supply of oil and the course of oil as to price would you have considered it judicious to establish as the first unit at Astoria a water gas plant when that construction was begun?

A. No, sir, I considered that thing at length and concluded the best interest of all concerned, the company and the consumers and the City of New York was a coal gas plant at first.

Q. Does the raising from 20 to 22 candle-power make any difference as compared with coal and water gas and possible cost of production?

A. Yes, sir, that is one of the difficulties that I labor under now, being unable to know what I can do until I find out the candle-power requirements.

Q. In connection with the production of gas you know what material is ordered, I suppose, for that purpose, don't you?

A. I make requisitions for material.

Q. And is it your effort to see how far that material goes in producing as much gas as possible?

A. Absolutely. I have it watched very carefully by my assistants.

2021 Q. And the figures as to cost of items you have not in your department?

A. I don't trouble about the cost of items. I simply know if we use more coal than we did last month, the gas is costing more and I want to know why. And the same with oil and the various articles that go into the manufacture.

Q. When you speak of being able to produce at Astoria gas at somewhat less than you do in Manhattan, you refer to the cost of coal gas in Manhattan or water gas?

A. The cost of the coal gas in Manhattan.

Q. Would you undertake to say that you expect to produce coal gas at Astoria at a lower price than the cost of water gas at your station?

A. I don't think I will be able to.

Q. Now, in reference to the testimony before the Stevens Committee to which Mr. Burr has called your attention, the first question is where you were asked about the cost of gas at Astoria: "Bringing it down at the holder, cost of production, at what?" And in a later question which he read: "And brings up the cost of production" and your answer was: "And brings up the cost of production." Do you remember before the Stevens Committee statements were made showing the cost of gas production, which was a statement of labor and material?

A. Yes, sir.

Q. And then additional items of cost in the holder, which raised it a few cents?

A. I do.

Q. What did you understand when you said it might be 29 or 30 cents?

A. Cost of production.

Q. Not the cost in the holder?

A. No. I did not have anything to do with that.

Q. Did you so state to the Gas Commission in the testimony before them?

A. Yes, sir.

Q. As a matter of fact, the cost which you expected to re-
2022 duce at that time, so far as coal gas went, related to the
year 1904, didn't it?

A. It did.

Q. And have you effected a reduction since 1904?

A. We have effected a material reduction already.

Q. Several cents?

A. Several cents.

Q. Do you remember whether you testified before the Gas Commission that you could not say that you could reduce the cost at all?

A. If I recollect the testimony, I said that I could not keep going on at that rate forever, keep on reducing.

Q. Was that under the 20 or 22 candle-power law that you expected to do that?

A. Under the 20 candle-power law.

Q. Mr. Bradley, this estimate of $13,134,519.65 was made up some time ago, wasn't it?

A. Made up in March last—March, 1905, I think.

Q. Have you within the last few days gone over the items again to revise your estimate?

A. I have.

Q. And have you now the statement to which I called your attention a few moments ago showing the items which were not requested by Senator Page and which go into the total of $13,134,519.65?

A. Yes, sir, the items are here now.

Q. Now, the final revision of your estimate which you have completed within the last day or two makes a total of how much, anything beyond the $13,134,519.65?

A. $160,000 in addition.

Q. Making a total of how much?

A. $13,250,739.60.

Q. Does this show exactly what the items are which go to make that up which are not included in State's Exhibit V?

A. It does.

Mr. Mathewson: I offer it in evidence.

Mr. Page: I would like to call the Master's attention to the fact that last July I asked that this information be furnished. A tentative exhibit was prepared and shown to me and I made suggestions as to the form that that should be put in. To-day 2023 an exhibit is produced and handed to me for examination, and then when I have completed my cross-examination the statement is made that it is like Colonel Seller's eye wash, there is one ingredient missing, and other statements are prepared and produced under redirect-examination.

I merely wish to call your attention to the unfair way in which we have been used.

Mr. Mathewson: It is not a very serious suggestion. Here are the items requested by Senator Page, and here are those not requested by Senator Page, making up expenditures, estimates and totals, and the total added up is $13,250,000. The total of the estimate originally was $13,134,519.65. It is impossible to state the omitted items without showing the additional $116,219.95. Whenever the estimates are revised, months apart, the probability is, of course, that some other slight item will have appeared, and that is the fact, and we cannot get away from it.

Mr. Page: My request was for all the details relating to Astoria.

Mr. Mathewson: No, sir; we have your request and we will show it, showing precisely what you asked for.

Mr. Page: And it shows the *bona fides* of the complainants. They take a statement which was made up for the purpose of having them segregate certain items, and limit themselves to that instead of giving the information they knew *are* desired, tempted by the insufficiency of my request, as they claim, to produce an incomplete statement.

It is not fair to the defendant.

2024 Mr. Mathewson: Here is a copy of the request which Senator Page handed to counsel and which I handed to the company and we followed it exactly as far as possible, and showed the cost of each particular one of the items which he requested. We did not understand that we were asked to furnish more than that, and we furnished it in the form which he requested, and have now simply shown the items which were not included in the items he requested, making up the total to which Mr. Bradley has testified. There was no idea of doing anything except to accommodate the Senator.

The Master: Let us not discuss it. I suppose if he has not got all he wants he can put it in when he puts in his own case. If the facts are somewhere they can be brought out by some process known to law.

Mr. Page: I know, but I merely wish it spread upon the records as to the frankness with which we are met.

Papers received and marked Complainant's Exhibit 235.

Mr. **Mathewson**: As the city contracts are here, before taking up another witness for cross examination, I will be glad to offer one or two papers——

Mr. **Page**: You brought out one or two points on the redirect-examination that you did not touch upon on the direct. I wish to examine on them.

Recross-examination by Mr. **Page**:

Q. You say you have made a material reduction in the manufacturing cost of gas since 1904. Can you state just how much?

A. No, sir, I was informed of that fact by Mr. Carter, the general accountant, that we had made a reduction since 1904.

2025 Q. Did he inform you as to the number of cents which you had made? You said it was several cents?

A. Not as to the exact amount; several cents, as I repeated it.

Q. Those reductions were made with your present plants, 14th Street, 42d Street——

A. No, they were made by additions and improvements to our present plants.

Q. Well your present plant as it stands to-day at 14th Street and 42d Street?

A. I did not speak of 14th Street and 42d Street. I speak of the entire plant, water gas as well as coal gas.

Q. Since 1904 what improvements have you made in your water gas plant that would enable you to reduce the cost of production?

A. Changed the entire method of production both at 21st Street and 44th Street and 99th Street.

Q. Was not that done prior to your testifying before the Stevens Committee?

A. Part of it was.

Q. Well, was not all of it?

A. I think not, I cannot recall now. Well, it was done about that time.

Q. Has a part of the reduction that you made been made in your gas plant at 42d Street and 14th Street?

A. There has been no special reduction made there because there have been no special changes made there. It continues about the same.

Q. Then whatever reductions were made you should judge had been made in the manufacture of water gas?

A. In the water gas plants.

Q. But you stated in response to my question on cross-examination that with the use of the full depth regenerative retorts at Astoria that you expected to make some still further saving, didn't you?

A. We expect to make some still further saving over the old direct fire furnaces.

2026 Q. Do you know how many pounds of coke you use at 14th Street station to carbonize 100 pounds of coal?

A. Not without going to the records, I cannot state from memory.

Q. Do you recall how much gas you produced at 14th Street statoin in the year 1905?

A. No, sir, I do not carry those figures in my head.

Q. I wish to show you State's Exhibit P which will give you the entire amount of coke produced at that station and the entire amount used under the retorts. If we take the number of pounds of coal carbonized and divide it by the number of pounds of coke used under the retorts we will get at it, won't we?

A. Very nearly.

Q. You expect to be able to manufacture gas certainly in this up-to-date plant at Astoria much cheaper?

A. I hope to be able to make it cheaper and I am going to do the very best I can. If I fail it won't be for want of trying.

Q. Well, from the experience of others your faith is based upon a pretty firm foundation, isn't it?

A. It is as certain as I can be of anything.

Q. What is the difference in the cost in the holder and the cost of the production of gas?

A. The cost in the holder is the cost of the labor and the material that are used to make the gas in either of the holders. On top of that are other charges that are not ordinarily incorporated in the cost, such as fixed charges, taxes and all such items as that which are not ordinarily considered in considering the cost of gas in the holder or the cost of production, I should say.

Q. The cost of production then becomes the cost through the station meter?

A. It is the bare production in the works, yes; labor and materials.

Q. And what has to be added for the holder cost is the investment in the holder?

A. Care and supervision of holder and investment in holder, taxes, interest and all other items that are properly chargeable.

2027 Q. It takes no additional labor——?

A. We don't deal with those in the works.

Q. It takes no additional labor to get the gas from the station meter into the holder?

A. It takes additional labor to get it out again.

Q. But it goes into the holder without any additional labor?

A. No, a man has to regulate it by valves; let it in, change it from one holder to another before it gets to the holder.

Q. In the items that appear on Complainant's Exhibit 235, that do not appear on State's Exhibit V, are there any items that it would be necessary to take into consideration to find the items that would enter into a ten million cubic feet capacity plant, other than appear on State's Exhibit V?

A. These items from $767,000, "items not requested by Mr. Page," are required for the plant. All of this is required for the first plant, with the exception perhaps, of the 60-inch main. That is a portion of that $620,000. It is all necessary, the piping, the pavement, the shops, all necessary for the first plant (referring to first page of Complainant's Exhibit 235).

Q. While these items are necessary to make a complete plant for operation at Astoria, they would not be necessary for the production of a plant without relation to the conditions at Astoria, would they?

A. Well, which one? If we had a plant that was entirely built we could put new apparatus into a house, if we had a plot of ground that was paved we would not require paving. But those things must come in with the construction of a new plant absolutely.

Q. You would not have this gas pumping station at Astoria if you had a ten million capacity plant situated in Manhattan?

A. We could not move ten million feet of gas without a 2028 pumping station, any more than we could twenty million. The gas must be pumped.

Q. Not if your holder is in the immediate vicinity of your distributing mains?

A. Most of the holders are in the vicinity of the distributing mains because they are hitched to them. Not if the works were in the vicinity of the consumption, I think you meant to say.

Q. That is what I said, and what I said was distributing mains. I did not say holders. What is this 48-inch piping, $40,000 on the first page of Complainant's Exhibit 235?

A. That is piping in the works for carrying the gas around the works.

Q. And if you refer to the last page of State's Exhibit V you will find "general connections 30-inch, 36-inch and 48-inch gas piping"?

A. Yes, some of it is completed and some of it is not.

Q. You have allowed there $43,248.39 for piping of the dimensions specified, that are yet to be furnished, on the last page of State's Exhibit V?

A. That is for salt water, sewer, tar and ammonia piping.

Q. Well, my point is directed to inquire whether the 48-inch piping on the last page of State's Exhibit V comprises the 48-inch piping on the first page of Complainant's Exhibit 235?

A. No, sir, it is not the first lot of pipe, because if it was it would not be in there twice, and that is impossible.

Q. It is additional 48-inch piping?

A. It is additional 48-inch piping at the Ravenswood branch. The 60-inch main I testified to and the 48-inch piping connect the whole thing together and make a working plant of it.

Q. And to estimate on the cost of producing the ten million plant outside of the Astoria conditions, it would not include the 60-inch main, the gas pumping station at Astoria, or the 48-inch piping, would it?

A. It would under similar conditions.

2029 Q. Well, I say eliminate those conditions, confine it exactly as to what the plant has cost to produce gas?

A. In London they went out of the city and went to Beckton, they laid miles and miles of large sized pipe. This is not the only place in the world where it was done; and the pumping stations at Bowcommon and Australia Road. It has always been done by large companies. There is nothing new about it.

Q. Did they remove the holders out of London when they established the works at Beckton?

A. They did not.

By Mr. MATHEWSON:

Q. Mr. Bradley, having given a twenty million dollar plant, is it impossible from an engineering standpoint to divide by two or pursue any arbitrary rule of that kind and say how much a plant or the apparatus in a plant of half that capacity would cost, without going into a computation on the subject?

A. It is absolutely impossible, as I have stated this morning.

Mr. PAGE: I am through.

Mr. MATHEWSON: I offer in evidence certificate of the Comptroller of the City of New York, signed by J. W. Stevenson, Deputy Comptroller, dated July 6, 1904, certifying to the validity of the contract for lighting the Borough of Manhatton from March 16th, 1904, to March 15th, 1905, attached to City's Exhibit 2A.

Received in evidence and marked Complainant's Exhibit 236.

Mr. MATHEWSON: There may be other Comptroller's certificates of similar character and Mr. Burr has kindly consented to have an examination made and produce them without taking time here to go over them. 2030

Mr. BURR: If there are any such certificates attached to these contracts I will see they are presented here.

Mr. MATHEWSON: Or if there are any which are not attached but which have been executed by the Comptroller, relating to the contracts.

COLIN C. SIMPSON, recalled for cross-examination, testified as follows:

Cross-examination by Mr. PAGE:

Q. Mr. Simpson, when you were on the stand before you stated the entire mileage of the mains of the Consolidated Gas Company as 822.2 miles?

A. Yes, sir.

Q. I show you Exhibit 138 before the Gas Commission, which is the same as Complainant's Exhibit 86, with the exception that the first column, "Miles of Active Mains," has been omitted from Complainant's Exhibit 86. I call your attention to the fact that the mileage of mains as stated in 1905 was 795.47. That states it to be the miles of active mains?

A. Yes, sir.

Q. Making a difference of 27.2 miles. Now I wish to know which is the correct statement of your mileage of mains.

A. They are both correct. I stated the mileage. The miles of mains in the ground is 822.2. This statement is the miles of active mains. We have a certain mileage of mains, but where they are not in active use they can by very little expense be put in use again. Such mains are still on our books but they are not active. And this says here distinctly, "Active Mains."

2031 Q. Then all you have of active mains that are actually used in your business to-day is 795.47, that was used, I mean, up to the first of January?

A. If that statement is correct, yes, sir. I haven't it in my head. That is what active mains we have.

Q. Well, this was a statement furnished by your company?

A. I suppose it is correct.

Mr. Mathewson: It is undoubtedly correct as to what it purports to show.

Q. Your computation of value of mains as something over twelve millions of dollars was based on the active and inactive mains, the whole 822.2 miles?

A. Yes, sir.

Q. And you gave the same value to the 27.2 miles of mains that were not in use, as you did to those that were in active use?

A. Yes, sir.

Q. In arriving at your valuation of mains, exactly how did you proceed?

A. What valuation do you mean?

—. Well, we will take first the one that you testified to here, the twelve million dollars?

A. That was the reproduction value.

Q. Well, whatever you call it. That was testified to when you were on the stand the first time and gave this valuation of twelve million dollars?

A. Yes, sir.

Q. Will you state and give me your method of computation?

A. I took the cost of laying the mains under ordinary conditions; to that cost added the cost of new pavement as existing in the streets of Manhattan to-day on 90 per cent. of the mileage, that is because 90 per cent. of the streets of Manhattan are paved with new pavement at the present time. I then added for rock excavation 10 per cent. of the mileage at 1.75 cents per foot. I also added for engineering expenses, clerical expenses, city inspection, interest
2032 and wear and tear on tools and appliances, obstructions on the street which would delay the work, serious obstructions met with underground, suits for damages and other undistributed expenses.

Q. And you stated that cost $12,636,150.04?

A. Yes, sir.

Q. How many miles or feet of one and one-half inch mains are now laid under asphalt pavements?

A. That I could not tell you, sir.

Q. Can you tell me how many miles of any size mains are laid under asphalt pavement?

A. I can tell you the proportion.

Q. No, but can you tell me how many miles of 6-inch main are laid under asphalt pavement?

A. I could not tell you without going into a very long calculation, without going over all the maps, and referring to the maps showing the asphalted streets.

Q. In arriving at your result here, you did not make that kind of computation?

A. I did not, sir.

Q. In arriving at your estimate here you did not make that computation?

A. I did not. We have mains on every paved street in Manhattan, and of those paved streets 90 per cent. are asphalted streets.

Q. Well, that you state. Now, what price did you allow for reproduction of a main under a macadamized street?

A. I treated macadam as old pavement, and I allowed the smaller price.

Q. How many miles of main have you got under macadamized streets in the City of New York?

A. Twenty-seven miles.

Q. That particular matter you did take into consideration?

A. I did, although it should have come into the other, because up until two years ago we paid for macadam pavement in the city $1.50 a running foot for replacing it, and all those mains that are under
macadamized pavement were laid under that ruling, paying
2033 $1.50 per running foot; it makes more than $5.00 a square
yard. It is dearer than asphalt.

Q. In estimating the amount that you should allow for paving, what size did you allow for the trench?

A. I can read it off to you. I allowed for an inch and a half and for two inches, 2 feet 6 inches, that is, when I say width of trench, I mean width of trench repaving. The trench would be 2 feet wide, and in repaving the trench the contractor is allowed 6 inches on each side above the actual trench. That is, a trench is 2 feet wide, and he is allowed to charge for 3 feet for trim on the side. They do not always charge that, the full 6 inches on each side; some of them do not; so I took the minimum that he does take, and allowed 3 inches on each side for trim. That would bring a 2-foot trench up to 2 feet 6 inches, and the same way down, only allowing 3 inches on each side. I might further say that if anything the width of trench as given in every case is too narrow, and I think anybody will bear me out, taking the most favorable conditions as to the size of trench.

Q. What size of trench did you allow for repaving for 2 inches?

A. The same thing as for 1½ inch, 2 feet 6 inches.

Q. How far does the 2 feet 6 inches cover the inches of pipe in width?

A. It is necessary to have the trench at least 2 feet wide to work in there. Some of that pipe in there is cast-iron pipe, and they have got to get down there and lay the pipe and caulk the joints and run the joints and have working room, and you cannot work in a trench less than 2 feet wide.

Q. I say, up to how many inches in diameter of pipe would that hold good?

A. 2 feet 6 inches for 2-inch, 3 feet for 3-inch, 3 feet for 4-inch, 3 feet for 5-inch, 3 feet for 6-inch. It is possible to work in a
trench 2 feet 6 inches wide for all those sizes of pipe. When
2034 you come to the next sizes I have allowed the same for 8-inch,
10-inch and 12-inch.

Q. What size is that?

A. 3 feet 6 inches in each case. That is a 3-foot trench. For 16-

inch pipe I have allowed 4 feet; for 18-inch pipe the same, 4 feet; for 20-inch pipe I allow 4 feet 6 inches; for 24-inch pipe, 5 feet 6 inches; for 30-inch pipe, 6 feet, and for 36-inch pipe, 7 feet. In every case I figured it as if the trench was only in earth, and in rock it would not be much wider than that; it would not be possible to blast wider than that; you spoil too much pavement.

Q. Did you make any computation to ascertain how many miles of these different sizes were laid in rock and how many in dirt?

A. No, sir, I took my general knowledge of underground Manhattan and figured on that basis. I might say again that if anything I have taken almost too low a basis.

Q. You have information in your department or in the departments of the company, haven't you, to show exactly how many miles or feet of these various different varieties of mains were put down in rock?

A. No, sir; as to the mains that I have laid in recent years, that were laid under my direction, we might have that information, but the mains that were turned over at the time of consolidation and laid before my time, I know nothing at all about it; there was no record kept.

Q. Did you calculate for a new trench and for repaving in the case of each mile of pipe; did you make those computations?

A. You mean each mile separately, or how do you mean? They are different.

Q. Did you treat these as all to be laid in the different trenches at different times?

A. I did.

Q. A large number of these are laid side by side, are they not?

A. No, sir. You mean laid at the same time, side by side.

2035 Q. No, don't let us get on to that again. We had trouble enough with that when you were on the stand before. I mean not that these particular mains were laid at the same time, but if you were going to reproduce those mains?

A. I do not believe in any case, not with this mileage that I took here, that there are 15 or 20 miles that are in the same trench, of the entire total, or could be put in the same trench.

Q. I do not say that they are, but if you were going to put them down new, are there not some of them that could be put side by side?

A. If put down new?

Q. Yes, put down to-day.

A. I doubt it very much.

Q. Why?

A. There would be no object in doing that. Rather than put two or three mains in one trench we would lay one large main.

Q. And if you were reproducing this system to-day you would in many instances lay one large main to take the place of several of the smaller mains, would you not?

A. In some instances, yes, sir.

Q. Then you have taken the mains that have been laid at different times in the past 75 years in the City of New York, and estimated what it would cost to relay those same mains under the pavements as they exist to-day?

A. Yes, sir.

Q. And in doing that as I understand you have not figured for the number of miles of the different sized pipes that would be under asphalt pavements, or under any of the other pavements, but have made a general estimate?

A. I have taken the actual mileage of mains that we have. I have taken the actual percentage of streets of Manhattan that are paved with asphalt, or with granite block on concrete, and have 2036 taken 90 per cent. as under asphalt, and the other 10 per cent. as under ordinary pavement.

At 5:30 o'clock P. M. adjourned to to-morrow, Wednesday, September 12, 1906, at 10 o'clock A. M.

Last Exhibits:

Complainant's 236.
City's 44.
State's V.

2037 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Wednesday, *Sept.* 12, 1906—11 o'clock a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Kirby, Mr. Burr.

2038 Colin C. Simpson resumed and further testified.

Cross-examination by Mr. Page:

Q. When you testified before the Gas Commission, do you remember the valuation you placed upon the mains at that time, the mains of the Consolidated Gas Company?

A. I don't remember it, no.

Q. I show you page 1555 of the printed record, on which you state that at the price of pipe that prevailed in 1905 that the value would be $11,600,000?

A. Yes, sir.

Q. Has there been a substantial advance in the price of pipe since that time?

A. Yes, sir, between the time I testified. It shows on that sheet, you know.

By Mr. Mathewson:

Q. What sheet?

A. That large sheet.

Q. City's Exhibit 1 for identification?

A. Yes, sir.

By Mr. Page:

Q. That computation was made by you upon the mileage of mains that you assumed to exist at that time?

A. It was.

Q. Do you recollect what that was?

A. Yes, it was 822 miles.

Q. I refer you to page 1614 of the testimony, in which you say that the total mileage of mains was 880, and that you had been over 90 per cent. of those 880 miles?

A. Yes, sir. But without my knowledge at that time there was written off the books a good deal of mileage which would reduce it to 822 miles as I have here.

Q. But in arriving at the value of $11,600,000 you made
2039 your calculation upon 880 miles, did you not?

A. No, sir; on 822 miles.

Q. How could you make your calculation on 822 miles when you had before you 880 miles, and stated that to be the mileage and did not discover until afterwards that any portion of that had been written off?

A. I don't know. I have the mileage here before me that I made the calculation on. It is 822 miles; $11,687,466.41.

By Mr. Mathewson:

Q. Is that the same figure that appears——

A. I said there $11,600,000.

Q. What do you mean by "there"?

A. In that testimony before the Gas Commission.

Q. Well, if you had that 822 miles before you at that time, why did you state the mileage to be 880?

A. That I cannot say, sir. I say I made my valuations on 822 miles.

Q. Although you thought there were 880 miles, all of which you had been over or 90 per cent. of which you had been over?

A. Yes, sir. Those mains were in the ground and I had been over them. They were written off the books without my knowledge.

Q. In other words, the mileage of mains makes very little difference with your valuation, is that it?

A. Oh, no.

Q. If it is 880 miles it is worth $12,000,000; if it is 822 miles, it is worth $12,000,000 and if it is 795 miles it is worth $12,000,000?

A. It makes all the difference in the world. I am testifying now on the figures I took for that valuation.

Q. What did you have before you when you gave your testimony before the Gas Commission?

A. I really don't remember.

Q. Well, didn't you have a mileage sheet that showed 880 miles of mains? 2040

A. I doubt it very much.

Q. Doesn't it refresh your recollection to see that you testified before the Gas Commission that there were 880 miles of mains?

A. I might have testified that we had 880 miles of mains then. I don't say I did. But I might have testified to that effect without specifying that of that 880 some of them were disused mains that were not in my figures.

By Mr. **Mathewson**:

Q. And that had been abandoned?

A. Abandoned.

Mr. **Mathewson**: There is no doubt that there was that mileage of mains.

By Mr. **Page**:

Q. When you say you don't know whether you testified, or you might have testified, I refer you to your testimony.

A. I will say if I so testified.

Q. Well, I will read it to you:

"Q. Mr. Simpson, referring to the present mileage of mains of the Consolidated Gas Company, can you tell what the total mileage is, or approximately, if you have it in mind, what the new mileage is and what mileage represents new mains which have replaced old mains? A. The total mileage is a little over 880 miles. Of that 880 miles at least 90 per cent. are either brand new or put in condition to be as good as new mains. That is, they have been restripped, reexamined and recaulked, and in other regards, and, as I say, put in absolutely thorough condition."

That was your testimony. Now, upon that 10 per cent. of 880 would be 88? 2041

A. Whatever that testimony was, Senator, the figures I am testifying to now are the figures I gave you there to arrive at the value of 822 miles for the estimate of $11,600,000.

Q. Although you didn't know that the mileage was 822 miles until afterwards?

A. I do not say that I did not know.

Q. You have stated that you gave this figure 880 because you did not know at the time that a certain amount had been charged off, didn't know that at that time?

A. It had been written off the books, but I knew how much disused main we had, but in my estimate here I only took the 822 miles of mains we had in use.

Q. I understand what you gave in your estimate here, but what I am trying to get at is upon what you made your estimate of $11,600,000?

A. On 822 miles.

Q. (Continuing:) When at the time you stated that the mileage was 880?

A. I can only refer to my sheet which has 822 miles on it.

Q. That sheet was prepared for the purposes of this case?

A. No, it was not, sir. That sheet was prepared last December.

Q. Well, now you have given another valuation for mains for the tax report, mains and services together, of a little over five million dollars?

A. I never gave that. I never gave any tax valuation at all for services.

Q. We will leave out the services—you gave some figure on which the tax valuation was based for the purposes of taxation?

A. On the mains, yes, sir.

Q. And that was a little over four million dollars?

A. I don't know what the total was at all. I know it was about that amount.

2042 Q. I believe your testimony in that regard is that you gave the number of miles of mains and the rate, and Mr. Carter made the multiplication as you remember?

A. Yes, sir.

Q. And as a result of the rate per mile and the number of miles that you gave him, the result of that was a valuation of about five million dollars, a little over five million dollars?

A. I really cannot say. I haven't the figures at all. If he took my figures——

Q. You have never heard those figures, have you?

A. I have heard.

Q. Then why cannot you say whether those are the figures or not?

A. Because afterwards there were some amounts taken off for depreciation that I never gave him at all.

Q. Well, do you remember what figure you did give him at that time?

A. I haven't it in my head now.

Q. Have you in your head the method that you resorted to to ascertain the value of the figures at that time?

A. I have, sir.

Q. State what that is?

A. I took the cost of the laying of a main of each size under faovrable conditions.

Q. State what those favorable conditions were?

A. No rock, no extraordinary obstructions in the street, good soft earth, ordinary pavement or no pavement, and I didn't include anything for engineering expenses, clerical expenses, suits for damages, wear and tear on tools and appliances and such things as that.

Q. And I understand in arriving at the value of the mains for the purposes of taxation, as laid in the streets of New York, you assumed that they were laid in soft dirt as on a country road, did you?

A. No, I did not.

Q. Well, you state you took no valuation for pavements?

2043 A. I used my own judgment on what prices I should give at which the mains should be valued for taxation purposes.

Q. Did you seek the advice of counsel as to what was the proper method of arriving——?

A. I did not, sir.

Q. Then this was your own interpretation of the proper way of making up the returns for taxation, that you should disregard entirely the conditions under which the pipe was laid, and state the cheapest possible method of laying pipe in soft dirt and without pavement or with very cheap pavement?

A. Not absolutely the cheapest possible conditions, but extremely favorable conditions.

Q. Conditions that did not exist at all in the city of New York where the pipe was laid that you were valuing, is that right?

A. No, I don't know that either.

Q. Well, are there pavements in the streets of New York?

A. There are.

Q. Is there rock that you have to go through in the streets of New York, that you have to go through in laying your pipe?

A. Yes, sir, 10 per cent. is rock.

Q. Then you disregarded both of those pavements?

A. I did not disregard pavements. I testified I took either old pavement or no pavement.

Q. You took old pavement and you claim now 90 per cent. is new pavement?

A. Yes, sir.

Q. Therefore you disregard the conditions that existed, did you not?

A. I did not take the conditions that it would take to reproduce the mains. I took my idea of the cost of labor, leaving out certain items.

Q. Then that valuation is the valuation that you would place upon those mains as the cost to relay them?

A. No, it is not.

2044 Q. Now, when you value mains for the purpose of taxation, you assume that the mains are laid in soft earth and under very cheap pavements or no pavements at all, but when you come to place the value on mains for the purposes of this case, you assume that those mains are to be laid in rock and under the most expensive form of pavement, that is, asphalt?

Mr. Mathewson: Objected to. The witness has not sought anything. He has been called here to testify. He does not control the law as the company understands it to be. He has been asked whether that is the cost of replacement, and he has so testified. He has not sought anything.

Mr. Page: Will the witness answer or does he wish to adopt the answer of Mr. Mathewson?

The Master: Answer the question.

A. By no means. In one case I was asked what the mains could be laid for. In the other case I am giving the cost to reproduce those mains at the present date. The conditions have entirely changed since the mains were laid.

Q. You differentiate then between the question of what it would cost to lay those mains and what it would cost to reproduce those mains?

A. I absolutely do, sir.

Q. Then am I to understand that the value you put of four million or five million—or excuse me, the value that was arrived at by a computation of the figures that you gave, which amounts to some four or five million, was merely the cost of laying the mains and had nothing to do with the valve of the mains themselves.

A. It was not the cost of laying the mains.

Q. Well, that was what you were asked to give, the cost of laying the mains?

A. I did nothing of the kind. I was asked to give for taxation purposes figures for which mains could be laid.

2045 Q. That is, for what they could be laid for taxation purposes, is that it?

A. Nothing of the kind; that was not said at all. For which mains could be laid.

Q. Well, laid at that time in the City of New York?

A. Under favorable conditions. The conditions I took at that time in the City of New York, I could and did lay mains for those figures that I gave, under the conditions that I gave.

Q. That is, that was the price that you could relay those mains for at the time you made the statement, which was 1902, is that right?

A. No, sir; it is not.

Q. Well, then what did you mean by your testimony?

A. I mean that I gave figures under which mains could be laid under certain conditions. Now I do not say that those mains were all laid under those conditions.

Q. Well, they could be laid under those conditions in a country village, but could they be laid in the City of New York?

A. They could be laid under those conditions in certain streets of the City of New York.

Q. Are those the streets under which they were laid?

A. There were some streets laid under those conditions.

Q. But were they or were not the mains laid under the conditions which you took when you estimated your value at the time?

A. Some of them were and some were not.

Q. And you assumed that for the purpose of taxation that you would take the very lowest price?

A. I did, sir.

Q. At which any mains could have been laid in the City of New York?

A. No, sir.

Q. And give that as the value of the entire system?

A. I did not take the very lowest price, sir. I took a low

2046 price in laying mains under very favorable conditions.

Q. Wasn't this a fair average you took?

A. It was nothing of the kind.

Q. It was not even a fair average?

A. It was a fair average for the mains laid under the conditions that I took.

Q. Well, were those fair conditions do you think that you took?

A. I think they were.

Q. I mean by that fair conditions to estimate the value of the placing of the mains?

A. I used my own judgment on that. Whether I am right or wrong is——

Q. Well, you are using your own judgment when you give the value now, whether you are right or wrong, or is it somebody else's judgment?

A. No, it is my judgment.

Q. The figures that you gave to Mr. Carter you say were not given after consultation with counsel?

A. They were not, sir.

Q. The figures that you have given here were after consultation with counsel, were they not?

A. After the figures were made up I showed counsel how I arrived at them.

By Mr. **Mathewson**:

Q. You did not receive instruction from counsel as to the method of making them up, did you?

A. Absolutely none.

By Mr. **Page**:

Q. Well, did you from any other officer of the company?

A. No, sir. I will say this, that in making up my figures I conferred with the officers of the company and told them what my ideas were and how I was going to make them up and they approved of the way they were made up.

2047 Q. Have you had any substantial increase in services in the past year?

A. No, sir; not in number.

Q. Do you remember what you stated the value of the services to be before the Gas Commission?

A. I don't remember, no, sir.

Q. Do you think there would be any difference from the value of the services that you have given here to-day?

A. Do you mean the services as laid or the reproduction of them?

Q. Well, I suppose we will have to say the reproduction value.

A. There would be considerable difference.

Q. That is, you would consider the reproduction value a great deal more now than you did before the Gas Commission?

A. No, sir, I said the conditions under which they were laid and the reproduction value.

Q. I am talking of the reproduction values given before the Gas Commission and the reproduction values given by you here. What conditions are there that would make it more expensive to lay services in 1905 than it would to-day?

A. There are not any conditions that would make it more expensive to lay services in 1905 than to-day.

Q. What is it that would make it cost more to relay those to-day than it did then?

A. What makes it cost more to relay them? I don't know that it costs any more. If you give me the figures I will know what I am talking about.

Q. But I want to get at the reasons before we take the figures?

A. I don't know that I gave figures last year, reproduction values that are less than they are to-day, than I am giving to-day.

Q. Well, if you did, did you make an error in doing so?

Mr. MATHEWSON: Isn't that a little extreme, before you find out whether they correspond or not? It seems to me a waste of 2048 time. It is to entrap the witness. If you show him the figures he can answer.

A. I will say this, if you give me the dates you are talking about in 1905——

Q. Yes.

A. Was it the spring of 1905?

Q. October 21st, I think was the date.

Mr. MATHEWSON: No, he testified in January, late in January, 1906, as to the cost of reproduction.

The MASTER: I think if you are going to try and impeach the witness by confronting him with some inconsistent statement, it is only fair that you should call his attention to it, Senator, and let him know what he testified to before.

Mr. PAGE: Don't you think it is fair to get at whether there was any change in the conditions?

The MASTER: That is not the point. You assume in your last question. You say, assuming that you did do so and so, would it be correct or incorrect? I think it is hardly fair to the witness.

Mr. PAGE: Well, I do not want to be unfair to the witness.

The MASTER: It has taken it a little in the realm of speculation because it does not appear yet that he did testify as you suggest.

Q. At page 1556 of the record before the Gas Commission, you said in answer to this question:

"Q. How about the $1,227,931.86 at which they appear on the books of the company? A. A very fair figure indeed."

Mr. MATHEWSON: If you will read the testimony you will 2049 find that that related to an entirely different thing, the original cost of installation. He also testified at that time as to what it would cost to reproduce the mains at that time, and the figures are absolutely identical with those to which he has testified here before this tribunal. He testified from the same sheet, as he has already said, that he now has before him, and from which he testified before this Master.

Mr. PAGE: I only find those two figures, one at page 1556 and another at page 1615. If there is any other than those two figures given, I would like to have it pointed out.

Mr. Mathewson: That is a clerical error in taking down the question. It had reference to the book value, as you will see by the question; it is $1,222,000 in one case and $1,212,000 in another. I used each one in my question, and they both related to the same item, and there has been an error of the stenographers in taking them down.

Mr. Page: I had not reference to the second figure at all.

Mr. Mathewson: The figure that he gave was of the cost of reproduction, $1,934,000.

Mr. Page: Where does that appear?

Mr. Mathewson: He was recalled. The testimony you have before you is the testimony where he was recalled.

Mr. Page: I want to be absolutely fair to the witness. I take the only figures I can find.

Mr. Mathewson: The book value as of October 31st, 1905, was $1,212,071.09, as appears by the exhibit in evidence, and that was the figure that I used in asking as to the cost of original installation, and which he said was a very low figure, in fact, $14 per
2050 service. At another place I asked him what it would cost to reproduce mains and services at that time under conditions prevailing in January, 1906, when he testified, and he gave precisely the same figures as he has given here before the special Master.

Mr. Page: Let us see; on page 1615 it says:

"By Mr. Mathewson:

Q. What in your judgment would it cost to reproduce the services at present in New York City under present conditions? A. Very close on to two million dollars."

Is that it?

Mr. Mathewson: That is it.

Mr. Page: Then he did not give the figure of $1,994,034.35?

Mr. Mathewson: I said he gave it substantially. I did not say he gave it to a cent.

Mr. Page: You said he had this sheet before him and gave those figures.

The Witness: That was as to the mains; I did not have the sheet before me. I gave that from my head.

Q. Then, would you say that the service would not cost any more to reproduce to-day than it did in 1905, when you testified before the Gas Commission?

A. The same number of services would not, no, sir.

Q. The services in the Consolidated Gas Company. You have already stated, I believe, that there has been no substantial change?

A. I testified before the Gas Commission that it would cost $1,994,000 to reproduce those services as of October 31, 1905. I testified here and I said about two million dollars, not having
2051 the exact figures before me, referring to the same date.

Q. Don't you just want to transpose that—that you testified before the Gas Commission it would be about two million dollars and here $1,994,000.

A. No, I do not think I do. I think I testifiedd here it would be about two million dollars.

Q. I do not know that this is very necessary, but if you will turn to page 291 of your testimony in this record, and also to the page that I have just called your attention to, of the Gas Commission record, you will find that you testified before the Gas Commission that it would cost about two million dollars and that here you gave the exact figures as $1,994,034.35?

A. If that is the case, then I was mistaken.

Q. There is your testimony there (shows witness page 291 of the present minutes)?

A. Yes, sir.

Q. Then it would not cost more to lay those services to-day or reproduce them to-day than it would a year ago, October 31, 1905?

A. For the same number and the same size of services it would cost slightly more on account of the additional new pavements being put down since that date; also on account of the advance in price of pipe and labor.

By Mr. **Kirby**:

Q. Have you charge of the work of connecting up the services and meters of consumers?

A. No, sir.

Q. That is not in your department?

A. No, sir.

By Mr. **Page**:

Q. You have been referred to as the authority as to where the gas was delivered, from the various subsidiary companies, into the mains of the Consolidated Gas Company. Can you tell me where
2052 those gas connections are between the mains of the Standard and the mains of the Consolidated Gas Company?

A. Yes.

Q. Where are they?

A. The principal connection is at 132d Street and Broadway; there the Standard delivers gas into our 30-inch main; also into a 20-inch main going to Inwood, and at 125th Street and Fifth Avenue, and at 125th Street and Eighth Avenue through our connections between the New Amsterdam mains and the Consolidated mains, for the purpose of reenforcing the New Amsterdam pressure.

Q. That is, your gas goes into the mains of the New Amsterdam company?

A. Yes. At 130th Street and Fifth Avenue and 135th Street and Lenox Avenue; there is a connection at each place between the Consolidated mains and the Standard mains, also for the purpose of reenforcing the Standard pressure from the Consolidated mains. Those are practically all the connections we have at the present time.

By Mr. **Mathewson**:

Q. Except at the holders?

A. I am not testifying about holders; I was asked about mains.

Mr. **Page**: I asked as to the mains.

By Mr. **Page**:

Q. Where do you get the gas from the Mutual; how do you take that?

—. The gas from the Mutual—there is no gas taken into the mains of the Consolidated Gas Company from the Mutual at all.

Q. I say, where do you take it?

A. We have a 30-inch main between the 14th Street station and the Mutual works, and the gas is taken from the Mutual to the 14th Street station through that 30-inch main.

2053 Q. And delivered to the holders at 14th Street?

A. Yes, or sent further up town from there if necessary.

The Master: I call attention to the fact that this line of examination is not cross-examination of anything that was asked about on direct.

Mr. **Page**: That may be. I presume I am going ahead then under the pains and penalties, whatever they may be.

Q. You stated there is also some gas delivered by the New Amsterdam and the Standard to the holders of the Consolidated Gas Company?

A. Yes, sir.

Recross-examination by Mr. **Burr**:

Q. I want to ask if it is possible, Mr. Simpson, to prepare a list, from the books or data, of the streets, giving each block and its length in feet, and also the number of mains in that block and the size of each main?

A. I could do it by six months' steady work.

Q. You have the books in which that information is contained?

A. Yes, we have. We have books containing the mileage of each size of main, but as to the size of each block—we have maps, but that would have to be all scaled off and it would be out of the question, it would take months.

Q. Scaling?

A. Yes, you would have to scale every block in the City of New York, from the Battery to Kingsbridge. Every block in New York has four sides, and you would have to scale all four sides of every block in New York City.

Redirect examination by Mr. **Mathewson**:

Q. When you spoke of the 90 per cent. of the pavements of New York being asphalt, as I understood you to say in one answer, 2054 did you mean asphalted or improved pavement of one kind or another?

A. New pavement, what we call new pavement.

Q. Either asphalted——?

A. (Interrupting.) Asphalted or asphalt blocks, or wood blocks, or granite block on concrete.

Q. And the paving that you allowed in your estimate of the value of mains, you stated was 3 inches wider in each case than the trench you would be obliged to dig?

A. Yes.

Q. So that taking the width allowed for repaving, the trench in each case would be 6 inches wider than the amount allowed for repaving?

A. Yes.

The MASTER: I think he has stated that before.

Mr. MATHEWSON: Yes, but the statement was not quite clear as to the width of the trench.

Q. Referring to Exhibit 168 before the Gas Commission, which is the same as Complainant's Exhibit 86 except as to the column relating to miles of mains, this exhibit showed, did it not, the average sales per mile of mains?

A. Yes, but I see by this item——

Q. (Interrupting.) I understand; but this Exhibit 168 did show that?

A. Yes.

Q. So that the mains used in that computation were the mains to which services were actually hitched up at the time?

A. Yes.

Q. That appears in this Exhibit as 175.47?

A. Yes.

Q. If I understand correctly, there are about 77 miles additional, or 880 in all, which were not abandoned mains, but at that moment were not attached to services.

2055 Mr. PAGE: I object to that as not stating the testimony that the witness gave.

Mr. BURR: I object to it also as suggestive and leading; and there is no such testimony.

The MASTER: He is entitled to lead him to some extent, of course. Ask him what the fact is about it.

Q. Were any of the 822 miles to which you have testified, and for which you have given a valuation, abandoned?

A. No, sir, not abandoned, they were disused.

Q. Beyond the 822 miles there were other miles of mains that were abandoned?

A. No, they were not abandoned, they were disused.

Q. I say, above the 822 miles?

A. Oh, above, yes.

Q. So that the amount of mains abandoned and not abandoned would be something over 880 miles?

A. Yes, sir.

Q. In your testimony as to the cost of reproduction of mains before the Gas Commission and before this tribunal, did you have before you the same sheet, City's Exhibit 1 for identification, which you have had to-day?

A. I did, sir.

Q. And were the values at that time made up as they then existed, that is, of January, 1906?

A. They were.

Q. Upon the mileage of mains that existed on October 31, 1905?

A. Yes.

Q. Now, in reference to the tax report, you have stated that the figures which you gave to Mr. Carter represented the figures at which you could lay some mains in some streets? Did that take into account the laying of mains in rock?

A. No, sir.

Q. Or any engineering expense?

A. No, sir.

Q. Would it, in your judgment, be possible to reproduce the mains to-day for the figures shown in the tax report?

A. No, sir.

2056 Q. Or services?

A. No, sir.

Q. Could they ever have been installed, in your judgment, at those figures, taking them all together?

A. No, sir.

Q. Your attention has been called by Senator Page to your testimony before the Gas Commission in which you stated the book value was a very low value for services. Upon what basis were you testifying at that time. What had you been asked, the cost of reproduction, or the original cost of installation?

A. The original cost of installation.

Q. And also, as to the book value of the mains you were asked a similar question, and you said that was a low value?

A. Yes.

Q. What did that refer to?

A. The cost of installation.

Q. The original cost?

A. Yes.

Q. Does that in any way modify your testimony as to the cost of reproduction on January 1, 1906, of the mileage as of October 31, 1905?

A. No, sir.

Q. Did you give any different testimony before the Gas Commission than that which you have given here, as to values?

A. None whatever, except that one instance where Senator Page said I said about two million dollars, and in one case I said $1,994,000.

Q. In the other case?

A. Yes.

Q. Would the figures that you gave Mr. Carter, then, for the cost of laying some mains in some street, be a fair average of the total cost of laying all the mains in the streets, mile for mile?

A. It would not.

Q. Was your testimony as to value or originial cost of reproduction or installation before the Gas Commission true, according to your best belief?

A. What was that?

Q. Was the testimony that you gave before the Gas Commission

2057 and to which your attention is called, as to the original cost of installation, in fact true, according to your information and judgment?

A. It was.

Mr. MATHEWSON: If the Master please, I desire to offer in evidence one or two documents.

I have subpœnaed, if the Master please, and desire to offer in evidence, notice from the State Board of Tax Commissioners to the Department of Taxes and Assessments of the City of New York, of assessments of special franchises of the company for the year 1906, $31,900,000. Mr. Burr was not familiar with those facts and therefore he preferred that I bring the papers rather than to concede it.

Received in evidence and marked Complainant's Exhibit No. 237.

Mr. MATHEWSON: I offer in evidence from the assessment roll, real estate of corporations, City of New York, 1906, produced from the office of the Receiver of Taxes, the following entries on page 6:

Under the heading of "Owner or Occupant," Consolidated Gas Company of New York. See New York Gas Light Company, Manhattan Gas Light Company, Harlem Gas Light Company, Municipal Gas Light Company (Manhattan and the Bronx), Metropolitan Gas Light Company. The next column, under the heading "Description of Property," conduits, wires, mains, pipes, connections and tracks, Sections 1, 2, 3, 4, 5, 6, 7, 8.

Under the heading "Ward, Lot or Map Number," third column, 12.

Fourth column, under "Value of such Real Property," $1,500.

Under next column, "Tax, dollars and cents," 22.18.

2058 Under next column in which there is an entry "Value of Special Franchises fixed by State Board of Tax Commissioners," $31,900,000.

Under the next heading, "Tax, dollars and cents," $471,769.10.

Under the next heading, "Total Tax, dollars and cents," $471,791.28.

Under the column marked "Arrears," the word arrears.

I also read in evidence from page 15 of said assessment roll the following entries, Harlem Gas Light Company, Consolidated Gas Company of New York, under the heading "Owner or Occupant," next column, "Description of Property," mains, pipes and appurtenances, Sections 5, 6, 7, 8.

Under "Ward, Lot or Map Number" 602, under "Value of such Real Property," $845,000. Under "Tax," $12,496.70.

I also offer the following entries from page 21 of the said assessment roll, under the heading "Owner or Occupant," Manhattan Gas Light Company, Consolidated Gas Company of New York. Under "Description of Property," mains, pipes and appurtenances, Sections 2, 3, 4, 5. Under "Ward, Lot or Map Number" 600. Under "Value of such Real Property," $1,140,000. Under "Tax," $21,296.16.

I also offer, under the heading "Owner or Occupant," Metropolitan Gas Light Company, Consolidated Gas Company of New York.

Under "Description of Property," mains, pipes and appurtenances, Sections 3, 4, 5. Under "Ward, Lot or Map Number" 601. Under "Value of such Real Property," $1,210,000. Under "Tax," $17,894.69.

2059 Again, under "Owner or Occupant," Municipal Gas Light Company, successor to Municipal Oxygen Gas Light Company, Consolidated Gas Company of New York. Under "Description of Property," mains, pipes and appurtenances, Sections 2, 3, 4, 5. Under "Ward, Lot or Map Number" 603. Under "Value of such Real Property," $860,000. Under "Tax," $12,718.54.

I also read from page 27 the following entries:

Under "Owner or Occupant," New York Gas Light Company, Consolidated Gas Company of New York. Under "Description of Property," mains, pipes and appurtenances, Sections 1, 2, 3. Under "Ward, Lot or Map Number" 599. Under "Value of such Real Property," $1,080,000. Under "Tax," $15,972.12.

This assessment roll is not the assessment roll for the Borough of the Bronx, and would not cover any assessment of the Municipal Gas Light Company in that Borough.

Here a recess was taken until 2:15 o'clock P. M.

EMERSON MCMILLIN, called as a witness on behalf of the complainant, being duly sworn, testified as follows:

Direct examination by Mr. MATHEWSON:

Q. Where do you reside?

A. New York City.

Q. What is your business?

A. Banker, among other things.

Q. How long have you been a banker?

A. 15 years.

Q. Is your place of business in New York City?

A. 40 Wall Street.

2060 Q. Have you had any experience in the management of public utility corporations?

A. Yes, 35 or 40 years.

Q. Have you ever owned or controlled any of them?

A. Very many of them, yes, sir.

Q. Including gas companies?

A. Many.

Q. In what sections of the country have you managed, owned or controlled?

A. New York, Ohio, Michigan, Wisconsin, Illinois, Texas, Alabama, Minnesota, and perhaps other States that I cannot recall now.

Q. Have you bought or sold public utility corporations, gas companies and electric?

A. I have bought a good many and sold a few.

Q. Are you familiar with the basis of return which is expected on the purchase of gas property upon the investment made?

A. Yes.

Q. According to your experience and your knowledge which you have acquired in the business, what rate of return on the investment in the business is required to induce purchasers?

Mr. Page: Objected to on the same grounds as to similar questions asked Mr. Halsey yesterday.
Mr. Burr: We join in that objection.
Objection overruled. Exception taken by Mr. Page and Mr. Burr.

A. Of course the locality and the environment have much to do with it, but it would range at the start from 9 to 15 per cent.
Q. In the case of your long experience, what rate of return do you require on any investment in order to purchase?
The same objections, ruling and exception.
A. I would have to see in the near future, if not at the time of purchase, 10 per cent. or better.
2031 Q. On the value of the property devoted to public use?
A. On what it cost me to purchase?
Q. Would it in your judgment be possible to interest capital in the acquisition or establishment of public utility corporations of the character of a gas company with a less expectation of earning capacity than 10 per cent.?

Mr. Burr: I object to that as being speculative.
Mr. Page: The same objection.
Objections overruled. Exceptions taken by *by* Mr. Page and Mr. Burr.

A. Of course I can hardly say, but I would think that it is not probable.
Q. Is that based on your own experience?
A. Yes, sir.
Q. When you speak of an earning capacity of 10 per cent. do you mean to imply that the entire 10 per cent. be paid out in dividends or from securities?
A. No, sir, there might be none of it paid out.
Q. Or a part might be paid, and a part turned into plant?
A. Yes, sir.
Q. In reference to gas companies, what can you say as to the risks and hazards of that business as compared with other businesses, public utility corporations?

Mr. Page: I object to that; he has not been shown to be an expert.
The Master: Yes, he says he has managed and operated companies all over the country. I overrule the objection.
Exception taken by Mr. Page.

A. At present, and for the past two or three years, I have regarded them as almost extra hazardous, owing to the municipal own-
2032 ership excitement and the disposition of legislatures and city councils to cut down the price of gas, the shorter periods for franchises, things of that character, and in some instances where the public themselves are permitted to fix the price by vote, as in the case in one city.
Q. In estimating, or testifying to a return of at least 10 per cent.

necessary to interest investors, what sort of franchises did you assume that a company to which you have reference possess?

A. Those that I have purchased on that basis, or that I had in mind at the time I made that remark were, perhaps, better as to conditions than the average. Some of them were perpetual and some of them were perpetual and exclusive. One of the largest, perpetual and exclusive, had been litigated and had been settled by the Supreme Court. Others were of limited periods, but where there was a very kindly feeling towards the company. Those were properties that are now controlled by a holding company, to which I converted them. Others are very much more hazardous and are not in a holding company, and I did not have them in mind when I spoke.

Q. When you referred to 10 per cent. earnings, I presume you mean net earnings above cost of operation?

A. Net earnings above everything, every possible cost.

Q. Assuming that the franchises were not perpetual or were in litigation, would you consider that that would affect the return which would be expected if you were to invest?

A. Well, the scope of conditions that might exist is so tremendous that it might be that I would not give anything for it.

Q. It would not affect it favorably, at any rate?

A. I would not name a price that I would pay for stocks where it was open.

2083 Cross-examination by Mr. PAGE:

Q. You are the president of a corporation which controls a great many gas companies, are you not?

A. Yes.

Q. What is the name of that corporation?

A. The American Light and Traction Company is the chief one. I am president of another corporation which controls some.

Q. Do you expect the earnings of a gas company to be sufficient, as I understand, to pay 10 per cent. dividends on the stock?

A. I said 10 per cent. earnings.

Q. That is, that the earnings above the expenses should show a surplus of ten per cent.?

A. Yes.

Q. Now, would you reckon in as expenses anything more than the expense of producing and distributing the gas?

A. Everything that would be a proper charge against it in the manufacture and distribution, original expense, taxes, and the expense of keeping the property in proper repair for economical work—everything that would be properly chargeable to the profit and loss.

Q. By money invested I suppose you mean the amount of capital that is actually invested in the plant, do you not?

A. There I refer to the price that I would pay for the property if I were purchasing the property.

Q. What relation has that to the capital stock or bonded indebtedness?

A. Not necessarily anything.

Q. Then you mean, do you, the amount which you would pay would represent practically original investment, if the plant was worth as much as originally paid for it, and if not, would you offer that?

A. I did not catch that.

Q. Well, a plant that had been in existence for a number 2064 of years and was probably more or less depreciated on that account; you would take its present condition in offering a price for it, without regard to the original cost?

A. I should not pay any attention to the original cost in figuring up its value. I should figure on what it would do, or what I would think it would do under our management, and, of course, take into consideration the character of the franchise and other conditions locally.

Q. And would you take into consideration the economy that your management and large experience in handling gas plants could introduce into this particular plant?

A. Yes, if there were any that I could see.

Cross-examination by Mr. Burr:

Q. Are you familiar with the names of the companies that were consolidated in the Consolidated Gas Company?

A. Can I give you the names?

Q. Do you know the companies that were consolidated into the Consolidated Gas Company?

A. Oh, do I know the names here, consolidated into the Consolidated Gas Company? No, only in a general way. You refer to the old consolidated, back in 1884?

Q. In 1884.

A. The New York, the Knickerbocker, the Metropolitan—there were several; they used to be familiar to me, but I do not know that I can recall them now.

Q. Do you know that the Consolidated Gas Company buys gas from companies called subsidiary companies—the Standard, the New Amsterdam and the Mutual?

A. I have seen that so stated, yes, sir; but I do not know it to be a fact.

Q. Were you at any time connected with those companies?

A. I was at one time connected with the Standard, and with the East River. I built the East River.

2065 Q. How long since?

A. It is ten years since I was connected with the Standard Company. I think [illegible] is thirteen or fourteen years since the East River was built; probably twelve or thirteen years.

Q. Are you a stockholder in the Consolidated Gas Company?

A. Never was.

Q. As I understand you, the price at which you would be able to dispose of stocks or bonds of public utility corporations is based very largely on whether they have the right to do as they please or whether the Legislature has power to interfere with them at all?

A. I believe it is recognized all over the United States that the Legislature can interfere; it is not in question.

Q. And according to your opinion or judgment, where the Legislature could not interfere, or where the people did not have the power to control prices, you could sell such stock better than you could under conditions where the people had control over the prices and the Legislature could interfere?

A. No, I think that gas stocks that have been steadiest in their value are those in the States, as far as I know, where there has been Legislative and municipal interference; that is in the State of Ohio.

Q. In a large city, where a gas company had a monopoly of the business, and the consumption *per capita* was the largest in the world, would you say that to sell the stock of such a company ten per cent. would be insisted upon by you or by your clientele?

A. Of earnings, yes, with present conditions.

Q. What do you mean by present conditions?

A. That is known in a very general way to all of us, but not in any way specifically—public feeling.

Q. A spirit of unrest as expressed toward public uitlity corporations?

A. A spirit of unrest, yes, that expresses it.

2066 Q. You mean the dissatisfaction with public utility corporations generally?

A. I do not know whether it is dissatisfaction or not, but it is excitement and an effort by the political and municipal bodies to interfere with the management, and a disposition to fix prices, sometimes apparently without much regard to what it may cost. That tends, of course, to depreciate the value of the stock, to my mind. I would pay less for it under conditions than those that prevailed some time ago.

Q. That would be true of railroads, where discussion arose relative to the control of railroads by the government; for instance, the rate bill which has just been passed; that might affect temporarily the value or selling price of stocks and bonds of such railroads?

A. I think it did, yes.

Q. Would you desire to be understood as saying that a return of six per cent. upon the actual investment in the gas business was confiscation?

Mr. **Mathewson**: I object to that as a conclusion.

The **Master**: I will let him answer it.

A. Returns—do you mean an earning or a payment?

Q. First as an earning?

A. As an earning I would not care to have stock in a company that could not earn but six per cent.

Q. And now, as a payment?

A. Well, if it was earning enough, I would not myself be so particular as to what was paid. Most people would. Stock that pays large dividends would be more popular than stock which paid small ones.

Redirect-examination by Mr. **Mathewson**:

Q. When you say thirteen or fourteen years, in reference to the Standard, do you mean that you were connected with that company for that period, or since that? 2067

A. No, it is that long since I was connected with it. I was only connected with it a few months as vice-president of the company.

Q. When you speak of ten per cent. on the cost of the property which you would purchase, as the return that you would require in order to interest yourself in it, if the company that you were purchasing was established in a large community and had a large number of connections and an established business and franchises, might you not pay more for it than the actual cost of the tangible plant?

A. Oh, yes; it might have assets that I would give a good deal for, outside of the plant.

Q. When you speak of what you pay for it, you refer to what you might have to pay to acquire the whole thing?

A. Yes.

Mr. **Burr**: To what he might have to pay?

Mr. **Mathewson**: Yes.

Mr. **Burr**: That is objectionable, because it is all speculation.

The **Master**: The same objection is open to a good deal of testimony on both sides.

Samuel L. Bertron, called as a witness on behalf of the complainant, being duly sworn, testified as follows:

Direct examination by Mr. **Mathewson**:

Q. Where do you reside, Mr. Bertron?

A. New York.

Q. What is your business?

A. Banking.

Q. How long have you been in the banking business?

A. Nineteen years.

2068 Q. Have you ever had any experience in the purchase or sale of public utility corporations, such as lighting companies?

A. Yes, a good deal.

Q. For what period?

A. For the last twelve years.

Q. Are you familiar with the selling prices of stocks and bonds generally of such corporations?

A. Fairly so.

Q. Do you know the rate of return which is required by investors to induce them to invest in properties like gas companies?

Mr. **Page**: Objected to on the same grounds as before stated.

Mr. **Burr**: Same objection.

The **Master**: Same ruling.

Mr. Page and Mr. Burr except.

A. The investor's point of view is ordinarily largely that of the banker's point of view; in other words the ordinary investor is governed quite largely by the character of the house that brings out an investment of that sort and their method of handling such an investment. We all have more or less a large number of clients that are governed by our recommendations.

Q. And in the purchase or sale, what rate of return is effective and what rate do you expect to receive upon your investment?

A. We never consider such a proposition unless it is earning as much as 8 per cent. and we expect to get more than that out of it. If we should buy one on that basis it would be because we knew we could very largely increase our income by our development of the property.

Q. Is this confined to your own experience or is that your information as to the action of others?

A. I think it is very general among those who have had experience.

2069 Q. And in case you found a business which was established and had connections with customers and franchises, would the amount which you pay for property be more than the value of the tangible property for the manufacture of gas?

A. Why, we don't consider so much what the assets of that particular property are worth when we buy. We take into consideration, of course, the amount of money necessary to put the property into the shape that we want it, and then above all else, the franchise situation, and whether or not the consumption can be largely increased or not; that, of course, being governed largely by the price at which it is selling. Those are very important matters.

Q. If it had an established business, would that be taken into your estimate of what you would pay for it?

A. Yes, but that is not likely, because we generally know about what we can do in a given community and we know what we can produce for, what the population is and what the ordinary consumption in that locality is.

Q. Would it, in your judgment, be possible to interest capital in the acquisition or establishment of a gas business on a less expectation of returns than 10 per cent. on the amount of investment in the business?

Mr. Burr: Objected to on the grounds heretofore stated.

Mr. Kirby: We join in that objection.

The Master: Same ruling.

Mr. Burr and Mr. Kirby except.

A. That is general, and just now I think there is less disposition than at any time since I have been in the business to invest in gas securities, and I think it is very difficult just now to sell a property at any reasonable figure. Possibly the best illustration of 2070 that, if you desire me to make this statement, is in connection with the company of which Mr. McMillan is President. That company owns and controls a number of very successful gas properties and it is known to be well managed. The stock of that company sells to-day at about 113, and the company is earning between 17 and 18 per cent. on that stock.

Q. When you speak of the earning capacity being at least 10 per cent., do you mean necessarily that dividends at that rate would be paid?

A. Oh, it is not a question of dividends. Everybody who knows the business is governed by the returns. No company can pay all it earns and be safely managed.

Q. Are there not many prominent railway systems whose stock is selling on as high a basis as nine or ten per cent. of the earning capacity of the system as it is shown?

A. Yes, the Atchison stock was being sold, for instance, until very recently, in the neighborhood of 90; it is higher now.

By Mr. Page:

Q. Do you mean that pays 90 per cent. dividends?

A. No, 12 per cent. He is speaking of earnings, I understand. Pennsylvania stock selling at about 140 showed last year about 12½ per cent. and that included a large deduction that had been in the way of interest charges, by reason of the great number of bonds that they have sold for improvements, upon which there is no return as yet, and I should think the Pennsylvania was a typical railway property, as it certainly has the confidence of the people in its management.

Cross-examination by Mr. Kirby:

2071 Q. You have stated in purchasing a gas property you do not pay material consideration to what the tangible assets are worth. Did I understand you correctly in that?

A. Well, in a general sense, yes. They are considered, because to arrive at an earning there must be tangible assets there, and we buy it on its present earning basis, having in mind largely what we can do in the way of development.

Q. Upon what value do you base your ten per cent. earnings?

A. I don't understand you.

Q. You have stated that you consider that gas companies should earn ten per cent. over and above the expenses?

A. The price we should pay for them.

Q. And you base that ten per cent. on the price which you could purchase them for?

A. Yes, sir.

Q. Irrespective of the capitalization or bonded indebtedness?

A. Yes, sir; I do not care about that.

Cross-examination by Mr. Page:

Q. When you refer to these railroad companies earning 17 per cent. and 12 per cent., that is the net earning of the operating system?

A. As shown in their statement.

Q. Now, the road that you cited particularly, the Atchison, but a few years ago was in the hands of a receiver, was it not?

A. Yes, in 1894, some twelve years ago.

Cross-examination by Mr. **Burr**:

Q. What is the highest grade of investment at present in the United States?

A. You mean that brings in the lowest income?

Q. Yes.

A. Government bonds.

Q. Now, assuming that gas is a public necessity, and that a corporation has a monopoly of the supply of gas in the City of New York, and that the consumption of that gas is greater *per capita* 2072 than in any other city in the United States, would you still say that before you could float any stock of that company you would require ten per cent. on the price that you paid for the stock?

A. Well, your question in reference to the government bonds brings up a point that I think many fail to consider in arriving at an investment basis. Now, my judgment is that government bonds are selling entirely on an artificial basis. You see, they are required for the circulation of the banks, and so on. They must have them and certain other investments must be made in government bonds.

Q. What do United States Government bonds sell for to-day?

A. On a two per cent. basis, and the reason for that is that a bank taking them for circulation can make another certain profit for circulation. If they were simply governed by general investment conditions, they would not sell on such a basis, I do not think; in other words, it is no indication of the value of money in the open market.

Q. But the certainty of the return is just as fixed in the case of the company that I have spoken of as it is in the case of the government bonds, is it not?

A. You mean the New York City Gas Company?

Q. Yes.

A. I misunderstood your question. Be good enough to state it again.

Q. I say, assuming that gas is a public necessity, and that a company has a monopoly of the supply of that public necessity in the City of New York, where the consumption of that commodity is greater *per capita* than in any other city in the world, would you not say that the return, whatever it might be, on an investment in that company would be a certain investment?

A. Yes, if they have got to use gas, and nothing else is going to take its place, and if they have a monopoly. I mean by that if they have no encroachment, then it makes it a safe investment, 2073 and it would certainly sell on a better basis than the returns we have been discussing.

Q. So, in such a case as that it would not be necessary for you or your clients to be assured of a ten per cent. basis?

A. Not with sufficient guarantees to that effect.

Redirect examination by Mr. **Mathewson**:

Q. When you speak of net earnings in case of the Atchison and these other systems, don't you mean net earnings on the par of the securities?

A. I mean the amount shown to be earned on the stock.

Q. Over operating and fixed charges?

A. Over all charges.

Q. The Atchison Company which was foreclosed years ago was a different corporation than the present, was it not?

A. Quite.

Q. And the system is quite different to-day?

A. It has been thoroughly rehabilitated in the public mind, and also in its management.

Q. And in your reply to Mr. Burr in reference to gas in New York City would you not also have to take in consideration or to assume that a sufficient price would be allowed for gas to establish a proper return on the investment?

A. That would be a proper guarantee; yes, sir, certainly.

ALLEN B. FORBES, called as a witness on behalf of the complainant, being duly sworn, testified as follows:

Direct examination by Mr. MATHEWSON:

Q. Where do you reside, Mr. Forbes?

A. New York City.

Q. What is your business?

A. I am a banker, member of the firm of N. W. Harris & Co.

2074 Q. They are in business in New York City?

A. New York City, Chicago and Boston.

Q. Have they had and have you had experience in dealing with securities of municipal corporations and public utility corporations, and other securities of that character?

A. We have dealt very largely in securities of such corporations.

Q. During what period?

A. The firm has dealt largely through its entire existence, for a matter of twenty-five years.

Q. Have you and your firm, either alone or in conjunction with others, had experience in the purchase or sale of public utility corporations?

A. We have had experience. Our business is primarily, and in fact altogether, the business of dealing in bonds, but we have had in connection with that a varied experience in connection with the purchase of properties and the prices at which they have been sold, &c.

Q. Are you familiar with the rates of return which are required by your firm and others of whom you have knowledge upon the purchase or the cost of utility corporations such as gas companies?

A. I am in a general way familiar.

Mr. PAGE: Same objection to this.

Mr. BURR: Same objection.

The MASTER: Same ruling.

Mr. Burr and Mr. Page except.

Q. Will you state what rate is required to attract investment in that regard?

A. I should say, calculating all the hazards which the conservative banks and investors calculate, that the net return which could be seen at the time of the purchase or within a very reasonable future should be at least 10 per cent. and in a great many cases it should be a great deal more.

2075 Q. Is it not a fact that some corporations which are not subject to the hazards of the public utility corporations, well known established corporations, pay more than 10 per cent., upon the price at which they sell?

A. I believe that that is the case.

Q. How about the United States Steel Corporation, preferred stock, two or three years ago?

A. I believe that that showed earnings considerably in excess of the amount stated.

Q. Did it not yield an income of something like 12 or 14 per cent. at its selling price?

A. That is my recollection.

Q. Would you consider that a less hazardous form of investment, the preferred stock of that company, than a gas corporation under present conditions?

A. That is largely a matter of opinion, I should think it was considerably less hazardous than a great many gas corporations.

Cross-examination by Mr. Kirby:

Q. What do you consider the hazards which bring you to your conclusion of the return on the investment?

A. Well, in the first place, the gas business is to some extent an industrial business; quite a large production of the revenue of gas companies is derived from the sale of fuel; it is in competition with coal and it is in competition, looking ahead from a banker's standpoint, with some new form of fuel; I don't know what it is, but it has been variously discussed. It is subject also to new forms of taxation and increased taxation. I remember when franchises were not taxed in New York State. And now they are.

Mr. Burr: Is that a sign of progress?

The Witness: I am not prepared to say; I think perhaps it is. And the gas business fluctuates more or less with the general business conditions of a community. Gas as an illuminant also may be displaced; a good many people found it was temporarily by electricity, and it may be displaced by some new illuminant. The conservative banker should take all those things into consideration before recommending securities to his clients. 2076

Q. Your new illuminant has not as yet been discovered, has it?

A. I believe not.

Q. And your criticism as to taxation applies to all corporations, doesn't it?

A. I think it particularly applies to public service corporations more than to any others.

Q. But no more to one public service corporation than another?

A. No, I think not.

Q. Your criticism as to fuel applies to all industrial corporations, doesn't it?

A. It does.

Q. Do you class a gas corporation as more hazardous than an ordinary industrial corporation?

A. No, not than the ordinary industrial corporation where conditions of franchises, etc., are satisfactory, but where conditions of franchises are not satisfactory, where the temper of the community is uncertain, I regard it as hazardous.

Q. In regard to franchises, don't you consider the question of whether or not the franchises had been tested by the court as to whether or not they are exclusive bears a very great influence upon the return to be expected on the property?

A. It does.

Q. And that if a corporation had an exclusive franchise and a monoply of the district in which it operated that its expected return and the value of its property would be greater than when it did not have such a monoply and such an exclusive business?

A. I think that is right.

Q. What do you base your 1 per cent. return upon?

2077 A. Partly on the idea that you have got to have a certain return in order to get the money, that is considering the purchase of a gas corporation, for instance, and in order to get that money and have people feel safe in advancing it, you have got to have a margin above that which will take care of all contingencies, and there are all kinds of contingencies facing the conduct of the business.

Q. What do you mean when you say your money, the money which you have to actually expend to buy that gas business?

A. Yes, or which had been expended from time to time in building it up.

Q. In buying it and building it up?

A. In buying it and building it up.

Q. That would be the basis of your 10 per cent. calculation; in other words you would expect that company to earn over and above its running expenses——

A. Over and above its running expenses, including maintenance.

Q. Over and above its running expenses including maintenance?

A. Yes.

Q. Ten per cent. upon the amount of money that had been invested and in the purchase of the plant, and since that time in renewals and replacements?

A. Well, I would say on the reasonable value of the plant.

Q. What do you mean by that?

A. Well, the value of the property as you have indicated it, plus whatever value it had for good will and established business. A gas property starting in a new city would have to operate for a year or perhaps two years before it developed a business and would be without return for that time, therefore I should think it conservative to capitalize the loss of return that the people who built have experienced while it was being built up.

Q. But Mr. McMillan has testified that he expected a larger return during that period by reason of not having established a business. Would that be your conclusion?

A. I do not understand your question.

2078 Q. That where business had not been established you would expect more than 10 per cent. on your capitalization?

A. Yes, I would.

Q. So therefore you would not at the time of your purchase capitalize on a future value?

A. Well, I have not been discussing the question of capitalization.

Q. You would not pay for the property more than its value at that time?

A. I would not pay for the property more than what I thought was its value.

Q. As of the day of purchase?

A. As of the day it was purchased.

By Mr. **Burr**:

Q. What corporations do you group under the head of public utility corporations?

A. We group in our own business street railroads, gas companies and electric lighting companies under that head.

Q. Not steam railroads?

A. We do not in our own business. We regard steam railroads securities as an entirely different class.

Q. But you recognize that in another sense apart from your own business that steam railroads are also public utility corporations?

A. In a general sense, yes.

Q. What gas companies did you have in mind when you said that you found it was necessary to have this 10 per cent. assured before you could dispose of their bonds and stocks?

A. I should say in the case of practically any gas company.

Q. Have you in mind any special gas company that you have had experience with in the past?

A. No.

Q. This is merely a general statement covering existing conditions as you find them?

A. Yes, based on my own knowledge.

2079 Q. And where gas is a public necessity and a company has a monopoly of the supply of this necessity in a city such as the City of New York, and where the consumption *per capita* is greater than in any other city in the world, would you require such an assurance of ten per cent. as you would in the case of other companies you have in mind?

A. I think specific in the City of New York; I should.

Q. For what particular reason?

A. Because of the general tendency.

Q. Do you mean——

A. Towards reduction of rates, which is something which a banker has to consider; it bothers him; he cannot figure what the return is going to be.

Q. I understand. It is a tendency to be dissatisfied with the operation of public utility corporations, is that it?

A. It is a tendency to regulate them, which cannot entirely be gauged by a banker.

Q. A tendency to regulate them?

A. To regulate prices.

Redirect examination by Mr. MATHEWSON:

Q. If you were dealing with a gas corporation or for a gas corporation which had already an output greater *per capita* than any other city in the world, there would not be the same chance for increase, in your mind, would there, as though there was a very small output *per capita?*

A. No.

Q. And the opportunity of development in the future is a considerable element, is it not, in the price which you paid for the property?

A. Yes.

Q. You were asked whether if an company had an exclusive monopoly, to use my friend's expression, to manufacture and distribute gas in New York City or elsewhere, that would not make it more valuable. Would you not, if it had such a monopoly as that,
2080 expect to pay more for it when you purchased it?

A. Yes.

Q. In other words, the figure upon which you would expect a ten per cent. return would be increased; that is, the cost, by reason of that monopoly, would it not?

A. Yes.

By Mr. PAGE:

Q. Would you not be willing to pay a price that would show less than ten per cent. return?

A. If you could guarantee earnings, this would be a different proposition, but you are talking about the earnings from the operation and skill of the men operating this property, and taking into account all the contingencies of business and everything else. I do not believe that it is a conservative policy to reckon that an amount can be paid unless that amount is considerably less than the apparent earnings.

Q. You are familiar with the prices paid in the open market for Consolidated Gas Company stock?

A. In a general way, yes, sir.

Q. And you know that while it was paying eight per cent. dividends with gas at one dollar, that stock was selling at over 200?

A. I believe that is a fact.

Q. And that under the present law, at a price of eighty cents, the public is paying over 140 for the stock, although they have reduced their dividends to four per cent., don't you?

A. Yes, and I know further that there are many corporations that are not paying dividends at all which are selling their stock on the stock exchange.

Q. Do any of them sell over par?

A. I don't know.

Q. Well, you know that they do not, don't you? Stock 2081 that is not paying dividends and has not paid dividends for some time past, is not selling at par?

A. I would not think it would, but there are some odd things on the exchange.

By Mr. **Kirby**:

Q. Not of a well-known recognized corporation?

A. Not usually.

By Mr. **Mathewson**:

Q. Do you know that the Consolidated Gas Company owns the greater part of the stock of the electric companies?

A. That is my information.

Q. And would not that fact and the prospect of the electric companies in the business have something to do with the value of stock?

A. I think it would.

Q. Referring to the fact that the Consolidated Gas Company's stock is quoted at 140 about, and paying 4 per cent., do you think it would sell at that price if its return were limited by law to 4 per cent. or there was not expectation of increase beyond that?

A. I think it is very doubtful indeed. I should not think it would.

By Mr. **Page**:

Q. The first information as to the fact that the Consolidated Gas Company owned the electric light companies came as the result of revelations before the Senate Committee in 1905, did it not?

Mr. **Mathewson**: Is that important?

Mr. **Page**: Yes, I think it is.

A. I don't know. I have known it for some time.

Mr. **Mathewson**: Everybody knew it for years.

2082 The **Witness**: I don't know when I first learned it.

Mr. **Page**: You tried to conceal it.

Mr. **Mathewson**: No, that is not true. Everybody knew it, it was common knowledge.

Mr. **Page**: The only point I was thinking of was that the stock sold at 220 or thereabouts long before it was known that the Consolidated Gas Company controlled the other lighting companies of the city.

Mr. **Mathewson**: That is not a fact. It was known years before the investigation, and the investigation didn't disclose anything except the exact amount which was held by the Consolidated Gas Company.

The **Master**: You need not waste any time about that.

By Mr. **Kirby**:

Q. You stated that if the City of New York had by reason of its large consumption per capita given a value to the properties of the gas companies, that you would take it that the future values were not apt to be as great as the present by reason of the conclusion that the consumption had about reached its limit. If you add to that the fact that there is a large yearly increase in the population of the city, would that in any way change your conclusion?

A. I beg your pardon, I did not state or did not mean to state that the fact that there was a large consumption here would make the value less in the future than it is at present. I simply acquiesced in the suggestion—and stated as my own conclusion that the fact that there was a large consumption per capita would not show such an opportunity for increase as a place where the gas 2083 business had not been fully developed and there was a small consumption per capita.

Q. But you would modify that conclusion if it was brought to your attention that there was also a large increase per year in population?

A. That is another element entirely.

Q. And that element you would take into consideration.

A. Yes, I would take it into consideration.

After Recess.

ALEXANDER C. HUMPHREYS resumed.

Cross-examination by Mr. PAGE:

Q. Mr. Humphreys, I believe you testified that your firm had been in the past engaged in the business of erecting water gas plants?

A. It is now very largely engaged.

Q. But not in this country?

A. We do not erect water gas plants in this country at present, no.

Q. In regard to the pressure provision of the laws of the State of New York, that the pressure should not in the service mains exceed 2½ inches nor be less than one inch, you state that that is practically impossible of enforcement?

A. I do.

Q. Will you state why?

A. Yes, sir. The variation in pressure necessarily due to variation in demands by the consumer in a city situated as is New York would make it impossible to comply with those restrictions, and at the same time furnish the consumers with a sufficient pressure to properly operate the appliances in ordinary use. If you like, I will give some examples, because I honestly believe that the law never would have been passed had the subject been understood. 2084 We will take, for instance, even getting down to as gross a variation as the hourly output, whereas we have got really to consider the variations per moment, because it is only in a moment that the pressure gauge is observed, the output of the Consolidated Gas Company hourly for the minimum hour for the minimum day is about 450,000 feet. The maximum hourly output for the maximum day would be 8,150,000 feet. To show what that variation that I have just referred to brings into the problem, if we were delivering all the gas through a single 48-inch pipe, which I do not claim but am simply using as an illustration, the total variation in pressure which is allowed under the law irrespective of any difference of level would in the case of a 48-inch pipe, that total variation of 1½ inches would be absorbed while that amount of gas, while the 8,150,000 feet, is passing through forty-eight feet of pipe 48 inches in diameter; whereas in the minimum case it would not be absorbed until it passed something over 15,000 feet, three miles. That serves as an illustration to show how the variations in output makes a demand upon the pressure regulation which is far beyond, in my belief, anything that even the ordinary engineer conceives of—I would not like to say that, I would like to take that out, as it might sound egotistical; but I mean that ordinarily the engineer does not conceive of, until he gets to studying the question in detail.

Q. Your illustration uses a 48-inch pipe to deliver the entire amount of gas?

A. Yes, sir, just as an example.

Q. And presupposes, does it not, that the pressure at the holder or at the station governor remains the same, remains stationary?

A. No, sir, it does not presuppose anything of the kind. It is absorption of pressure and that is where people go astray. It is actual absorption of pressure which is known in engineering as difference of head.

2085 Q. Well, you stated that the pressure would be absorbed under the maximum condition in 48 feet?

A. That is right, the passage through 48 feet.

Q. You mean that the resistance in the pipe would cause that loss of pressure in 48 feet, the friction?

A. I mean this, that the flow of gas through a main has been put in the form of a formula which is practically correct, which I can state if you wish me to state it.

Q. I wish you would.

A. All right. I will refresh my memory if I am not correct, but I think that is simple enough for me to remember, with a very poor memory; that the quantity will equal a constant multiplied into the square root of the diameter to the fifth power, multiplied again by the difference of pressure, (not the pressure as it is ordinarily stated, which misleads so many people,) and divided (all under the radical,) by the length of main and the specific gravity.

Q. It is a constant multiplied by the square root of the diameter——?

A. The diameter to the fifth power, and that again multiplied into the difference of pressure, that is p-sub 1 minus p-sub 2. That will illustrate it.

By Mr. Mathewson:

Q. Is that all under the radical?

A. Yes.

By Mr. Page:

Q. Do you mean that, p-sub 1?

A. P-sub 1 representing the initial pressure taken at any point you like, and p-sub 2 representing the pressure after it is delivered; in other words, p-sub 1 minus p-sub 2 represents the absorption of pressure, and that again is divided under the radical by the length of main and the specific gravity. Now the quantity is in cubic feet and the constant, I will give you its range, if you like.
2086 The pressure is given in inches of water, the diameter in inches, the length in yards, and the specific gravity with relation to 1 for air.

Q. Upon this formula there have been prepared tables, have there not?

A. Yes, sir, more or less accurate.

Q. Then in applying this formula, as I understand, you arrive at the result in delivering the maximum amount of gas which you have specified in 48 feet of pipe, the initial pressure of two and one-half inches would be absorbed below one inch?

A. Reduced to one inch.

Q. Reduced to one inch?

A. An absorption of an inch and a half in pressure.

Q. And if it is extended over 795 miles of mains, your initial pressure would have to be something enormous, would it not?

A. Enormous in any such case as that, yes.

Q. Well, the Consolidated Gas Company has 795 miles of mains, I think we have got that correct now, and all interlocked. To deliver the gas at the end of the system, what would have to be your initial pressure?

A. We would have to take into account all the initial pressures you have started with, all the sizes of pipes you are working on, a complication which no man living or that ever will live can figure out in advance.

Q. And which no formula could be used for?

A. No, but this formula serves as an example to show that this absorption of pressure is taking place all the time and to an extent which is not even appreciated ordinarily by engineers who are working on it.

Q. And by reason of that very fact does not a good gas engineer place his works at the lowest point possible in order to overcome by the levity of the gas somewhat this loss of pressure?

A. Unquestionably, the engineer who understands his
2087 business gets his works at the lowest point and would hope to have all the points of delivery uniformly higher.

Q. If on your pipe there are at regular intervals take-off- for supplying customers with gas, that goes to the reduction, doesn't it, of the pressure?

A. Yes.

Q. And if in this 48 feet of pipe you had services, that gas would flow to a greater distance under the same pressure, would it not, that is the pressure would not be absorbed in so short a distance?

A. Say that again, please.

Q. (Question read by stenographer.)

A. It would depend on the amount of gas, which amount taken separately flowing through that pipe, and the addition of all the amounts absorbed to each different consumer, would be the total absorption.

Q. Well, you would not figure that it would be necessary to multiply the number of feet by one and one-half inches to ascertain the pressure in any given distance, would you?

A. Certainly not.

Q. What?

A. It does not enter into it that I can see.

Q. If your 1½ inches are absorbed in the first 48 feet, to send the gas another 48 feet you would have to have three inches pressure?

A. Certainly.

Q. That is what I mean.

A. Certainly.

Q. And to send it 144 feet you would have to have 4 inches pressure?

A. In proportion.

Q. And then to send your gas through a mile of main, under your theory, how many feet of pressure would you have to have at the station governor?

A. I should have to figure that out, sir. Now, you are going on to a different problem.

Q. No, I think it is the same problem.

A. It is not, sir.

Q. I think it is the same problem extended, probably?

A. Oh, no, it is a different problem entirely. Now will you repeat that question?

2088 Q. (Repeated as follows:) And then to send your gas through a mile of main under your theory how many feet of pressure would you have to have at the station governors? That is to produce at the end of a mile of mains, I mean, a maximum of one inch pressure?

A. It will take some time to solve it. It does not follow from what I have said at all.

Q. Well I make it 13 pounds pressure, Doctor.

A. I will tell you in a minute. It would take almost 164 inches for one mile.

Q. Well, is that correct?

A. 163 inches.

Q. Is that correct, that it would take less pressure, initial pressure, to deliver gas at the end of a mile of main?

A. I am not talking about initial pressure. I am talking about absorption of pressure. You can take your initial pressure as you please within reasonable limits.

Q. This 163 or 164 inches is supposed to be the initial pressure required to deliver gas?

A. It is not at all, sir.

Q. (Continuing:) At the end of a main a mile long, at one inch pressure there?

A. It is not.

Q. That was the question.

A. Well, we will put it in that shape.

Q. Well, what is this you have given?

A. That is the absorption of pressure; the difference of head.

Q. Well, if in a mile of main you absorbed 163 inches, you have got to have 163——

A. What was the original question?

Q. If an inch and a half of pressure is absorbed in every 48 feet of pipe, what would be the initial pressure required to deliver gas at one-inch pressure through a main a mile long?

Mr. Mathewson: So it would be one-inch pressure at the end of the main.

Mr. Page: Yes.

2089 A. It would be two and one-half inches. You would absorb an inch and a half and have an inch when you got through.

Q. That is in the mile you would absorb an inch?

A. No, wait a minute. 164.6 instead of 163.

Q. Well, that would be the initial pressure required, would it?

A. Yes, and you would start with 164.6 and absorb on the way 163.6. You would have one inch at the end.

Q. Would it make any difference whether the main was straight or whether it turned corners?

A. That is all worked on the basis of a straight pipe, in rough numbers, and sufficiently accurate for our engineering work, that each right-angle turn would take about 1/42 of an inch in addition.

Q. And that assumes that at the end of the pipe the pipe is open, that there is no obstruction there? That is, that there is where the take-off is to the customer?

A. It is not necessarily open, no; simply that the gas has an opportunity to pass beyond, so the absorption is stated up to that point. It is loss of pressure on the way. It is due simply to the passage through that pipe.

Q. Now if you have along that line of a mile of pipe, at regular intervals, service pipes that go to consumers and there is drawing off of gas at those pipes, does it require an increase of pressure or would that reduce the requirements of pressure?

A. Reduce. You have then simply the sums of absorption and the volumes would decrease as you went along.

Q. Now, if your pipe is on a gradual upward rise of, we will say 10 feet to each 700 feet of pipe, how much would that aid you and reduce the pressure required?

A. The amount it would aid you for a particular part of the——

Q. Make it 10 feet to a thousand?

A. It would depend upon the specific gravity of the gas,
2090 and I would like to state here, which I should have done in
the first place, that my original case was taken on a specific gravity of 65, which I thought would be a fair average for New York City. The lighter the gas the greater would be the difference. For instance, with a coal gas of a specific gravity of 45, the difference would be very much greater. As the gas gets lighter the differ-

ence is greater of course. Now you want to know for a thousand feet?

Q. Take the gas as delivered by the Consolidated Gas Company in the City of New York?

A. A thousand feet with a 65 specific gravity—of course I have to assume the figure—and that will vary unquestionably in the City of New York according to the mixtures—even with the same candle power it will vary. The difference in pressure in a thousand feet, due to the rise in elevation, will be 5.17 inches. There will be the same fall of pressure and the same loss of pressure in descending to another level if the ground happens to be broken up into uneven altitudes rather than a steady rise, or in plateaus. No matter what the conditions are, the element of variation will be introduced to that extent; either rising or falling that element will be introduced, irrespective of all other elements.

Q. Then as against this absorption of pressure in the pipes that you assume we have possibly the rise in elevation to help overcome it; and we have next the fact that in the City of New York at regular intervals services are in operation that would very much reduce the pressure, and then also where you have an interlocked system as you have here with the feeding in from other mains?

A. Unquestionably we could not get along without it, could not satisfy the consumers.

2091 Q. If there is an automatic governor, would that not work instantly upon the increase in consumption, reducing the pressure in the pipe?

A. I shall have to expand that question a little more, Senator.

Q. If you will expand it, as you like to have it, you may.

A. Yes, I will interpret it for you, and then if I am not right you can go at it again. What is the question?

The STENOGRAPHER (reading): If there is an automatic governor, would that not work instantly upon the increase in consumption, reducing the pressure in the pipe?

A. It would entirely depend upon the character of the automatic governor. I will try and tell you just what you want to know. The automatic governor will simply regulate the initial pressure, I mean it will regulate the pressure at the outlet at that particular governor and not an inch beyond. If the governor is set to give a certain pressure, it will give it at that point, whether the pressure varies at the inlet to the governor or not, as long as it is in excess of the initial pressure desired. Now, the problem that you have in mind is probably in connection with the working of a volumetric governor. You can so regulate that governor or have that governor so designed that as the pressure decreases it not only raises the pressure, but acts to put on weights to increase the pressure, but the result will be right at that initial point, namely the riblet of the governor.

In other words, the governor wouldn't do any more than a man can do with a valve in his hands with instructions to do so and so if certain things happened.

Q. But it will do that and do it instantaneously?

A. Yes, sir, if it is a first class governor, in good working order, which many of them are not.

Mr. **Page**: I think I will have to move to strike out that
2092 last part. I think it hardly a fair characterization. There
is no question but what you will find a great many machines
of any description that are not in first class condition.

The **Master**: Strike it out.

Q. Would it be possible, Doctor, to run a trunk main for a considerable distance and bring that into a service main—excuse me, a distributing main, and thereby increase the pressure beyond the point of the junction of the two?

A. Undoubtedly.

Q. By "boosting," as we might say.

A. We know it can be done because it is being done very largely in New York.

Q. So that is one way of overcoming the inequality of pressure?

A. That is one way of overcoming it.

Q. And maintaining an equal pressure?

A. No, sir; cannot possibly maintain it equally under any circumstances.

Q. Wait a minute. Maintain a more equal pressure?

A. That is one of the methods followed to maintain a more equal pressure and avoid greater variation and it is being done in New York to-day.

Q. Now, furthermore, it would be perfectly practical in the matter of gas engineering, wouldn't it, to have district governors which would regulate the pressure over quite a large area?

A. Not unless those districts are separated from each other. If you are going to have a district governor on a certain set of pipes, those pipes must be separated, if you are going to depend on that governor.

Q. And it is quite possible, isn't it, and practical, to isolate one section from another and to regulate the pressure in that section by means of a district governor?

A. Not in New York, sir. Decidedly unpractical as an
2093 engineering proposition. I don't know of any city in the
United States that I have examined where it would be harder.

Q. Where it would be harder?

A. Yes, sir. Where it would give less results. I can explain that if you like.

Q. I would like to hear an explanation of that?

A. With the variations of level in New York as we now have to consider, the minute you commence to use district governors, you have to take in the change of pressure due to altitude and that is the primary reason for their introduction. In New York we have variation of level of about 250 feet. That variation is not, as in most of these cases where these governors are used, confined to certain districts of certain elevation, but the elevation varies very widely in the whole upper part of New York; and if we started out to do anything of that kind we should have to first decide what we would expect in a district to limit our variation to, as far as altitude is concerned, in each district. Suppose we should separate the mains of New York on the basis of having a variation due to altitude even of .24 or say

¼ of an inch, we should have to establish six different sets of mains; one set would run from the Battery to the Ship Canal to take in all the points of the first elevation, within the first 40 feet. We should then have to run another set from Canal and Bowery to Broadway and 34th Street, and so on up to the Ship Canal, because from the Ship Canal a short distance towards the Battery all levels are involved. In other words, you have the level of one foot, say, at the Ship Canal, or five if you prefer to put it so, and you have the ultimate maximum levels all involved within a very short distance of the upper part of the Island, so you would have to run almost up to the Ship Canal to take in that set of mains. The third set would be from 59th Street and Columbus Avenue and so on up on the 2094 West Side, nearly to the Ship Canal, almost to it. The fourth set you would run from the West Side of 116th Street and Amsterdam Avenue up nearly to the Ship Canal again. The fifth set from 165th Street to the Ship Canal nearly, and the sixth set from 173d Street nearly to the Ship Canal. In other words, you would have to have six distinct sets of mains, and the capital burden would be very much increased, and having put these different sets of mains in you would not then be able to supply your consumers with the pressure needed for their appliances and still keep within the law.

Q. Are you familiar with Butte, Montana?

A. No, sir, I am not.

Q. Do you consider that the city of New York is the most hilly city in the United States?

A. No, sir.

Q. Do you consider that the changes of altitude in the city of New York are greater than they are in any other city in the United States?

A. No.

Q. Outside of the territory extending from 110th Street west of Morningside Avenue, running from there on up St. Nicholas and Edgecomb Avenue, are there any substantial altitudes which you would have to meet, where gas has to be delivered?

A. Take the case of the very thickly settled district around 125th Street and Amsterdam Avenue: You have a range of five blocks with a change of level of 75 feet, and we go on four blocks more and the range is increased 38 feet more.

Q. Well, within the range of five blocks of 125th Street which way, or is it both ways?

A. At 125th Street we have a level of about 25 feet at Amsterdam Avenue; at 120th Street a level of 100 feet and at 116th Street a level of 138 feet, but that is not the worst of it; it is a question of hollows and knolls. You go north again from 125th St. to 135th Street and you have got 129 feet again, and at 138th Street only three blocks further we have got 148 feet. In the distance 2095 between the Ship Canal and 183rd Street we have got a difference of 251 feet. Now, it is not that we cannot control pressure due to the elevation in a district; it is due to the fact that those differences of level are scattered all over. You would have to run to a starting point here with a pipe and cover the same district with another pipe.

Q. You know that at the upper end of Manhattan Island the Ship Canal ends practically in a bluff?

A. I am referring to streets. You take Broadway, and we find at 218th Street, just away from the Ship Canal, it has risen from five feet to 25 feet; and at 211th Street it has fallen to 18.75 feet; at Dykeman Street it has risen again to 20.67; a short distance beyond that it is 37.50; at 183rd Street it has risen to 251 feet again. In other words, it is ups and downs. I have used district governors with very great success and very great satisfaction to myself and——

Q. (Interrupting.) Well, now, outside of this territory which is practically the territory that I mentioned in my questions to you, outside of that territory, isn't the City of New York an ideal city for the delivery of gas, and no better?

A. I should not call it ideal, but as far as the elevation is concerned, it is not more difficult from any other city, but—well, the real trouble commences about 59th Street, for even there we have a variation, ups and downs, from one foot up to 76 feet, and a very great variation according to whether you go west or east. For instance, we have at Fourth Avenue and 34th Street 61 feet, whereas at First Avenue and the same street it is only seven feet. In other words, there is no regularity as to change of level. That is where district governors are not useful.

2096 Q. Feeding from a main carried up on the east side, your elevation toward the center of the island would help, wouldn't it, in regulating your pressure?

A. Unquestionably, no.

Q. Because the pressure of gas would help overcome the absorption of pressure?

A. Unquestionably no. Any variation as to altitude simply introduces an element of variation beyond our control. Where we gain in one point we must lose in another if there is a fall. And in New York we have those decreases in altitude as well as increases. It is not a question of pressure. We can get all the pressure we want, by simply putting on the pressure at the works, and that is the way we would run the works if we could, by putting on the necessary pressure; but it is not a question of gain of pressure; it is a question of reduction of variation of pressure, and that is where we cannot control the question. The laws of nature are against it.

Q. Does the company employ district governors on these bumps and knolls and ups and downs?

A. I think not.

Q. Well, while the company can get undoubtedly all the pressure that it wants in the pipes, does not the excessive pressure operate to the detriment of the consumer?

A. What would you call excessive pressure, for me to answer the question? Anything above 2½ inches.

Q. At what point of pressure do you get the best results from a flat flame burner, 22 candle-power gas?

A. You still have not gone far enough. If you will designate the burner I might happen to remember for that particular burner and I may not. I will do the best I can to remember it.

Q. I mean the burners that are in common use, not the burners that are adjusted to pressure, which are not in common use but are used by scientists?

A. You will have to go still farther, Senator. There are a great
many flat flame burners in use, and you will find engineers
2097 disagreeing as to which is the best, and they require different
pressures. Not to quibble, I will say that you can get a first
rate result with many kinds of flat flame burners with seven-tenths of an inch, and if we had nothing but flat flame burners to take account of, flat flames and Argands, the problem would be simple as to the maximum pressure to be used, and also the variation within the house.

Q. You produce the best results from an ordinary flat flame burner at seven-tenths of an inch pressure?

A. No, I did not say all of them; I said with some of them.

Q. What I am referring to is the ordinary burner in use in the City of New York, the kind that the Consolidated Gas Company distributed to its customers at one time out of its generosity. You are familiar with them, are you not?

A. I do not remember which particular burner that was. I suppose that some of the gentlemen here can tell me. That kind would vary, as I think has been indicated, as to candle-power.

Q. Well, take 22 candle-power.

A. All right, then we will define it as 22 candle-power. Then they will vary again as to the diluents of the gas. In other words, gases that do not make candle-power but which go to dilute it. According to the make-up of the gas, so will the pressure most desirable for a particular flat flame burner vary, but in round figures I can say that seven-tenths of an inch ought to be a pretty satisfactory pressure to give good results. If I were making photometrical measurements in my laboratory I should not take anybody's word for anything of that kind, but I would determine that from my own observation, as I have done repeatedly, and proved the tables to be wrong in many instances, in my individual work.

Q. Now, as the pressure increases on that same burner with
2098 the same quality of gas, the consumption increases, does it
not? That is, if a burner at seven-tenths of an inch pressure
burns five feet of gas, and you increase that pressure by an inch, it would burn much more gas, wouldn't it?

A. Yes, if unchecked.

Q. And if at seven-tenths of an inch it produces 22 candle-power of light, how much will it produce with the additional inch pressure?

A. That I would not generalize, sir, it would depend on the burner. For instance, many of these flat flame burners have what are known as checks in them, and those require a larger initial pressure, a greater initial pressure, because the burner is made——

Q. (Interrupting.) I am not referring to the Gray check burner; I am referring to the ordinary burner that is used, the one we have taken at seven-tenths of an inch.

A. Yes, but you have not gone far enough. You see I am talking about something that I know something about. Those ordinary burners that you speak of are very apt to have those checks in them. I am not speaking of governors, I am speaking of the ordinary fixed check, and many of those burners are actually designed with the checks in them and work under a certain pressure, so that the checks will take the swirl out of the gas so that it will come to the burner with an even delivery, and it needs a higher pressure for that kind of burner than it would for a burner without the check.

Q. I do not want the burners that are particularly regulated to keep down consumption, but the burner as ordinarily used by the consumer.

The Master: The common people?

Mr. Page: Yes, the common people, the plain people.

Mr. Mathewson: Those are the burners which we deliver, 2099 with checks largely. You wanted him to testify in regard to the burners that the Gas Company delivers.

A. I am not talking about laboratory results. Unless I am talking to a gas engineer I forget my laboratory unless for a particular purpose. I am talking about the burners that are being used, and there are more check burners used in the world to-day than there are unchecked, a good deal.

Q. And as the people come to understand the subject a good deal better, more of them will be used, won't they?

A. I tried to educate them up to that in my companies thirty-three years ago, and I think all the gas companies in the United States are trying to do it, issuing pamphlets showing the flames produced by flat flame burners under varying conditions, educational pamphlets that they are distributing, showing them how to save gas themselves, with the flat flame burner.

Q. We will disregard the Bray burners and the check burners and the anti-swirl burners, and come down to the burner used by the plain people, and which under seven-tenths of an inch, 22 candle-power, will produce the best results. Now, if you take that burner and increase your pressure by an inch, what would be the result on the illuminating quality of the gas?

A. Let me say first of all that we cannot disregard the swirl burners and all those things and come back to the burners used by the ordinary people, because I am talking about the burners used by the ordinary people. As I have said repeatedly, and I am not trying to quibble about any extraordinary burner, if you have a seven-tenths pressure on a burner and increase it an inch the effect would be to reduce the candle-power probably and the amount could not possibly be told until you took that particular burner and the particular gas to determine it by experiment.

2100 Q. But you have been for thirty odd years considering this subject, haven't you?

A. Yes.

Q. And you must in that time have made a number of tests and observations on this very point?

A. I have, but not any such indefinite and general point as you have given. If you will give me a certain burner, and define it and give me a certain gas, put your question to me and give me a few hours, I will tell you what that particular burner will do, but when you generalize, as they do in such books as Newbigging and Hunt, &c., and say that such and such things do such and such things under such and such conditions, I can prove those tables to be absolutely wrong, and I have done so.

Q. Newbigging says that the greater the pressure the greater the consumption of gas. You will agree with him that far?

A. Certainly.

Q. Well, we will see if we cannot get on some general ground of agreement without adjourning the case for a test in the laboratory. As a general proposition, after you have increased your pressure above the point of greatest efficiency, you consume more gas?

A. For that particular burner.

Q. For that particular burner; you increase the consumption of gas and decrease its illuminating power, candle-power?

A. If you have been able to arrive at a specific point where you know you have got a maximum, as a rule there is a short range where you cannot detect the difference. But, going beyond that range, if you increase your pressure, you decrease your candle-power per foot. Of course that pressure can be regulated at the cock, and must be regulated at the cock by the consumer, for he has other appliances at the house which will need from 1½ inches to 2 inches to give him a result.

2101 Q. Now, we will come to that. Rapid variations of pressure are detrimental to the consumer, are they not? That is, he can adjust his cock of the burner to meet the pressure at one time, and then if the pressure is changed very suddenly within a very short time——

A. (Interrupting.) He would have to adjust it again.

Q. He would have to adjust it again?

A. Yes, and it would be an inconvenience and make a fellow mad. It would me, I know.

Q. And probably under the ranges of pressure that existed in the City of New York before our Gas Investigation, he would have to lead somewhat of a strenuous life running around to his burners to regulate his pressure and keep in touch with the frequent changes of pressure of the Company, wouldn't he?

A. That I could not say, because I am not aware that there are such variations. I am fairly familiar with New York conditions, and have been so for many years, and I have always supposed that the pressure in New York was excellently attended to.

Q. Three inches in an hour would be a rapid variation in pressure?

A. That would be a rather rapid change, yes, sir.

Q. The important point in regard to pressure, as far as it relates to the consumer, is that he should have the gas delivered to him at somewhere near equal pressure, is it not, if there -s to be any regulation on behalf of the consumer?

A. The desirable thing is to avoid variation of pressure.

Q. And the closer you can limit the range of pressure, why, the more advantageous it is to the consumer?

A. That is right.

Q. The object of the regulation of pressure being for the benefit of the consumer, the nearer the pressure can be kept at an equal flow to the consumer's apparatus, the better and more effective it
2102 is, is that so?

A. For both consumer and gas company, yes, sir.

Q. Now, you say that there is no such thing known in gas engineering science as a service main?

A. I never heard of it. Oh, yes, I have heard of it since the Stevens Committee—born of ignorance.

Q. That was the child of ignorance?

A. Fathered by misinformation.

Q. And born of the legislature?

A. Yes.

Q. That being the case, Doctor, it is the duty and prerogative of the Court to correct such errors as legislatures fall into. Now, as a friend of the Court—the criticism that you make of that phrase is the joining of "service" and "main" is it?

A. Yes.

Q. If we strike off the "main" and substitute "pipe" making it "service pipe" that would neither shock your ideas of propriety nor very much impress you with the ignorance of the legislature, would it?

A. The ignorance has already shown itself. No, there is no shock about it, anyway, but when I read anything of that kind I like to understand what it means, so that I can comply with the law. When they say "service mains," I do not know what it means.

Q. We will eliminate the word "main" and leave "service" now, if it said "service"——

A. I should have understood instantly.

Q. You would have understood instantly?

A. Yes, the trouble was that they tried to join up two things which are entirely opposed to each other.

Q. Now Doctor, I understand that you also criticise the provisions in regard to ammonia and sulphur of the legislative regulation?

A. I do in this sense, that I think the penalties are extremely severe, and as far as I know, have never been heard of before outside of his city. The tendency in England, of course, is at present the other way, to remove the restrictions entirely on sulphur com-
2103 pounds and ammonia. The London companies do not have to stand any penalties either for ammonia or sulphur compounds. They are only tested for candle-power and sulphuretted hydrogen, as far as penalties are concerned. The tendencies are rather the other way, to liberalize than to put any such thousand dollar fines on them.

Q. Then, the thing you criticise is not so much that the provision should not require a pure gas and a better gas, but that the violation of it is visited with a heavy penalty?

A. Yes, for the reason that it would be almost beyond the range of possibility that companies should not at times fall within the limitations set by the law, even with all good management, and every desire to maintain the purity of their product.

Q. The Astoria Light, Heat & Power Company are constructing a plant for the recovery of cyanogen in connection with their production of coal gas. Would not that process absorb the sulphur very largely from the gas?

A. It would tend that way.

Q. And the more sulphur you have in the coal the more cyanogen you produce?

A. Not necessarily.

Q. You have given a valuation to this plant, Doctor, and you come to the conclusion that the book value of $16,080,000, odd, was about the right value, did you?

A. I came to the conclusion that it was not an over-statement of value, my inclination in the first place being that it was an under-statement.

Q. That is, you think it would be worth a little something more than that?

A. Yes.

Q. Do you understand that the book value as stated is the value at which the Consolidated Gas Company entered the plant on its book in 1884 with such additions as have been made since?

A. In a general way. Before replying to that specifically I
2104 should want to go over the books myself and see every entry
that had been made and see that that properly represented
the book value without any writing off to reduce the value.

Q. Well, we will assume, which is in the evidence, that there has been no depreciation written off on the plant, and that the plant account was opened by taking the various plants of the subsidiary companies at their inventoried value, and that the additions to it had been of actual money expended in expenses and in additions to the plant?

A. Yes.

Q. Now, assuming that to be the condition, and $16,080,000 the result, would you say that that plant was worth more to-day than that figure?

A. I should say as my very best judgment, and having confirmed it by recent examination through my assistants, that the cost to reproduce that plant in its present condition, taking into account the depreciation just as we find it, would be more than $16,087,000. I feel perfectly certain of it.

Q. That is, to reproduce the identical plant?

A. Yes.

Q. If you were going to build a gas plant to-day of that capacity, would you reproduce those particular plants?

A. Probably not, in every particular.

Q. Well, it is certainly not, is it not, that you would not reproduce the plants as they exist to-day?

A. Yes, I think it is practically certain.

Q. That is, it would not be an economical or efficient plant, or as economical and efficient plant as you could produce to-day?

A. Probably not quite as economical as you could produce, some parts of it, but the largest part I do not think could be improved upon as far as efficiency is concerned, and as far as economy is concerned.

Q. That is water gas?

A. Water gas.

2105 Q. Which has been entirely rebuilt within the last two years?

A. Not to my knowledge it has not.

Q. 1904, wasn't it?

Mr. Mathewson: No, there was a lot of water gas before that, there was a great deal of water gas before that; not all of the water gas stations have been rebuilt or replaced in the past two years.

Q. Well, would you replace the coal gas with water gas?

A. I do not think I should. I know I should not.

Q. You would replace that with more modern apparatus which would be of greater efficiency and more economically handled and operated, would you not?

A. There would be a question to decide, as to whether it would pay to carry a much heavier capitalization to get in regenerator benches and the like, or whether I should put in a new plant.

Q. That is what we are talking about; reproducing that plant new.

A. Reproducing that plant new; the only practical change, as far as the generation of gas is concerned, would be to put in regenerator benches, and there we have to balance up, in regard to the residuals and the like, as to whether it would pay to put in the amount of capitalization for the saving in operation. Sometimes it pays and sometimes not. Some of the best engineers think it does not pay to put those modern appliances in. It might be decided both ways, according to locality.

Q. Is there any engineer that you know of that would recommend the placing of a direct fire retort in preference to a regenerative retort?

A. Yes, I think there are quite a number of them. They say it is a question of how much capital you want to put into it; balance up the pros and cons. General judgment of course would be in favor of regenerator benches, all other things being equal.

2106 Q. As I understand, you have not been all over this plant, as was done by Mr. Mayer, with your assistants, and this result is not the result of a computation as to the different elements entering into the plant?

A. My original statement was based upon my previous general knowledge of the plants, some of which I was quite familiar with, reinforced by an examination of all of them personally. From my wide experience, especially my wide experience in examining plants for purchase, I made up my mind that the price on the books was a moderate one. Since then the plants have been examined by my assistants in every detail, have been examined, but the figures have not been entirely completed. As I said the other day, my chief assistant was called away by a sudden emergency and he is still away.

Q. How long a time was your assistant engaged in that work?

A. My chief assistant with two engineering assistants, two or three clerks and three or four accountants to help in figuring, were engaged night and day, practically Sundays and all, for about three weeks. And every important part of all the plants was examined.

Q. They took measurements, I suppose?

A. I presume they did. I have not had an opportunity to go over the work with them except to get this general statement from my chief engineer, which was sufficient to confirm me in my original belief.

Q. You do not mean to say that that plant is worth $16,080,000, do you?

A. I do.

Q. And would that be your testimony if it should appear that that plant cost a great deal less than that?

A. I would not care anything about it; if it cost 10 cents it would not affect my testimony a bit. I am taking the thing as I find it and judging it accordingly. What sort of bargains they may 2107 have been able to make in the past I don't know and don't care much about.

Q. Then if it should appear that this plant was built at less than $16,080,000 and a good deal of it had been in use for fifty-three years, you would consider it was more valuable to-day than when it was put in fifty-five years ago, would you?

A. I should not make any comparison that way. I don't know under what circumstances it was produced. I don't consider whether the plant has had money spent on it in the meantime. As I said, it would not affect my judgment at all. I take it as I find it.

Q. Then this plant as it exists to-day, having had money spent on it from year to year in the way of repairs and replacements, you consider to-day to be of the full value or more than the book value?

A. At least $300,000 more than the book value.

Q. Although it has been testified to by the company that nothing had been written off for final depreciation?

A. I don't know what they have testified, or I don't care what they testified.

Q. I am telling you what they have testified and ask you if you will take that into consideration?

A. I take it into consideration—or at least I do not consider it. I take the thing as I find it.

Q. If that is the condition of the plant, what is the necessity of establishing a fund for depreciation?

A. Now, we have got on a very different proposition.

Q. It is the same proposition from a different point of view?

A. No, sir, entirely different, if you will pardon me. No matter what has happened in the past or whether there may be appreciations in certain items which overcome depreciations, as conservative business men managing a large property of that kind or any property, we must acknowledge the self-evident proposition that the plant will eventually have to give up its day of usefulness, and 2108 the best we can do under those circumstances is to consider the plant separately and collectively and make up our minds in how many years, all things considered, that investment will have to be renewed. Then as conservative business men we must set aside each year and say that a certain per cent. of the value of that property must be set aside, and called part of the yearly cost as accruing depreciation. Now then if I come along later and find that certain things have happened and my estimate is wrong, I correct my estimate. But I have done the very best I can with all the knowledge I had in advance, to say what will be done in the future. For depreciation as a question of estimate for the future and the question of depreciation for a plant as submitted are two entirely different propositions.

Q. As I take it, you do not take the lamp of experience to guide your steps in the future?

A. We do not?

Q. I say you do not?

A. I do not take the lamp of experience to guide my steps in the future?

Q. Yes.

A. I certainly do.

Q. Here is a plant that has been in operation for a great many years and which has been kept up by repairs, and is worth more to-day than when it was produced.

Mr. Mathewson: Is that your testimony, Senator?

The Witness: I was going to say, I don't know that you know.

Q. I have asked you, assuming that that was so, assuming that that plant has been in operation, and you say you don't care how long it had been operating, you looked at its condition to-day, and if it was worth more to-day you so valued it and that it was 2109 worth $300,000 more than the book value?

A. If you will permit me, I don't think I said how long it had been operating, I said I would take it as I found it. I did say I should not care how many good bargains had been struck in the purchase of the property and its cost. I should take into consideration every element as an engineer in valuing that piece of property as to what I thought it would do in the future.

Q. From your investigation, did you not ascertain that parts of this plant had been in operation for a great many years?

A. Yes, sir.

Q. You did not take that fact into consideration?

A. Certainly. I also took into consideration the fact, apart from the years, what is its present condition.

Q. Certainly.

A. And in my depreciation, if you will permit me, my estimates on the depreciation, as I have tried to explain, I think, on the direct-examination, do not depend simply upon the case of exhaustion of life but upon my general experience as to how long we can depend, all things considered, as to when certain plants will be displaced, outside of the question of their actual usefulness as a piece of separatic apparatus at the time, but how long they will have to go before they will be displaced as a working unit.

Q. Displaced for what purpose?

A. Everything.

Q. For what reason?

A. Obsoletism, moving, because the city takes your property, because the city cuts your streets off and cuts you off from access to your water, and all sorts of the ordinary contingencies of business life. Street mains would be very largely affected on account of having to put in large mains for small mains, and the like.

Q. The taking by the city of your property is not a very serious depreciation, is it?

A. It depends on the price the city pays you for it.

2110 Q. From your experience, I suppose, the same as others, it is that the city generally pays a little more than it is worth?

A. No——

Mr. MATHEWSON: I object to it.

The WITNESS: I would like to answer it. I have had some experience.

Mr. MATHEWSON: All right, if you want to answer it I withdraw the objection.

The WITNESS: You have the evidence right here that property that has been taken is not paid for at all.

Q. The property taken is not paid for at all? Well, we will let it go at that.

Mr. BURR: The City of New York is still solvent?

The WITNESS: She may not be if she goes on.

Mr. MATHEWSON: You cannot prove it by the fact that they have paid their debts to us, either for plants or gas furnished.

Q. Do you anticipate that there will be any greater advances in the method of handling retorts in coal gas plants than there have been in the past, in the intermediate future?

A. Any greater?

Q. Yes.

A. I am not looking for any great advance in the gas making apparatus. I am looking for very great advances in the burning, in the appliances of gas, but not for any great advance in the gas making business, I am sorry to say.

Q. Therefore there will not be any very great requirement for supersession by reason of improvement?

A. My anticipation is not very great in that direction at present, no.

2111 Q. Therefore we have not got to take that element into consideration to any great extent?

A. Not as much as in the past, no.

Q. Is not the plant at 14th Street about the most antiquated type there is in use?

A. In New York?

Q. In the United States.

A. Oh, no.

Q. Well, what type is there that is more antiquated than the direct fire retort?

A. Direct fire benches of threes.

Q. Where are there any of those in use to-day, direct fire benches of three?

A. I cannot say from memory, but until very recently there was a very great number of them in St. Louis. I imagine they are torn out by this time. They got very good results from them, too.

Q. Is this theory of the necessity of a reserve for depreciation something new to gas science?

A. Reserve for depreciation?

Q. Yes.

A. You are not referring to the so-called reserve, are you? You mean the amount that I set aside for depreciation? Because you know the term "reserve" I have used in another sense, but you are referring to the depreciation?

Q. The depreciation?

A. No, I imagine it is as old as commercial life.

Q. It was well known in 1884, wasn't it?

A. Yes, though differently treated. In the older days the prices were higher and the profits were larger and the amount of money was constantly carried back into the business for renewals and for extensions, and they did not attempt to capitalize all those extensions. In that way they were sometimes unconsciously, as I have discovered in my examinations, taking care very fully of depreciation. Now, as time goes along and the price is reduced and limitations are put on the price, we have to figure very much more closely and see how much we can put aside and how much we will be allowed to
2112 be put aside, specially as they do not allow us to capitalize anything in excess.

Q. The way the Consolidated Gas Company has been financed is to make the necessary repairs and extensions out of its earnings, is it not?

Mr. Mathewson: Repairs and extensions?

Mr. Page: Repairs and renewals.

A. Repairs and replacements so-called as current renewals; current renewals, as distinguished from deferred and final renewals.

Q. Now, we will also go to the further item of extensions. Have they not been taken care of in the same way?

A. Out of their profits?

Q. Yes.

Mr. Mathewson: Does Dr. Humphreys have any information on that subject?

Mr. Page: If he has not he may say so.

A. I am trying to think if I have the information. Just at the moment I would not like to reply to it.

Q. That is the way you advocate, is it not, of using any reserve that you have for depreciation?

A. I advocate taking the reserve for depreciation and putting it back into the business, keeping very careful track of that reserve and how it is spent, so it cannot be considered as a warrant for extra capitalization. In other words, it is against the depreciation to the limits of my estimate.

Q. I may not understand your theory of depreciation, but your idea is that the fund should not be accumulated but should be carried into further extensions of plants?

A. My theory is this, Senator, that a certain amount of money should be set aside to care for depreciation accruing and which has not yet manifested itself by the breakdown of plants. Now the question is how shall we invest that money. If the business
2113 is lying dormant and is not extending and there is no use for further capital, then of course we will put it out to accumulate at compound interest and of course the day of the death of the business is coming. If we do not go ahead, we will go back very shortly. But if the business is active and there is use for capital to cover extension of business, I claim it is the wise policy to take that depreciation fund so far as it will go—you will probably require a good deal more, but so far as it will go—and use that depreciation fund not only for the current renewals and even the deferred renewals, but for the final renewals, to offset the final renewals and invest it in extensions so as not to draw in that extra capital which otherwise would be necessary for those extensions. In other words, if you put it into a sinking fund to accumulate at 4 per cent., all you get upon it is the 4 per cent., and that money is withdrawn from your business and it cannot be used except as the parts of the plant fall in. Now, I say if the business is active and you need that money and can make 4 per cent. or better on your extensions, and it would be very poor gas business if you could not—it is better to use that money instead of putting your money away at 4 per cent.

Q. I think I understand your theory. Now we will take that. At the end of forty years you have extended your plant to the value of the existing plant at the beginning of the forty years?

A. Yes—well, no, not quite. You will have taken care of your renewals as they come up and such surplus as you have will have gone into extensions. The Lord knows what that surplus would be, but you have to take care of your current renewals as they come up. You must bear in mind the plant does not exhaust itself in forty years. There is no such thing as the complete exhaustion of a plant at any one specified moment. The different parts of the
2114 plant are being exhausted from time to time, and the estimate I made up on the basis was that certain parts will go out in ten years, twenty years, thirty years or forty years. Now, if you are not ready to use the surplus from depreciation charges for exhausted part of the plant, at any particular moment, you have the opportunity to use it for extensions, and you put it into extensions. How much you will have in forty years, of course, is problematical.

Q. On those extensions you get an increased business?

A. Yes, and you need it.

Q. That goes on to your general earnings on gas sales?

A. Yes.

Q. Mingled with your other profits?

A. Yes.

Q. And at the end of that time, whenever that may be, that you say will arrive when you should need this plant to replace your original plant, your money has gone into extensions and the income derived from those extensions has gone into the ordinary income of the company, and if you have to replace your plant, would you not have to issue your new capital?

A. No, sir.

Q. Where are you going to get your money from to build your new plant, or old plant?

A. So far as you had used that money in advance for extensions, in lieu of depreciation, you would have to put out capital at that later day rather than at the earlier day. You would have saved yourself capital charges in the meantime. Now, the difference is this, you will in the meantime have earned on the money so reinvested in the business, and those additional earnings you need to pay the difference between what Mr. Bemis would calculate as the right amount for 40 years and the amount I would calculate. He would calculate only 1.05 per cent. and I would calculate 2.5 per cent. Now, those increased earnings would be the amount required at 4 per cent. to pay the difference between those two, and the
2115 burden so far as capital and all is concerned is exactly the same, provided I can make the 4 per cent. in my business. If I happen to earn a little better than 4 per cent., I have the advantage. In other words, it is less of a burden upon the business to put that depreciation cost back into the business than it is to put it out to somebody who will only give 4 per cent. For instance, if I have——

Q. But haven't you testified that in the meantime you have distributed your earnings on your extensions to the stockholders instead of preserving it to use in the rebuilding of the plant?

A. No, indeed, I have not. It has been absolutely held intact by the fact that I have put it back in the plant, which must be kept against depreciation, it does not go to the stockholders at all.

Q. I am speaking about the earnings.

A. The earnings are involved in that 2½ per cent. I could take and cover my depreciation by putting in a certain fund 1.05 per cent., if I placed it out of my own hands and did not retain it for use in my business between the 1.05% and 2½%. If I take all that money and reinvest it, the difference is covered by the earnings I get back at 4 per cent. from amounts taken out to cover depreciation and reinvested in plant, it does not go to the stockholders at all. For instance, if I set up a fund——

Q. But you are putting it into extensions, so at the end of this time you have a larger plant and you may have reproduced a plant that was the same value of your original plant, but you have nothing back to take care of your original plant which has given out?

A. We will take a simple case and say that there is no necessity for renewals in the meantime and that the plant ceases to exist at the end of 40 years and goes out of existence at once. In the mean-

time I have taken my 2½ per cent., which multiplied by 40 is 100,
and at the end of 40 years I have reproduced that much more
2116 property, and my original plant goes out. I have got the
100 per cent. for the old 100 per cent. Now I have got to go out, instead of taking the old capital at the end of 40 years, I get my capital——

Q. It is just a difference of time when you would get the capital?

A. Yes, a difference of 40 years, an average, say of 20 years.

Q. And it is in the difference in the cost of gas of one per cent., isn't it?

A. No difference at all, it does not affect the cost of gas.

Q. It is more than that. You said you take two and one-half per cent., and putting out the same money at compound interest to produce the same result, it would take 1.5?

A. Exactly. And if I put 1.5 out I would lose the use of my money from the start and have to bring in capital to do the very same thing and pay the interest. The burden is the same on the business.

Q. But you are making the consumer to-day bear the burden of the needs of the future consumer?

A. No.

Q. That is if you capitalize your extensions to-day, you do not place the burden of those extensions upon the consumer of to-day, but under your theory you are making the consumer of to-day pay for the extensions of the plant and the capitalization at the end of 40 years, you make the consumer of to-day bear that burden and the consumers along during that 40 years bear the burden, don't you?

A. To a very slight extent in the first few years.

Mr. Page: I see that the Master does not agree. It seems to me——

The Master: I do not see why the consumer does not have to pay the money that goes into your sinking fund.

Mr. Page: He does, but it is 1.5 instead of 2.5.

2117 The Master: It is 1.05 to him to-day and the two and
one-half is something to posterity that does not concern him.

Mr. Page: No, it comes out of his pocket to-day, it is a difference of 1.05 on the consumer of to-day.

The Witness: Oh, no, sir.

The Master: It does not seem that way to me.

The Witness: You have taken that additional amount and put it out, getting additional earnings, but you would have to bring in capital to do it, if you did not. If you take this money and put it out, you have to bring in more capital to do this work, the extensions will have to be made, whether you take it from one or the other. If you take it as new capital, and bring it in, the customers are going to have to pay for it. Nobody else will unless we have some more red journalism.

By Mr. Mathewson:

Q. You get revenue from the extension which you produce by taking the 2½ per cent. that if you did use it, would go towards paying dividends, if you did pay dividends on original capital, wouldn't it?

A. Yes.

Q. And thereby it would come to the benefit of the consumer?

A. The burden of capital is exactly the same on the business, and on the company, provided always that it is both on a four per cent. basis that we figure. Of course there is an advantage to the company, and there it is good business to do it, because they probably earn more than 4 per cent. The first year they may not earn
2118 over two. I have put in many extensions where I didn't get
2 per cent. the first year, but it gets better as it goes on.

By Mr. PAGE:

Q. Why did you assume 40 years as the life of a gas plant?

A. Of a gas plant, I do not. I take each case as I find it.

Q. Well, you think a reserve should be made of 2½ per cent. on this gas plant?

A. Yes.

Q. On what do you base that?

A. On my general experience and very wide experience in such matters and after viewing the plant. And taking everything into consideration, so far as I can, I thought that is just as far a limit as I can go. Other minds materially differ with me on that. Professor Marx, for instance, thinks it should be 5 per cent., which makes it 20 years for final renewal. Professor Bemis thinks it should be 33 years, which is seven years shorter, but I prefer to be a little more conservative and I think I am safe in saying that forty years is all right, as it is the result of my experience.

Q. We have the plant of the Consolidated Gas Company which has been in operation, some portions of it, for 53 years, and Mr. Mayer has made a very careful examination and the greatest depreciation that he found in any part of that plant from an absolutely new plant to-day was 15 per cent. Does that affect your estimate at all?

Mr. MATHEWSON: Let me correct you, he found much more than that in some cases. In some cases as high as 25 per cent., and in one holder house he found 50 per cent.

Q. Well, we will eliminate the holder house, but we will take the machinery and the apparatus for gas making and the highest percentage of depreciation he found was 15 per cent., and from that to
5 per cent., and in some cases he found none. Now, in the
2119 light of that experience, what period of time are you going
to place for the final depreciation of that plant?

A. I should not base my judgment upon Mr. Mayer's work any more than I base my opinions upon text books, if I think I know more about it than the text books, if I think I know more about it than the next books. Now Mr. Mayer has made certain statements, I don't know what they are or how he has figured it. I should want to go over the whole question with him and see whether he figured at it as I do before I express any opinion. I should say that my judgment of forty years is a very conservative estimate for ultimate renewals, what I call final renewals of plants, and I think it would be so considered if you put fifty men here on the stand that had experience.

Q. If you put a cast-iron main down in the streets of New York it will last how long?

A. If you put a cast-iron main down in certain streets in New York and do not connect it up and do not regard it as a gas delivery main at all, so you will not have to consider whether it will have to be removed or not, and simply consider the question of the oxidization of iron, I am not prepared to say how long, but I should be almost willing to guarantee it for 100 years. All that I took into consideration in making my estimate.

Q. It has been testified that mains are in the streets of New York that were placed there seventy-five years ago, and were connected up and have been operated ever since and show no depreciation?

A. I don't know whether it has been testified or not.

Q. Well, Mr. Simpson so testified.

A. All right. I also happen to know that in New York the amount that I have set in advance without knowing anything about these facts for depreciation of the distribution system came out, I think, within .04 of 1 per cent. of what they have actually expended in keeping the mains up in the whole distribution
2120 system. In other words, they have been ahead of accruing depreciation.

Q. Well, then you would take 100 years as the life of the mains?

A. No, I do not. I say I would be willing almost to guarantee it for that. That entered into the matter so little it makes no difference.

Q. I understood you, Doctor, to say that was the figure you took in your calculation?

A. No, I did not.

Q. Excuse me, that was my mistake. Now we will take a gas holder.

A. A gas holder?

Q. Yes. What is the life of a gas holder?

A. The life of a gas holder altogether depends upon how it is built, the locality, the chances of its having to be replaced and chances of needing a larger holder and the like. I place no general life limit upon any piece of property, never have so testified and never will. Each case must be considered by itself.

Q. Well, take gas holders complete, built as they are in the City of New York and kept well painted on the outside. Is there any period of life we can place on the gas holders?

A. I would place different life on the different holders according to how they were constructed; there is a very wide difference in the gas holders of New York as to their method of construction, etc.

Q. But for depreciation, actual wear and tear, is it possible to set any limit?

A. Upon what?

Q. Upon the life of a gas holder.

A. Yes, the life of a gas holder in my experience has varied all the way from fifteen years up to—I have known them to go as high as sixty years. I have had them give out inside of fifteen years. I have had to displace them inside of ten because the land was required for other parts of the plants. Making it necessary to absorb the cost of that holder for other reasons than the mere——

2121 Q. I am not talking about change of plant, and your wanting to remove your plant and wanting to tear down the holder for that purpose, but I am speaking now of the depreciation, the wear and tear which you have to take care of; what is the life of the gas holder upon which you base your calculation for that reserve?

A. That I could not answer at all generally, Senator. It would have to depend upon the case.

Q. I am confining myself to the holders of the Consolidated Gas Company.

A. They will vary in their life. I couldn't tell you what each holder was without having it all specified, and making a separate problem of it.

Q. In arriving at this figure of 40 years we would like to know what length of life you gave the holders?

A. I took a general survey of the whole field, and I set a life of 60 years on the distribution plant as a whole, and a life of 33 years on the works as a whole, and it happens to average up about 40 years. It would vary from year to year.

Q. When you have taken the holders and the mains of a gas plant you have taken the largest investment of capital, haven't you, that is here in the City of New York? That is, more than half of the capital employed is in mains and holders, isn't it?

A. In the works? I think not. My recollection is it is not. Of course you have a large amount of property in the distribution system outside of mains, services and meters, and the general property which we have roughly included in distribution all the way through.

Q. Did you take into consideration buildings, in making the 40 year term for depreciation?

A. Yes.

Q. And you calculate that the buildings will have to be replaced in 40 years?

A. Oh, no, that is not the basis of my estimate at all.

Q. Well, what life did you give to a building?

2122 A. That will vary according to each particular case as to the chances whether it will have to be displaced, extended, whether built with a design for the future, whether they have invested their capital for the future, or simply invested it for the present, and so on. It is not nearly as much a question of actual killing of the plant as it is of readjustment and the like.

Q. Well, an extension would be a replacement, wouldn't it?

A. Certainly not.

Q. Then whether they have got to extend their building for the future would have no bearing upon the depreciation value?

A. A very great bearing.

Q. In what way?

A. Suppose I laid out a plan for works, as I have seen many of them laid out, and have bought some of them, and it was built to sell, built perhaps to strike an established company. They might have spent as much money on that plant as would have put up a good plant. Poorly advised. Now, if they design that plant for the present uses, the undertaking continues and we have to go forward with the business, the depreciation on that plant will be very much greater, irrespective of whether they are good bricks or poor bricks, or good iron or poor iron, because not having been designed for the future they will have to be torn down and extensions made in that sense. Now, to a greater or lesser degree that enters into all questions of depreciation, because human brains are fallible. No man has the foresight to equal his backsight, and he cannot possibly in advance lay out that plant which will be best, all things considered, for the future. Mistakes must be made and capital sunk in that way.

Q. Well, supposing we take a plant which was in 1886 producing 19,500,000 cubic feet of gas daily, and in the same building they to-day produce 51,000,000 of gas daily. Would you
2123 consider that that plant provided for depreciation?

A. In that particular element that would be favorable; for the future it would be unfavorable, already crowded to its capacity.

Q. Then I understand that you would figure, if there was to be an extension of those works, that that extension would be figured as a depreciation of these buildings now, is that right?

A. Certainly not. If I had a building or a plant to extend and in any way I had to sacrifice parts that had already been capitalized, that part would be written up against depreciation, so far as the new plant went in to extend the capacity and had nothing to do with the parts displaced that would be a legitimate extension. So far as I had to sacrifice the old construction it would be a depreciation. I differentiate very particularly between the two.

Q. How much of the plant of the Consolidated have they sacrificed in this way in the past twenty years?

A. You ask me how much they have?

Q. Yes.

A. I don't know, sir. I have not been around here for twenty years examining every detail. I will say this, that from my knowledge of the way they keep their accounts, and my observation of these matters, they seem to follow a conservative, fair policy in that regard and try to make the adjustments fairly between the two elements. You cannot say any further than that.

Q. In your examination before the Gas Commission you stated you had known of some cases of an accruing depreciation being completely cared for by a conservative policy and charging liberally to repairs and to a like extent dealing lightly with construction accounts.

A. Do you ask me a question now?

Q. I ask you if you remember testifying to that?

A. Oh, yes, that is in accord with my views.

Q. Has that been the policy of the Consolidated Gas Com-
2124 pany?

A. No, it has not. My understanding of the policy, and an examination of the accounts submitted to me indicates they have charged up their repairs, but they have not charged up in any such liberal way as against the replacements; in other words, putting in a new plant in addition to replacements as would cover the accruing depreciation. The case I had there in mind is more particularly the English case where they have an item they call "wear and tear." They interlock repairs and replacements together, as they can do if they wish. Preferably I should do so. I believe the two are interlocked. For instance, if a man does less repairs to his plant, he is going to have more renewals, and so on. Now the English companies spend a certain amount "wear and tear" and they treat this item liberally in their bookkeeping, and their amount spent for wear and tear is as a rule as much as I have included for actual repairs and depreciation in this case. So we find in the case of Massachusetts companies.

Q. In the case of the Consolidated Gas Company you have gas works that in 1884 were capable of producing 4,000,000,000 cubic feet annually, or about that, and twenty years later the engineers of these same works testify they are in perfect operating condition and repair. Would you deem it necessary to charge a depreciation item to operating accounts of works so increased in capacity as to enable them to deliver 10,000,000 cubic feet daily?

A. Certainly. It would not affect my opinion a particle. The question is what is going to happen now. The mere fact they have kept their works up is going to save them for all time to come from the renewal plant. I am just as efficient to-day, as I said to the Commissioners, and more so, than I was twenty-five years ago, to testify here; I have had a great deal of experience, but I am twenty-five years nearer my death. Somebody else will have to
2125 testify shortly for me, I hope.

Q. Would you consider then the condition of the Consolidated and its plants a matter more of good luck than good management?

A. Oh, no, sir; no, sir. It has been a very well managed concern. Mr. Bradley is one of the greatest gas engineers we have seen in America.

Q. And if they have been able for more than twenty years to keep this plant in perfect condition, so much so that an expert examining it to-day can find practically no depreciation from an absolutely new plant, wouldn't you consider that they had taken care of the current renewal and the current depreciation?

A. Yes, sir, current renewals and current depreciation but not final renewals; that is the whole story.

Q. And had postponed the day for final renewals very materially?

A. No, sir. I based my calculations upon the property being kept up.

Q. Mr. Addicks, he is a gas engineer of eminence, I believe?

A. Yes, sir, very great.

Q. He has sworn in this case, in an affidavit, that about four-fifths of the present generating capacity is in the shape of modern up-to-date water gas plants, which could not be improved upon anywhere, and the coal gas plants while composed of some apparatus which is not of the latest pattern are as efficient and in shape to operate for an indefinite period without impairment of efficiency. Is that your judgment, too? Do you concur in that?

A. I concur to this extent, that a plant, so far as efficiency is concerned, if kept in repair, will last up to the time it has got to be renewed. The plant can be efficient and still have to be renewed. A boiler, for instance, works perhaps efficiently up to the day it is renewed, but the day comes when it must be renewed.

2126 Q. But you can by continually renewing parts of the machine, you can very largely extend its life?

A. Yes, sir, and that I take into consideration. That is all included in what I call partial and current renewal. There is where the money goes. They have spent a lot of it for that very purpose. The whole amount I have got in for repairs and renewals taking in depreciation and everything, I have only included 14.15 cents and they have spent for the last twenty years 10.60 cents. Now that figures out—I think—I am not much on memory, but I think I am right about that, I have only got there 3.55 cents for accruing depreciation for the future.

Q. If you were dealing with an entirely new plant, Doctor, you would take forty years as the life of that plant for the purpose of depreciation, would you? I mean for the purpose of establishing a fund for the depreciation?

A. I really don't know what I should take, Senator, until I had examined the plant, as I have said, and I never yet failed to lay great stress, especially in lecturing to my students on the commercial side of engineering, that each case must stand by itself. I would want to examine that plant and consider the local conditions, what the chances were, whether the man had designed this plant along the lines I thought would last and it would be largely a matter of judgment as to that. I would not give any general statement of that kind and should carefully warn anybody against it.

Q. Well, assume a modern, up-to-date, well-built coal gas plant, new to-day, and you were called in to give advice as to the necessities for reserve, would you calculate the reserve on the forty-year basis, as you have in this case?

A. As I have said, I should want to know a great deal more than simply about the plant. I should want to know the conditions generally, the business conditions and everything else. 2127

Q. What do you mean by business conditions in reference to a depreciation fund for a plant?

A. Well, I have already given one example, a very important one; the plant even though it were well designed, well built, but was not designed to best meet the conditions of that locality, as to using the materials, best adapted to the supply of gas in the locality, and best adapted to meet what I should consider the requirements of that business ten years hence. My judgmnet would be very much affected as to what I should set aside for depreciation. The unfortunate part of it is that the term depreciation has been used so much. I try to get out of it myself and use the term renewals, final renewals. Depreciation seems to limit it strictly to what you have in mind.

Q. Well, assume instead of depreciation then the word- "final renewals" as you define *it?*

A. And then the same question?

Q. Yes.

A. I have already answered it. That that would depend on the conditions in that particular locality and whether the plant was adapted at that time, and whether I thought it was adapted as to the future, or whether circumstances would come along which would make it necessary to make a change in the methods of production.

Q. The purpose of establishing final renewals then, or whatever you call it——

A. That is, I think, the best term to use.

Q. A final renewal fund—is it for a fund which will replace a plant when it wears out?

A. Not entirely, no, sir. It is to maintain the asset of plant at par. Now, it may not be used for renewals at all. We have fulfilled our duty as managers if we have kept our plant asset at par and can do that by placing certain moneys as I have explained in
2128 extensions, and do not recapitalize them, but have that piece of extension take care of that piece of depreciation. Of course that is practically being done all over the world in every business.

Q. Cannot you put it back onto the plant itself in the way of renewals and replacements as different things do wear out?

A. Cannot you?

Q. Yes.

A. That is a question, sir, that I am extremely glad you asked, because if I could reply to that so it could be understood, it would meet the whole question; it is because the plant does not wear out in that way that we have to have this money set aside from year to year. We want to spread the expense from year to year. Now, to take an example. Suppose it is a 40 year life. You will have to use your imagination a good deal, I never knew of such a case, but I think it will stand, and that the plant had been built——

Q. My imagination is in pretty good working order now, Doctor.

A. Well, we will try to cultivate it still further before we are through. You had a plant built up in units of 1/40; each year there was a unit added and it went on to the 40th year. Now, after that the complete cycle would take in renewal of 1/40 each year; you would not need any renewals fund. Now, the nearer you come to that, the nearer the current expenses meet the total renewal requirements, and in this case they come within 3½ per cent. a year of doing it. There is the point.

Mr. Page: May I suspend my cross-examination now and let Mr. Burr proceed with his. I have a few more questions I desire to ask, but I do not feel well enough to continue at this stage.

The Master: Proceed, Mr. Burr.

Mr. Mathewson: No objection.

2129 Cross-examination by Mr. Burr:

Q. You reach a cost at the burner of 51.802 cents per thousand cubic feet, Doctor?

A. No, sir.

Q. At page 1945 of your testimony, it is stated, "Cost at the burner, exclusive of repairs, other renewals, depreciation and contingencies, including extra hazards 51.802."

A. Quite correct, sir. That is not the cost at the burner.

Q. Well, it is the cost at the burner exclusive of the things that are stated here?

A. Yes, but that is a very different proposition. In other words, I have already eliminated some of the cost for my own purposes, as carefully explained.

Q. You have assumed this 51.802 to be absolutely correct as deduced from Exhibit 94 and the accounts set forth in that exhibit?

A. Yes, and with some adjustments that I have made myself here.

Q. Have you carefully analyzed the accounts of Exhibit 94?

A. Not the books—I have not made an exhaustive audit of the books. I start in with the general assumption that it is correct and that it has been approved, not that particular year, but the other years have been approved by the Stevens Committee Audit. And there was so little variation between the two that I felt warranted in taking that after a rather exhaustive examination myself extending over some months of the different figures involved, but as to having audited the books in the complete sense I have not done it.

Q. Have you examined the vouchers for the items appearing on the exhibit 94?

A. No.

Q. You have as a matter of fact accepted the statements on Exhibit 94 as correct?

A. I have. I have readjusted some of them.

Q. Then, as a matter of fact, your testimony as an independent expert is wholly based upon statements made by officers and employees of the Consolidated Gas Company? 2130

A. Not wholly, no, sir. It is based to the extent that I have drawn out. As I have not seen the records, I am assuming the record is the same as my sheet.

Mr. Burr: That is all I want to ask.

Mr. Mathewson: Mr. Carter is here, if Mr. Burr can proceed with any cross-examination that he has of him.

Mr. Burr: I have no questions to ask Mr. Carter now, but I would like to know if I can obtain this information: I asked Mr. Addicks some few days ago regarding the largest sales upon a given day and he was unable to give it. Now I want to ask if he will name the day in 1905 when there was the largest aggregate manufacture of gas by the Consolidated Gas Company, and state the total gas manufactured on that day by the company.

Mr. Mathewson: That can be done. Yes, we can do that.

Mr. Burr: Now can I also get, for the same day, the total gas manufactured by each of the companies with which the Consolidated Gas Company has agency agreement?

Mr. Mathewson: No, we cannot do that. We have no record of that sort.

Mr. Burr: Haven't you the means of procuring that?

Mr. MATHEWSON: Well, I do not think we could invoke the risk of subpœna.

Mr. BURR: Under your agency agreement you have the right to look at their books at any time.

Mr. MATHEWSON: I do not think we should be asked to do that. We stated the amount of gas that we procured from them, and how much more they make or sell it does not seem to us is pertinent. So I should not attempt to do that unless the Master directed it. 2131 & 2132

The MASTER: I shall not direct it. I think you will have to subpœna those books, Mr. Burr.

Mr. KIRBY: You have no other witness?

Mr. MATHEWSON: We have Mr. Carter here if you desire to cross-examine him.

Mr. KIRBY: I am under the impression that we shall not want to cross-examine him, but I do not want to take that burden on myself.

The MASTER: I understood Senator Page to say that he had something else to ask Mr. Carter.

Mr. MATHEWSON: I understood otherwise, but suppose the Master is right.

The MASTER: Yes, I think you had better be here in the morning.

Mr. CARTER: Very well, sir, I will be here.

At 5 o'clock P. M., adjourned to to-morrow, Thursday, September 13, 1906, at 11 o'clock A. M.

Last Exhibits:

Complainant's 237.
City's 44.
State's V.

2133 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *September* 13, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Garver, Mr. Page, Mr. Burr, Mr. Kirby.

2134 ALEXANDER HUMPHREYS resumed.

Cross-examination (continued) by Mr. PAGE:

The WITNESS: I would like to make a correction in a statement of mine, on page 2090. It is the question asked as to what would be the difference in pressure due to change of altitude, and I understood the question the reverse, that it was for a thousand feet rise in 70. Of course I did not take the 70 into calculation at all, and it would not make any difference.

Q. Where is the question?

A. The question commenced on the other side. Now, if I understand it, you want to know what would be the change——

Q. Well, I changed it, making it ten feet to the thousand instead of ten feet to seven hundred?

A. Nor did I catch the fact that it was ten feet rise. I thought you wanted to know what would be the change due to an altitude of one thousand feet, and my calculation was based on that. Would you like to have it answered as to ten feet or to 70, that is 100 feet in a thousand?

Q. No, my question was as to a rise of ten feet for a thousand feet length of pipe.

A. Oh, it is changed to ten feet in a thousand?

Q. I did that, thinking it would be an easier computation.

Mr. KIRBY: It amounts to what was the difference in each ten feet assuming the straight length of pipe.

A. The length of pipe makes no difference in this calculation whatever. It would be for the specific gravity 65, for each ten feet, it would be .0517. That would be the change in pressure without
any regard to any other changes introduced by flow or the
2135 like. So it would be a deduction or addition to pressure pro-
vided there was no flow from the point on to the point where
the gauge was placed to take the pressure.

Q. While we are on this subject, you spoke of the difficulty of delivering gas because of the ups and downs, I think you used the phrase "knobs and hills."

A. Knobs and valleys, or hills and valleys. I was trying to explain the uneven stages in elevation without any regularity, any plains in it.

Q. On page 2094 the answer was, "That is not the worst of it, it is a question of hollows and knolls."

A. Well, that is better than my term. Much obliged to the stenographer; it is certainly more elegant.

Q. Now, Doctor, if you have gas running along here and it goes up a hill and then down again, isn't that in effect the same as having a pipe on the level?

A. No, sir.

The **Master**: Why not make a diagram of that, illustrating the level and the hill and the hollow and mark it A, B, C and D, and ask the questions and have the diagram marked in evidence and let it be reproduced in the minutes, and then it will be intelligible. Because it will not be intelligible two months from now, and it will not be intelligible to the court, while a diagram would make it clear to everybody.

(Diagram drawn by Senator Page was marked State's Exhibit W.)

Q. Referring to State's Exhibit W, in which we will assume that the line A-B is at sea level, that A-C-B represents a hill having its highest point 100 feet above sea level—and that the C is at the highest point 100 feet above sea level; assuming that the gas is not flowing
and gas is turned on in the pipes will not the increase of
2136 pressure of the gas as it rises from A to C have an effect to
push the gas down the hill to B and will arrive at B at the
same pressure that it started from A?

A. I would not like to accept the term push, but while the pressure will vary constantly in passing over the hill under the condition you named, no flow will be the same at B at the same pressure.

Q. Assuming that the flow has been established, will not the resistance of the gas in passing from C to B equalize the increase in pressure from A to C and establish a substantial equilibrium of pressure from A to B?

A. No man could answer that without having an exact statement of the amount of pressure that would be taken off at each foot of pipe. There would be a general tendency from A to C for the increase of pressure due to change of altitude to compensate for the pressure lost through flow of gas. From C to B, on the other hand, the loss of pressure due to altitude change would be added to the loss of pressure due to flow.

Q. Assume that at B there is an opening to the atmosphere.

A. A full opening?

Q. A full opening, and that there is no gas drawn off between A and B, then how would it be?

A. The pressure at B would in that case not be changed in any respect by the change in altitude, but as to what the exact pressure would be would depend upon the rate of flow.

Q. Take a point half way distant between A and C, which we will call X, and a point half way distant between C and B, which we will call Y, each of which is 75 feet above the sea level, would the pressure be the same at X and Y, the gas flowing through with an opening to the atmosphere at A and B?

A. No.

Q. Which would be the greater?

A. The only gas being taken off is here at B?

Q. Yes.

A. The pressure would be greater at X.

2137 Q. Why would it?

A. Because you have got to have the pressure up to this point X necessary to push that up. In other words, pressure will continue to be absorbed all the way to B, so far as flow is concerned, irrespective of altitude.

Q. And so pressure would continue to be absorbed if the pipe passed on a level between A and B?

A. Certainly.

Q. So that the same condition would obtain in regard to the absorption of pressure whether the pipe was on a level or——

A. Due to flow, exactly, given the same pipe.

Q. Then I will alter my question in this way. Would the pressure be the same at B as it would if a pipe was run on a direct line from A to B?

A. No.

Q. Would it be greater or less?

A. If run on a direct line it would be greater.

Q. Because there is a greater length of pipe going over the hill?

A. Yes.

Q. Now if we assume the same length of pipe then from A to B on the level, the pressure would be the same?

A. In other words, turn your plan over and let it be a turn on the level.

Q. Yes.

A. No.

Q. Would it be greater or less?

A. It would be less, because you have absorbed some in the curve, which is a partial bend.

Q. As I understand your answer, if this line A to B was flat on the ground on a curve——

A. (Interrupting.) That would be the same in either case if the altitude was the same.

Q. That is, if this curve instead of going up in the air was laid on the ground.

A. That is right; it would be the same, if you eliminate altitude, in either case.

2138 Q. The absorption of pressure by distance is the same whether the pipe goes over that hill or whether it goes on the level for the same distance?

A. For the same distance, except as the curves reduce it by going over the hill, we have to introduce bends of one kind or another, but I am perfectly willing to state my position——

Q. Therefore, with the gas passing through a curved pipe on the level, the pressure would be greater at X than it would at Y?

A. Yes.

Q. And would it be the same difference in pressure as it would be at X and Y and passing over the hill from A, C, B?

A. No.

Q. Why wouldn't it?

A. With the same difference in pressure?

Q. Would it be the same difference in pressure as it would be at X and Y and passing over the hill from A, C, B?

A. It would be with regard to the absorption due to the passage of the gas.

By Mr. Mathewson:

Q. But it would not be if you take into account the change of altitude?

A. No.

By Mr. Page:

Q. In passing over the hill you take into consideration the question of altitude?

A. And I say that, as far as the absorption going through the hill pipe is concerned, there won't be any difference, but of course there will be the difference due to the altitude in each case. In other words, the difference due to the altitude will be found in every point as indicated by that altitude; if you put on a gauge and have that condition, it is liable to occur at any moment, if there is no flow on that particular run.

Q. We are supposing that flow?

A. That I cannot answer you without having the data and the rates of flow and how much is taken off each line.

2139 Q. Assuming a constant flow and a free exhaust into the atmosphere?

A. Well, assume that, and then what?

Q. Well, wouldn't the pressure be the same, minus the absorption of pressure?

A. On a hill.

Q. At the points X and Y, or in other words would not the pressure be the same between A, X, and between Y B, X and Y each being at an altitude of 75 feet?

A. The previous questions as I understood them referred to a comparison between this curved pipe standing up vertical and laid on the flat. Is that what you are still asking?

Q. Yes.

A. There would not be the same pressure, of course, if it stood on the vertical as if it stood on the flat. At this point there would be the difference due to the altitude, whether it was flowing more or less.

Q. The flow though would change that difference?

A. It would not change that difference, the difference due to the altitude, in any respect. You would always find a difference there because here you gain and there you lose (indicating on Exhibit W.)

Q. You gave the valuation for the mains, that is, you agreed with the valuation given by Mr. Simpson?

A. Yes, sir.

Q. What calculations did you make to find out whether he was right or not?

A. I took City's Exhibit No. 1 for identification and went over each item in detail on a number of occasions with Mr. Simpson, going into original data as far as I could and going over every step of the calculations individually, making every calculation myself, and finally arrived at the conclusion that the estimate of $12,636,150.04, as the present valuation on a replaced basis, was less than the actual replacement value.

Q. That is you took the figures and verified the multiplications and the results.

2140 A. I did that and a great deal more. I took all the data that he could supply me, cross-examined him carefully on every assumption, agreed with him where I could, disagreed with him in a number of cases where I thought he was too conservative, and arrived at the result, as I said, by saying that he is under the value, and positively I believe that that is the case. Mr. Simpson himself cannot replace those mains in New York under the present conditions for $12,636,150.04.

Q. How many miles of mains did you figure as laid under asphalt pavement?

A. I figured on 90 per cent. of the total mileage, just as Mr. Simpson took it.

By the MASTER:

Q. When you say that, do you mean under asphalt alone or under modern pavements of all kinds?

A. Modern pavements; asphalt, granite block on concrete, wood block on concrete and block asphalt on concrete; those four.

By Mr. PAGE:

Q. It costs a great deal more to lay an eight inch main than it does to lay a four inch main, doesn't it?

A. Eight and four, oh, yes, a good deal more.

Q. Now if a greater proportion of the larger mains were under the cheap pavements, your calculation would be out, wouldn't it?

A. Somewhat out, yes, sir.

Q. There was not presented to you, was there, the exact mileage and size of each main that was under each kind of pavement?

A. It was presented to me at so many miles of each size, with a general statement as to the percentage of these so-called new pavements in New York City. I called for verification and they

2141 gave me the records that they had collected as to details from the Bureau of Highways or whatever it is. In, however, checking off Mr. Simpson as to his percentage, I took very careful count of the points you have named and assumed a figure for the pavement which I felt was entirely safe, even to cover that point.

Q. Did you go to the books of the Company to discover what it had cost them, or did you assume the costs?

A. I went to many of the records of the company, including Mr. Simpson's black book, and Mr. Simpson gave me free access to all the information he has, as far as I know. I put him on the witness stand.

Q. Did you take account of the books of the company for excavating, and did you take the actual cost of excavation that you found on the books, or did you assume the figures?

A. I took the figures submitted to me by Mr. Simpson as the result of their own experience, necessarily varying, and having to be more or less averaged, and checked them up by my own extensive experience, as to what it would cost for labor and so forth.

Q. What figure did you take as the cost of excavation?

A. I took as the figure for all labor and cartage per foot for one and one-half inch fifteen cents, and so on down. I will give you the figures if you like. I took the figures that appear on the exhibit referred to for that item.

Mr. Mathewson: State's Exhibit 1 for identification, to which counsel is referring, refers to the situation "if the current prices for pipe and lead" are used, that referring to the prices current in January, 1906, when this was made up, although it relates to the mileage of October 31st, 1905, which was the amount before the Gas Commission.

2142 Q. In your computation for labor and cartage you included the item of labor and excavating and laying and back filling and in handling the pipe?

A. I have.

Q. Did you include labor for repaving?

A. Everything for paving is handled in that other item.

Q. You valued the pipe differently?

A. The pipe itself, yes.

Q. Did you calculate a uniform price for labor and cartage in the case of the excavation in rock as you did on excavation in dirt?

A. Not exactly beceuse we went over the figures on the average as to what it actually cost per foot, which would take into account those variations, of course. The facts would show for themselves in the average price as made up in the records.

Q. What percentage of the excavation throughout the City did you figure to be in rock?

A. I figured the same as Mr. Simpson—10 per cent.

Q. And you figured what it would cost to lay each pipe separately, entrenched by itself, and assumed an opening for the laying, an opening in the pavement, and the repavement, in the cost of these pipes?

A. Yes, sir; that is, each size of pipe; not each pipe, I didn't mean computed each individual job, but each size of pipes we considered separately, just as shown on this table.

Q. A great many of these mains were laid by the original companies that afterward consolidated in the Consolidated Gas Company, weren't they?

A. I presume so.

Q. And that in some streets there were mains of your company?

A. No doubt of it.

Q. If you were relaying those mains to-day would you lay them separately, or would you lay one larger main, if the requirements of the delivery in that street required the diameter of the two mains?

A. Personally, I should lay two mains.

2143 Q. But you would lay them at the same time?

A. I would lay them at the same time.

Q. And there would be but one opening in the pavement?

A. No, two.

Q. You mean by that, you could lay one each side of the street?

A. Yes

Q. Aren't there cases where mains were laid on each side of the street and duplicated by a different company?

A. I imagine there are.

Q. In such a case as that, would you lay four mains?

A. If I was starting with a new proposition.

Q. Well, if you were reproducing it as you are in imagination now?

A. Well, I am reproducing this particular plant just as it stands, just the sizes.

Q. You are not reproducing the distributing system. That would take care economically of the output of gas as it exists to-day.

A. I haven't studied that sufficiently to say just exactly how I would lay it out; that would be a problem by itself. I am taking this property as I find it, and valuing it as to what it would take to reproduce that property in the present conditions.

Q. That is, if originally three competing companies laid mains in the one street, you would produce to-day, I mean on your theory here, you would reproduce those identical three mains?

A. That's about it.

Q. Although each main might have been sufficient in itself to carry the delivery of gas to-day?

A. I have not gone exhaustively into that question as to whether one pipe would be sufficient or not, but I don't imagine it is so at all.

Q. You have not studied, in making your estimate of the cost of reproduction, the distributing system of the company; you have not studied present conditions except that they are to take the pipes as they are now in the ground, and figured what it would
2144 cost to put them there now?

A. That is practically what I have done. I have studied present conditions.

Q. To what extent?

A. To the extent of understanding how they are conducting the business, but not to go to work to make out an engineer's diagram as to what exactly in my opinion would best provide for the present demand and in the most economical way provide for the demand in the future.

Q. As to the mileage of mains of particular pipe, you took Mr. Simpson's statement, you did not go the maps to discover and check that up, did you?

A. No, sir, I did not.

Q. You did not go to the maps to discover where these particular mains were situated?

A. No.

Q. Nor how many of them were in particular streets?

A. No.

A colloquy now ensues between counsel which the stenographer is directed not to report.

Q. In arriving at your conclusion you included the 27 miles of mains that are not now in use by the company, did you not?

A. I included this whole mileage of 822 miles, nearly, I think it is.

Q. It is 822.2?

A. Yes, sir.

Q. You know that Mr. Simpson has testified that the active mains of the company are only 795 miles?

A. I do not remember the exact figure. I remember that he testified that there was some few feet less active than the total number of 822.

Q. 27 miles would not be some few feet; it would be some many feet, wouldn't it.

A. It is not a large percentage for New York.

Q. It helps out pretty well on the final estimate of cost, does it not?

A. Yes, money is invested in it.

2145 Q. If you were reproducing this system to-day you would not reproduce pipes that were not necessary and not in use?

A. No, I might put in pipes that are not absolutely necessary at the time, and probably should if I had any sense at all.

Q. Then, such pipes as you would put in to take care of future business would be extensions beyond the mileage of mains, here, would it not?

A. That would depend upon a very careful survey of what there is here, and whether or not there is provision for the future, which I presume there is.

Q. If you were called upon to estimate upon the cost of producing to-day a distributing system to meet the needs of the City of New York, in the Borough of Manhattan, you would take into consideration all the conditions surrounding it and the most economical way of handling that distribution, would you not?

A. I certainly should, yes, sir.

Q. That was not the method which you used in arriving at your figures of the cost of reproduction here?

A. My method was to take the pipes as listed to me and calculate what it would cost to lay those pipes under present conditions.

Q. For the purpose of establishing a fund for depreciation, you set a value upon the plant that is to be reproduced, do you?

A. Yes.

Q. What value did you take in the case of the Consolidated Gas Company?

A. I took for the value of depreciable property $34,419,418.38.

Q. Did you separate that into different items, that is, as to manufacturing plants and buildings?

A. No, I took the manufacturing plant as a whole and the distribution plant as a whole.

Q. What figure did you place upon the manufacturing plant?

A. On the manufacturing plant in Manhattan, eliminating for this particular calculation the 18th Street plant, I took $14,329,591.17.

Q. And the distributing system?

2146 A. The distributing system, including the general item to which I have referred before, $12,589,827.31. And for Astoria $7,500,000, depreciable property.

Q. Astoria, they have not finished building it yet.

A. I have to include it in an estimate of this kind, because this has to do with the future as well as the present. It is practically finished, and depreciation will commence the moment that things are paid for and delivered over. Of course this represents not nearly what will be the full value of the plant when completed. I am modifying my estimate somewhat on that line for the present estimate.

Q. In figuring your amount necessary to take out of the gas sales, you have figured that on the 13,300,000,000 cubic feet as delivered to-day?

A. Yes.

Q. While the plant, including Astoria, would deliver in the neighborhood of 15,000,000,000, would it not?

A. Yes, but I have not included the value of the plant when it is delivering 15,000,000,000. I made a modification on that account.

Q. What modification have you made?

A. I have taken the estimate of $13,134,519.65 and I have taken out the tunnel and the land, although, of course, they would not depreciate; but they have value as far as the plant is concerned, and you have got to consider that. I have taken out for part value of the holder, because it is not finished, and I have taken out the coal sheds, etc., to the amount of $1,500,000. In other words, I have deducted from the $13,134,519.65, on account of the things that are not involved in depreciation, on account of things that are not at present depreciable, reducing that amount then to $7,500,000. This in my opinion, will increase the depreciable property,—when the plant is completed, to about $9,300,000. There may be considerable more than that due to other items as they will be put in as specified in the supplemental estimate.

2147 Q. You have made your computation on the idea that a forty-year term would represent the life of the plant?

A. Yes, as a whole, averaging everything up.

Q. If you should value this plant next year would you deduct one-fortieth?

A. Valuing the plant next year?

Q. Yes, one-fortieth of your valuation of this year?

A. It would depend on what I should see when I look the plant over.

Q. In twenty years would you assume that the plant had depreciated about one-half, and if you were called upon to value it at that time would you take that into consideration?

A. I should confirm my previous estimate by careful examination, and I should particularly look out to see whether they had put back into the plant, without charging to construction, amounts to compensate for depreciation.

Q. Assuming that they, having been advised as to your theory, had adopted it and followed it out in every particular, would you then, if called upon to value the plant, value it at one-half of the valuation?

A. If they had adopted my theory and I should be called upon to appraise it at the end of forty years, and my estimate was practically correct, the result would be to appraise it at exactly the same value.

Q. Exactly the same value as to-day?

A. Yes, sir.

Q. That is, you mean if the same amount of extensions had been made?

A. No, I am not referring to the extensions in general. I am simply referring to such additions as the Massachusetts law puts it, "Additions and enlargement as against depreciation." I think that is the way it is expressed. If I had found that they had carried out my theory—I say mine, it is the one I am using, it is not mine; it is the one that is used all over—if I found that they
2148 had carried that out, and had, in addition to the amount actually expended for actual renewals, so that the plant was brought back not only by repairs, but by renewals, out of this fund—if in addition to that they had extended and enlarged their plant by the use of this depreciation fund, and that was within the scope of my appraisal, if my theory is correct, the appraisal would be the same, providing the units of value would be the same twenty years hence.

Q. That is, assuming that they had expended in renewals one-half the value of the original fund, or whatever they call it here?

A. Yes.

Q. That is, that they had expended $17,000,000?

A. Always providing that nothing has entered in to disturb the calculation. As I say, I should go and look at the plant and examine it and value it according to the values then apparent.

Q. That is the purpose of accumulating this fund or using this fund, because there are elements which enter in to disturb your calculations?

A. Yes, and as far as human foresight can go, you do introduce those elements.

Q. As to the portion of the Consolidated Company's plant that was taken over in 1884, did you apply this theory of depreciation in your valuation?

A. Certainly not; that was an entirely different problem. I had no means of knowing what they had spent or had not spent. I took the plant as I found it.

Q. And you found that it was more valuable to-day than it was 20 years ago?

A. Yes, sir, according to present prices.

Q. Therefore, not having been operated on your theory, the plant is worth more than if they had operated on that theory; is that it?

A. No, sir.

2149 Mr. MATHEWSON: The plant to-day is not the plant of 20 years ago, Senator.

Mr. PAGE: It is with the exception of $5,000,000 which you have spent on it.

Mr. MATHEWSON: It is not the same plant; it is changed radically.

Q. And if you were called upon to value this plant 20 years from now you would look at the plant itself and its appearance and value it on that, and not take into consideration this element of depreciation. Is that right?

A. I should not go much by its appearance. I should go much deeper than that.

Q. Yes, I assume that you would make a careful examination of its physical condition at the time?

A. Yes, sir; in other words, I would check up my estimate.

Q. You would not take into consideration that, although that plant was working efficiently, that, nevertheless, there was a time coming when it would disappear like the life of a man would disappear, that you to-day were doing better work and accomplishing better results than twenty years ago, but you were twenty years nearer the end of your life. You would not take into consideration that depreciable value.

A. I should take into consideration exactly what I take into consideration in this estimate, and everything else, the best estimate I could make at the time as to its life, and so forth, as to what its present value, all things considered, would be; in other words I should not be estimating in the same sense with the facts before me, and instead of foresight I would have backsight, or a mixture of both.

Q. Then it would be immaterial to you in that estimate or appraisal as to whether they had spent $30,000,000 or $17,000,000 or had not spent anything?

2150 A. Oh, no, I should take everything into consideration that I could get hold of.

Q. Yes, but if the plant was in perfect condition and was producing the results that it was designed to produce you would not care whether they had spent $10,000,000 or $50,000,000 on it.

A. I should want to make up my opinion as to how much longer they could continue to do that same thing. There must be a limit to the life of a plant by exhaustion of one kind or another.

Q. Then instead of using the theoretical limit of life as forty years you would try to arrive then at the actual limit as near as you could estimate it from its past experience and present condition.

A. And then have to become theoretical again as to the future, just as I have in this case. I have theorized in this case that this present plant, all things considered, will have an average life of forty years.

Q. The 1.05 per hundred dollars invested at 4 per cent. compound interest in forty years would equal the value of this plant?

A. Yes.

Q. And that is a very general way, is it not, of handling a sinking fund for depreciation?

A. I think it is not at all general in the United States in my experience. The case I have just quoted, one of the few under legal restrictions, in Massachusetts they don't do that. On the contrary the law, and the new law at that, specially provides for its being expended for renewals, etc., and the municipalities objected to putting it out in any form of sinking fund, thinking it is better used in their own business.

Q. That only relates to the municipal operations?

A. Yes.

Q. Now you prefer to take instead of 1.05 on the business today, 2.5?

A. I do.

Q. Because $2.50 without interest in 40 years will equal $100?

A. Yes, sir. In other words you are spreading the load evenly. If the total loss is $100, the total loss is going to be spread over 40 years. Then you spread the load evenly by putting $2.50 on each year. 2151

Q. Well, the load would be spread evenly by taking $1.05 each year, wouldn't it?

A. No, sir, it would not.

Q. Your idea is that this $2.50 invested in extensions will produce a greater return than $1.05 invested at 4 per cent. compound interest, is that right?

A. Not exactly. It is somewhat in the direction of my line of thought. My idea is that the $2.50 devoted to compensation for yearly depreciation, so much of it as is not used during the year currently for renewals, what I call current renewals, will be put into extensions of plant as an offset of the depreciation that has not yet developed, and so much of it as goes to those extensions, will win earnings.

Q. The ordinary repairs which were made, and which you have specified you would take out of this $2.50, you have already taken out in your computation, haven't you?

A. In my computation I take out the ordinary current repairs for that particular year as they would vary very widely from year to year and do not furnish a safe figure for average results, and I introduce in place of that the average current expenditures for repairs during the period of 20 years.

Q. That was an entirely different factor than is involved in the depreciation factor in which you have provided a fund to replace the plant 40 years hence, $2.50, is it not?

A. No, sir, it is not. It is quite in conformity. The whole thing is very consistent in my opinion.

Q. But as I understood you to say, that there is a necessity for providing a fund which will take care of the invisible depreciation——

A. Yes.

Q. That will result in death at forty years from the birth?

A. That is right.

2152 Q. And that $2.50 on the $100.00 is the amount that is invested in the plant?

A. That is right, and that amount is fixed after considering the repairs. I consider the whole problem together. I know some companies I examined I should not put in anything for depreciation at all, because there is so much money being expended for repairs, current renewals and small extensions, and the like, which do not appear as expenses, but which really go into that account. They all go into the wear and tear account, and when I find that to be the case I even go to the point of cutting down.

Q. Now, you invested $2.50 instead of putting it in the bank, putting into the gas business in the way of extension?

A. Yes, sir; part of it.

Q. And you figure, I suppose, that that would bring a return of 10 per cent.?

A. No, I do not go as far as that. I figure it will give us at least 4 per cent., because we have to bear in mind that at first the investments of the gas companies do not bring in large returns; they have to be built up.

Q. But, Doctor, we are not taking a new gas company and starting it; we are taking a gas company that has been established for years.

A. I understand.

Q. And we are providing for that.

A. Yes.

Q. Let us get away from any new gas company idea.

A. I have not introduced the new gas company idea. I was considering this particular case, and had fully in mind what you had.

Q. Let us get down, eliminating the new gas company——

A. I would be very glad to eliminate it, as far as I am concerned, because I have never introduced it.

Q. And answer the questions.

A. I will answer them just as you ask them.

2153 Q. You calculate that the Consolidated Gas Company would earn on those extensions 10 per cent.?

A. I do not at the start, no, sir.

Q. Why not at the start?

A. Suppose it is an extension of pipe; they have got to wait until they get the business and build the good will up. Now if it is renewal, that is another proposition; that is not new money, it is a renewal of the plant as it exists. If it is an extension of plant which is not fully demanded, but it is demanded partly for the increase of business and partly by wise management, for increase in the future, which must be provided for, it is not earning to any such extent as 10 per cent.

Q. Give us the amount it would earn on your theory?

A. I don't know. I should have to have each case by itself.

Q. But we have got a fund here that you built up, $2.50, and you say that it would earn so much more as one reason you want it put into the gas business instead of putting into the bank to-day a smaller sum which will earn 4 per cent. compound interest. I want to get at what that return will be which makes this a more advantageous theory of handling the money?

A. The only trouble is you have the wrong idea of what my theory is.

Q. I think not.

A. The money reinvested in the business will earn a certain amount, and I simply assume, and feel safe in assuming that, that it will, as a whole, average 4 per cent., and if it does average 4 per cent., then we are putting no greater load on the business than if we put it out at 4 per cent. and deprived ourselves of that as working capital and had to borrow other capital for that purpose.

Q. Well, assuming that it earns 4 per cent., how much would that 4 per cent. on the $2.50 amount to in forty years, the interest itself compounded?

2154 A. You would not have that interest. It is the additional interest that comes in from that $2.50 that enables you to pay the $2.50 as compared with the $1.05. For instance, suppose instead of figuring it that way, I say I will not pay in $2.50, but I will put into the business the same amount that will be required if I put it into a sinking fund.

Q. Well, what are you going to do with that 4 per cent. you earn—distribute it to the stockholders?

A. No, it is required to make up this very amount. Suppose I say I will put in $1.05 the first year, and I will go on putting in a like amount that I should have to pay or lose by way of interest earned in the sinking fund. I would then have to put in $1.05 the first year, the next year I would have to put in $1.09 to carry the interest——

Q. You are assuming that the money is not invested where it would compound itself, is that it, but——

A. I am assuming that it is compounding in the business, and having the earnings, I must take them out to furnish the $100 at the end of forty years, because forty times $1.05 does not make 100, but $42, and some one else supplies that $58. They don't do it for charity, the banks, for instance; they do it because we give them the use of our money.

Q. But there are some charitable individuals that are very glad to do that.

A. I have never met them.

Q. You don't know of any such banks?

A. I don't know of any banks that are willing to give you $58 for the use of $42.

Q. They are reinvesting the money each year and compounding it that way?

A. I am giving that——

Q. Let us eliminate the charity and get down to business.

A. If you are carrying a sinking fund on your own books and

prefer to do it this way rather than put up the $2.50 as an even load throughout the term, what you would have to do would be to pay $1.05 and a different amount each year according to the
2155 accumulated interest until the last year you would have to pay into your sinking fund to cover principal and interest 4.8742, the total coming out nearly right, $99.77689.

Q. That is assuming you had not invested your sinking fund at interest, but that you put away a sufficient amount of money each year to have taken care of the fund and interest compounded?

A. That is putting it right into your business, and you have the return from your business to help pay these amounts, of course, the same as in other cases. But you have an uneven distribution of the load instead of an even distribution.

Q. But this $2.50 you put in your business is going to earn something, isn't it?

A. Yes.

Q. Now at the end of the 40 years what becomes of those earnings?

A. They have been put back into the business and you have the increased earnings from the additional amount you put in instead of putting it out from your own hands and getting in more capital to do it. One compensates for the other.

Q. At the end of 40 years, having put in these earnings, and they in themselves having earned the 4 per cent., therefore you have been compounding your earnings or interest, whichever it is, and take out $2.50 each year and invest that and invest your earnings on that $2.50, and at the end of 40 years what sum would you have?

A. $2.50——

Q. $2.50 compounded at 4 per cent. would amount to how much?

A. I can figure it out in a minute.

Q. You have some tables with you, have you not?

A. Yes.

Q. I would like to have that down.

A. 4 per cent. for 40 years?

Q. Yes.

A. I cannot get that direct from any table I have got. I would have to calculate that out. I will give it to you. Are you
2156 going to examine me after the lunch hour? I can give it to you after lunch.

Q. I suppose Mr. Mathewson will.

Mr. Mathewson: Very briefly.

Q. Then you will be back after lunch, doctor, and can give it.

A. My tables do not give that direct.

Q. Now if at the end of 40 years we are going to buy this plant, you would take into consideration the original plant and extensions and capitalize that, would you not?

A. If I was going to buy the plant I should take into account all the property that was offered, tangible and intangible.

Q. And that would include the original plant and all these additions?

A. Yes, whatever was offered to me.

Q. Now, Doctor, in addition to accumulating this fund you want 5 cents on every thousand feet of gas sold besides, do you?

A. No, I do not want it.

Q. Well, you take it?

A. No, I do not take it as a permanent thing. I simply ask that it shall be reserved as a cushion, because if the price is to be fixed we cannot tell what contingencies are to be met. Even by an experience of twenty years something is liable to happen every day, and I have mentioned a great many of them, all of which I have experienced myself, every one of them; and therefore I say that the company should be allowed for a limited time to take such a reserve, say until they have built up one-tenth of their capital, and then to cease. It is a practice that is quite regularly followed on the other side, where they are very carefully controlled by Parliament.

Q. Well, that 5 cents on each thousand feet of gas as sold would amount to some six hundred and fifty thousand dollars a year, wouldn't it?

A. Yes, I think so; yes.

2157 Q. Of course, the sales of the Consolidated Gas Company increase each year, and have done in the past, and probably will in the future, is that right?

A. I cannot say much about the future. The last year they have increased very little. I think .85 of one per cent.—something like that. They will get an increase, of course—I won't say of course; I don't know—they will get an increase probably from an increase of population.

Q. Well, even eliminating that increase and taking that amount that you want reserved, or that you suggest should be reserved, at six hundred and fifty thousand dollars a year, how long would you take that out—how large a sum would you accumulate?

A. Until it accumulated, say, to one-tenth of the capital.

Q. That is, one-tenth of $80,000,000?

A. No, one-tenth of the capital involved in this particular branch of the business.

Q. That is, this $34,419,000?

A. No, that is the depreciable property; one-tenth of the capital actually and actively employed in the gas business.

Q. That includes land and everything else?

A. Yes.

Q. That would not include stock holdings, you mean, in other companies?

A. No; just as if the Consolidated Gas Company was a separate business standing on its own bottom.

Q. Well, for the purpose of this argument we will make a violent assumption, and assume that the land is worth $15,000,000. You would add that to it, would you?

A. Yes, for this purpose.

Q. Yes; I would not for any other, Doctor. Now, that would make $49,000,000 in round figures, or we will call it $50,000,000. Now, you would go on taking out this $650,000 until you had accumulated how large a fund?

2158 A. About $5,000,000, using it in the meantime for the purpose named, for a cushion; if you had an explosion or anything of that kind, you could fall back on that.

Q. What would you do with that money; if you got it this year, what would you do with it?

A. It would depend whether we had any reason to draw upon it. If not, let it out.

Q. Would you seek some charitable institution?

A. No, I should not expect to do much with a charitable institution.

Q. Would you put it in the bank and let it lie there without interest?

A. I would invest it the very best way I could, whether in the business or any other way.

Q. Well, the best way——

A. It would not be capitalized, and would not be given out as dividends.

Q. The best way you could discover to invest your $2.50 was to put it back into the gas business, it being one of the most productive things you could think of?

A. Yes.

Q. Would you put this back in the same way?

A. I don't know whether I would or not. There would be no objection to doing it in my mind.

Q. And if you did and there should come some of these untoward circumstances which you think might possibly happen, where would your money be to take care of them?

A. You would not have invested that in the business unless you needed that extra capital. You would simply have then deferred the bringing in of the extra capital. When the trouble occurred you would now get that capital which otherwise you would have obtained outside in the first instance.

Q. Then in eight years, Doctor, you would have taken out 2.5, which amounts to how much on $34,419,418.38?

A. Do you mean per year?

Q. Yes.

2159 Mr. Mathewson: I do not see where you get your eight years, if you take out your $650,000 a year and it accumulates. It would take a shorter period than eight years considerably, I should suppose, as that would be without accumulation, would it not?

The Witness: The amount you asked me for would be about $860,480.

Q. Take out $860,400 for that, and on your five cents you take out $365,000. That is, for this purpose you would take $1,225,400 each year?

A. For that purpose, no, sir.

Q. What?

A. No, sir.

Q. Each year up to the time you——

A. I think you are entirely losing sight of one very important element. Before putting in that amount I have deducted, if you will refer to this, the actual expenditures, and as this is based on the full period, I, of course, deduct final renewals. Now in this particular case the final renewals are involved in that 10 cents, but that 10 cents not only involves things in the way of estimates, but things actually spent for in the way of renewals. Now those final renewals—this company has actually spent in 20 years three cents a thousand, so I do not put in the total of that on estimating, but I simply take out the amount which is actually spent and put back in place of it the amount I conceive to be large enough not only to cover the amounts actually expended, but also the amounts which have not been met yet, but are simply accruing liabilities.

Q. Then do we understand that this company has been taking care of final renewals currently?

A. To a certain extent.

Q. And to such an extent that the plant to-day is in as perfect condition as a new plant?

A. No, I do not say that.

2160 Q. I know, but another expert has.

A. It is in good working order, but its life is more or less exhausted. Another way of looking at it is that I include in my estimate for up-keep of the plant, including this amount you refer to, this $2.50, 14.15 cents, whereas the total amount expended for current renewals as found and repairs has been 10.60, which is slightly changed by the figures that have been involved since from the State Commission's amount of 10.89.

Q. As I understand your testimony in regard to this five cents, that is to provide for fluctuation of business, to provide for explosions if there should be any; it is to provide for accidents and injuries and things of that sort?

A. And electrolysis.

Q. And electrolysis?

A. Yes.

Q. Well, that would be depreciation. You are taking care of that pretty well in the depreciation.

A. Absolutely not a cent.

Q. Here is your distributing system, you are going to depreciate that in 40 years and we have mains lasting for 75 years which will possibly last longer?

A. And on that distributing system they have spent in the last 20 years the full amount which I allowed for depreciation.

Mr. MATHEWSON: The full amount you allowed for depreciation for the distributing system?

The WITNESS: Yes.

Q. They did that by putting out new mains?

A. I am referring to the mains not charged to new mains, but charged for replacements and the like, just exactly as I would do it.

Q. Then, do I understand you to say that in the distributing system they did expend this five million dollars, this five cents?

A. No.

2161 Q. You mean that in their mains——

A. Now you are talking about the reserves.

Q. Let us keep to one subject if we can.

A. Yes, I would like to.

Q. I was not talking about taking care of your mains out of this five cents until you said you were.

A. No, sir, you spoke of electrolysis and asked if I had included that in the depreciation for the mains, and I distinctly said I had not.

Q. Yes, I think that is correct. Then, to this speculative field of electrolysis about which we know nothing, whether it will depreciate or not?

A. I don't know whether you know about it or not, sir, but I do know. I know it is a very serious hazard in the business, very serious. Whereever there are stray currents we expect electrolysis more or less, and there are stray currents in the City of New York.

Q. To that extent my ignorance will correspond to your knowledge, doctor?

A. All right, sir.

The Master: Drop the persiflage and get down to business. What is the question?

Q. My question is that this five million dollars is to take care of explosions and unexpected accidents and fluctuations in business.

A. Fluctuations in prices of labor and all the things that make up a variation in cost, which variations we find all the time happening.

Q. And if a new company was starting in business it would be well for them to have reserve to meet those?

A. Yes, to accumulate to meet them.

Q. But you take now an old company that has been going for years and has had a surplus which it could draw upon to pay dividends when their earnings did not warrant it, would you also tax the public five cents per thousand cubic feet of gas to supply them with an additional reserve fund of $5,000,000? 2162

A. I have not involved any question of surplus. I have simply taken——

Q. I know, but are not these very items that you speak of things that should be taken care of out of surplus if there is one?

A. No, I don't think so.

Q. That is, you think the people for eight years or less should go down in their pockets and pay $5,000,000 to this company in order that they may have a fund for such uncertain contingencies, and not call upon their surplus or stockholders by a reduction of their dividends?

A. That will depend, of course, upon whether they have been drawing full dividends right straight along, and it will also depend upon whether they are going to be allowed to maintain their own business, and whether an arbitrary price is to be fixed, and whether, therefore, an arbitrary price being fixed, they should not be allowed to have a cushion in between the actual present cost and the selling price in addition to return on capital.

Q. Then this five cents, as I understand it, is a defense against depreciation in the selling price of gas, or a decrease in the selling price of gas and a cushion between the Legislature and the gas company?

A. In a measure, yes.

At this point a recess was taken until 2:15 P. M.

2163 After Recess.

Alexander C. Humphreys resumed the stand.

Cross-examination by Mr. Page continued:

Q. Doctor, you were to have made a computation as to what 2.50 per hundred dollars of depreciable value of the plant at 4 per cent. compound interest would amount to for forty years?

A. Yes, sir. That is $238.09.

Q. At the end of forty years by investing your 2.50 in the business and reinvesting the earnings at 4 per cent. in the business you would have at the end of the forty years 2.38 times the depreciable value of the plant.

A. No, sir. It is a different proposition entirely when you put it that way. If we took the 2.50 and placed it outside of the business in a sinking fund where we did not have the use of it, then it would amount to that money, but if they do as I said where I used the 2.5 we would simply have year by year not only the active current depreciation taken care of, the current renewals made, but we would have the final renewals paid for, currently, either by renewals or by plant investment to offset it. There would be no opportunity for accumulation in that sense.

By Mr. Kirby:

Q. Doctor, in the table you have put in evidence, pages 1943 and thereon, you have put in as a depreciation factor a figure which is based on this 2.50 which you have figured in the way you have stated, have you not?

A. I have put in such an amount to be at once paid out for renewals or reinvested as an offset to the current undetermined depreciation. In other words, the accruing depreciation. In other words, I do not let it accrue. 2164

Q. Whether you let it accrue or not it is for the purpose of taking care of that unseen depreciation which you said will so affect a plant like that of the Consolidated that in forty years an amount will have to be expended to keep it up to its present value.

A. Equal to its present value, no. Expended right there at that time.

Q. At what time?

A. Year by year, provided always that my premises are correct, that the business is an active one and such amounts as are not required for the current renewals can at once be actively put into plant as an offset to that accruing depreciation.

Q. And if this amount were not obtained from this fund you speak of, where would it be obtained from?

A. I don't know. I have never thought of such a contingency.

I have always worked on the principle that I must include in my cost not only the cost items which were made apparent by demands for payment, but accruing liabilities and that undoubtedly must be kept intact in that regard.

By Mr. MATHEWSON:

Q. Included in what cost, cost of gas?
A. Yes, sir cost of production.

By Mr. KIRBY:

Q. Do you know what course the Consolidated Gas Company has pursued prior to this time?

A. As far as I understand, to paying for their future renewals and not setting aside any definite sum until of late, when they set aside a sum of ten cents to cover that and many other items.

Q. And in current renewals did they include such renewals and all renewals which you consider are to be covered by your depreciation factor? 2165

A. They covered as I understand all such renewals as became apparent to them at the time currently but they did not take care of accruing and undeveloped necessities.

Q. And your factor is to take care of such accruing and undeveloped necessities is it not?

A. Certainly.

Q. And that amount if not obtained from the consumer that is from the price paid for gas, would have to be obtained from new capital, would it not?

A. If you like to look at it so. I should say it would be obtained from the depreciation of the capital already invested. In other words, you would impair your capital to that extent but it would not be new capital.

Q. So no moneys would have to be expended? If it were merely an impairment of the present capital no new moneys would have to be furnished to meet these expenditures?

A. Certainly there would be. You have got to keep the plant up. First or last you have got to keep your investment unimpaired.

Q. And so if it were not obtained as I said before from moneys received from consumers in the price paid for the gas it would have to be obtained either from the reserve fund if the same existed or if the same did not exist from new capital invested in that business?

A. No, I should not put it that way. It would be obtained from new money brought into the business but it would not be from my standpoint new capital. I should not feel warranted in considering it new capital. I should simply consider it money obtained somehow to repair losses I had made.

Q. And not new capital being received it is not an extension of the present business?

A. Not an extension, no, sir.

2166 Q. Now, this fund which you would obtain in some way, whether from an addition to the cost, either from the consumer in the price he paid for gas or in a loan or in some manner you desire or you state it is advisable to invest in the gas making business, do you not?

A. I work on the theory——

Q. Answer the question.

A. I will answer it just as I please. You cannot answer a question for me.

The Master: Repeat the question.

(Question repeated.)

Mr. Page: I ask that the question be answered yes or no. I think it is capable of such an answer.

A. No.

Q. According to your theory as set down in the statement to which I have referred, in what do you suggest or recommend that such moneys be invested?

A. To commence with, as I have tried to explain, you won't have the money to invest. As has been shown by my testimony you would only have a limited portion of it because I not only include in my 2½ per cent. the amount to cover accruing depreciation, but I also cover the amount which is actually expended from year to year; and I therefore state that in addition to the amounts which are so expended currently and have been expended currently for the past twenty years, the additional amount, part of the 2½ per cent. will be not invested for I do not consider that the correct term, but will be put into plant as an offset to the value of that accruing depreciation of the plant already established. The total investment will not have been changed.

2167 Q. In other words, this 2.5 factor when used, is to be used not only to take care of this depreciation about which you have testified, but also to take care of current renewals; that is, to keep the plant in proper repair and condition, or do I misunderstand your testimony in that regard?

A. I am sure I don't know what you do. The 2½ per cent., according to the figures that I have prepared, have nothing to do with the repairs, as shown on that page of my statement, but it does include the amount expended in addition to repairs, for renewals and replacements as made. In other words, if they take the repair amount which I include and also this 2½ per cent. amount and add them together, it is my estimate of what the difference between that amount and the amount actually expended for repairs, current renewals—the difference between those two is what I estimate as necessary to put in for deferred renewals.

Q. Then do I understand you in saying that these current renewals, that is, the sum expended therefor, would be expended out of the depreciation fund, however, the same might be invested?

A. Certainly, sir. That is what it is for.

Q. And the proper amount to set aside for that purpose, whether they take place this year or next year or at any period in the life of the company will be sufficient if it is based upon a two and one-half per cent. basis?

A. Upon the basis of the figures that I obtained from the Consolidated books for repairs, if I add to that an amount which is indicated by the two and one-half per cent. on the depreciable property I shall have an amount which in my opinion will keep the property at par value from year to year.

Q. Then two and one-half per cent. in itself would not be sufficient?

A. Certainly not.

Q. What would be sufficient?

A. I have indicated it.

Q. Will you show where it is?

2168 A. The total per cent. will be about 5.4 per cent., including not only current repairs, current renewals, but deferred; in other words, total maintenance.

Q. That is based upon the experience of the Consolidated Gas Company for the past twenty years, taking into account the current renewals as shown in one of their exhibits, referred to in your statement, appearing on pages 1943 and following, you consider them an addition to the amount they have spent yearly for repairs for the upkeep of their plant, that they should have set aside a sum reckoned at 5.4 per cent. on the amount invested in their gas business to take care of this depreciation factor about which you have testified?

A. Certainly not.

Q. Then what would the 5.4 take care of?

A. It would take care of what I understood you to ask me. If on the basis of my statement it required 2.5 per cent. to take care of renewals in addition to repairs, 5.4 is what it would require in per cent. to take care of the total up-keep.

Q. And what do you include in the total up-keep?

A. Repairs, current renewals and final renewals.

Q. And are those items the ones which your depreciation fund would be used for?

A. No, sir.

Q. Which of them would it not be used for?

A. It would be used for the total renewal, including the amount as shown in the books as having been spent for the last twenty years.

Q. Well, is that not what I have said in regard to the 5.4?

A. No, sir.

Q. Wherein is the difference?

A. I cannot follow your reasoning, Mr. Kirby. It is not it at all. If you are going to ask questions you can draw out anything you like from them.

Q. Well, you know what we are trying to get at?

A. I am sure I do not. Lord knows if I knew it I would tell you right off and save the trouble.

2169 Q. I think we can come to an understanding?

A. Personally, I doubt it.

Q. You desire to set aside a certain fund?

A. I don't desire to set aside a certain fund at all. Right there we do not understand each other.

Q. You recommend in this statement that a certain amount of moneys be taken from the earnings of the company for the purpose of caring for depreciation, is that true?

A. Quite.

Q. You state on page 1949 as follows:

"My estimate therefore is not made up on the exhaustion of the plant by actual rust or by anything of that kind, but what I believe, all things considered, the life of the plant, when the plant will have to be renewed by reason of exhaustion of life. In this case I have taken what figures out to be almost exactly forty years, and I take 2½ per cent. therefrom as the right amount for forty years, and I take 2½ per cent. on the depreciable property, and having found the amount I divide it by the amount of sales and show a cost per thousand as we have in this statement."

A. Quite correct.

Q. Does it not follow from that statement that the 2½ per cent. which you recommend to be set aside is for the purpose of taking care of those things which you mentioned; that is, not exhaustion of the plant by act*aul* rust or anything of that kind, but by reason of the exhaustion of the plant, giving it a life as you estimate, 40 years?

A. In part you are correct.

Q. In what part am I in error? That is what I am trying to get at.

A. I am not offering any suggestion to set aside a fund—on the contrary, I have tried to maintain all along not to set it aside, but to put it back into the plant.

2170 Q. Well, we will assume that it is put back into the plant. My first inquiry is directed toward whether or not that 2½ per cent. item is a correct item to be used for this depreciation, to which I have just referred, and outside of such repairs due to rust and other things, which you may also have reference to?

A. No, sir; repairs due to rust, &c., if we can detect them, are included in the repair account, but not included in that 2½ per cent., for renewals which are made currently and all other things which tend to shorten the life of a plant or tend to terminate its life, rust and everything included; but rust we would probably detect from time to time, and that would be charged to repair account.

Q. It would not be paid out of that 2½ per cent. account?

A. No, not what we could detect; what we could detect we would repair.

Q. I think we understand each other on that score.

A. I do not know whether we do or not.

Q. I assume that we do.

A. I do not assume it. I have had very little indication that you understood it.

Q. I have a very good indication that you quite understand it.

A. Yes, I understand that perfectly.

Q. Now then, we go on: We take this 2½ per cent. and you desire that that shall be invested in a certain way, and recommend it be invested in the plant itself in some way, don't you?

A. For a specific answer I should object to the words invest or re-invest.

Q. Should be expended in the plant?

A. That is better, yes.

Q. And if I understand your testimony correctly, you have taken 2½ per cent. instead of 1.05, because while 1.05 is put aside in a fund bearing interest at 4 per cent. and the compound interest would bring the original back in 40 years——

A. (Interrupting.) If you waited that long.

2171 Q. Yes, if you waited that long; but this money, if expended in the plant, would bring back a larger and greater return; am I right in that?

A. Not necessarily, no, sir.

Q. Then why, if it will not bring back a larger and greater return, do you recommend its being expended in that way?

A. To keep the return up to par, keep the property investments to par from year to year; to maintain it, not to increase it.

Q. In other words, this 2½ per cent. is not to be expended in any part in the extensions of the plant?

A. Extension to the extent necessary to represent the depreciation of plant not yet determined by exhaustion.

Q. True; so that the first year the chances are that a certain part of this 2½ per cent. could be expended in extensions?

A. I have not the faintest notion whether it could or not; it would depend on circumstances, perhaps the very first year something would happen and you would have to spend it all in renewals. If you will take in the meaning of "Deferred Renewals" you will understand.

Q. Yes, deferred renewals. You may expend a large part of this depreciation fund; your stoking apparatus may become antiquated, and you may have to replace it with another apparatus and expend maybe more than you have set aside in your depreciation fund for this year, which might balance off the next or succeeding years, and which in 40 years would bring the amount which you state, according to your opinion, is a proper amount; but if we assume that that amount is not expended the first year, then what do you do with the balance, the difference?

A. I assume that the business, being an active one, there will be opportunities to put money into new plant, as an offset to depreciation, and having done so that depreciation is paid off right
2172 there and then, and all such amounts as are expended during 40 years, and all such property depreciation as so paid off, will at the end of 40 year- be taken as an offset to this accruing depreciation.

Q. So that if you were fortunate enough to be able each year to expend that money in new plants, and the next year the amount which you set aside was not sufficient, you would capitalize the amount you spent in new plants and raise the money to pay for this extraordinary expense?

A. No.

Q. Upon what then would you call for the funds to make this renewal?

A. Make a temporary financial arrangement.

Q. In other words, you would borrow money or take it from your reserve, if you had it?

A. Possibly.

Q. And this money which you have invested in new plant will bring a return which you state is somewhere more than 4 per cent. I am right, am I not?

A. In the long run, yes. I also stated that you would not do it in the first years.

Q. Even with the Consolidated Gas Company?

A. Yes.

Q. And it is invested in the making business, is it not?

A. Yes.

Q. And at no time have you counted upon a 4 per cent. return, have you?

A. No, sir.

Q. Then, if the company was fortunate enough to have been able to take care of its renewals by the expenditure of its current repair fund and had done so during this period of forty years, it would have two plants, would it not, each of the value of the original plant?

A. Of course, if you want to suppose such a case—I never heard of one—you would in a measure, have two plants, yes. You would have the old plant for what it was worth at the time, and you would have the new one.

2173 Q. And the new plant from its inception would be bringing back such returns as a gas plant would be expected to bring in the community in which it was operating, maybe starting with less than two per cent. because new, and building up to four per cent. or thereabouts as it became older?

A. That is on the basis of your being able to make your renewals for some sum much less than it cost.

Q. No.

A. That is the way I understand the statement, that you are able to keep up the plant by simply expending a certain amount for daily renewals.

Q. That is it, whatever they cost?

A. No such condition could exist, in my opinion.

Q. I have assumed that it does exist, when I ask the question.

A. Well, I won't answer it, I think, because I give a good deal of thought to the questions as they are put to me and I do not give much thought to these hypothetical questions outside of my experience.

Q. You could certainly state what you consider a new gas company should earn on the capital invested in a gas making business, could you not?

A. Yes.

Q. What do you think that should be?

A. I think it ought to earn ten per cent. on the investment in the business, averaged up.

Q. And that on each addition to the investment and extension, finally, so that if we had a plant that started out with two and one-half million dollars in the beginning that would earn ten per cent. its first year—or do you consider it should earn ten per cent. the first year?

A. No, I should not.

Q. What should you consider?

A. It would depend too much on circumstances. I do not like to generalize. I managed a company once that did not earn a cent for four years and had a handsome good will later on.

2174 Q. Take it over a period of 40 years, you think it ought to earn 10 per cent.?

A. Yes.

Q. And that 10 per cent. will be on the total investment that had gone into the plant during that period?

A. Yes.

Q. Figured from the time of the investment to the end of the 40 years?

A. Yes; not on the reinvestment covering depreciation.

Q. Not on the re-investment covering depreciation; that is my understanding. Now, this 5 per cent. reserved for contingencies; you are not prepared to state how you think that ought to be invested or used?

A. I do not think it makes much difference as long as we have the amount of reserve as a cushion.

Q. You would consider that if it were put into extensions of plant or a new unit added, that would be proper business management?

A. It would temporarily take the place of moneys that would otherwise have to be brought in.

Q. A new unit would be an extension of plant, would it not?

A. Not necessarily.

Q. You consider the Astoria plant is an extension of the Consolidated Gas Company, do you?

A. Yes.

Q. And you consider this 5 per cent. reserve might properly be invested in that plant, would you not?

A. Temporarily invested until needed, when they so defer the day for borrowing money for that.

Q. And when needed capital would have to be obtained from other sources to take its place?

A. That is right.

Q. And put into the Astoria plant in place of that which you take out, for the purposes reserved and set aside?

A. That is one way.

Q. And you expect this 5 per cent. invested in the Astoria plant would be earning as much return as is reasonably to be expected from a plant of that kind?

A. Yes.

2175 Q. And then, if a company had the good fortune to have created at the end of forty years a plant of the same size as that which it started with, out of this depreciation fund, paying for those renewals which would otherwise have to be taken out of depreciation, out of its current repair account, you would have a plant of twice the value of the original plant, would you not?

A. If you were able to take from what I call, for present purposes, my final renewal fund of 2½ per cent., and you were able to keep up the present plant, not only in full working order, but so as to take care of all exhaustion of life, and also build a plant of the same value, you would of course have a plant of double value.

Q. And that plant would have been paid for without any increase of capitalization of the company?

A. Yes, sir.

Recross-examination by Mr. BURR (continued):

Q. Doctor, is it customary in scientific and technical works where pressures of the atmosphere or gas are given, to give them at sea level, and at a temperature of 60 degrees Fahrenheit?

A. It is sometimes done in laboratory work; I have never heard of it being done in ordinary gas practice.

Q. Do not scientific experts, reading and using those figures invariably deduce from these standard figures the pressure of gases — higher or lower levels?

A. Certainly not.

Q. Or, to put it another way, when scientific data as to pressures of the atmosphere or of gases are given and no level is fixed or mentioned as compared with the sea level, is it not usual to accept those atmospheric gas pressures at the sea level?

2176 A. In scientific work, where we are making comparisons with different localities, and it is scientific work, we do read it in that way, but in the gas business and in a certain locality we do not make such corrections.

Q. Why don't you accept that situation in the gas business?

A. Because we have one locality to deal with and we are not making comparisons with other localities. Apart from the cases I have stated that I have never heard of it being done, where we take the pressures as we see them, sometimes for the purposes of corrections of volumes and so on, we take in these different factors. But in our ordinary readings of pressure we take just what I have stated, the readings on the gauge, because those are the practical pressures that we have to deal with, and others we do not deal with. We do not have to.

Q. Not even where there are knolls and vales?

A. Certainly.

Q. Have you seen the report attached to the Investigating Committee of 1885?

A. 1885?

Q. Yes.

A. I cannot recollect whether I have or not.

Q. If you will look at this, which purports to be a report on the pressure of public lamps of the several gas companies, as reported in tenths of inches, as recorded by lamp pressure registers January 7th, 1881, and see whether they do not figure upon the difference between sea level and various elevations stated.

Mr. **Mathewson**: I object to this. The witness is asked to look at some document to see if somebody else did not figure on some basis.

Mr. **Burr**: He says it was never done by gas experts, in the gas business, and I want to show that it was done by the experts for the city as far back as 1881.

2177 A. I should not consider that as being in the gas business, any more than I should consider the Stevens Investigating Committee as in the gas business. I was talking about practical results.

Mr. **Kirby**: It accomplishes results.

The **Witness**: It does not accomplish results, if you have a certain figure and then try to figure it out by taking another one.

Q. That purports to be a report of the Bureau of Gas and Lamps, January 7, 1881?

A. That is right. I am simply not willing to accept that as indicating practice in the gas business. It is simply the report of a bureau chief, or something of that kind. He may have had some reason for reporting in that shape; but what we have to deal with is the pressure that we find, irrespective of any calculations or deductions that we cannot make in practice, or under conditons that we have not to deal with.

Q. It was evidently intended to get the pressure at various points?

A. I am trying to see if it does. I will look at it for a moment and study it.

Q. Certainly; take all the time you want, Doctor.

A. Is there anything here that says it is pressure in tenths of inches after correcting for difference in level? I may be very stupid, and it may be that it is figured out so, but I do not see here any indications in the titles of the columns or anything of that kind that there were such corrections made. It may be, possibly.

Q. Does it not show the distances and the elevations from the level?

A. Yes.

Q. That these pressures are taken?

A. Yes, but it does not say that these pressures have been corrected for that; it does not say so. It may be so, I do not know. It may be that the pressures were reported as found. It is not a very conclusive report.

Q. On an inspection of that table which is attached to Dr. 2178 Mark's affidavit in this case, and which appears on page 45 of the affidavits submitted by the City of New York in opposition to the motion for injunction *pendente lite,* is there not such a statement?

A. Not the slightest, that is stated there.

Q. Assuming the specific gravity of 22 candle-power to be .65, would not a rise of 100 feet add a half inch approximately to the gas pressure?

A. Assuming the specific gravity to be .65 would not a rise of 100 feet add approximately five-tenths?

Q. A half inch, to the gas pressure?

A. Yes, my recollection is that it is .517, which is approximately half an inch, and would reduce the pressure for a like fall.

Q. In the matter of pressure, the variation is the main thing, is it not?

A. That is right.

Q. And the variation of the law which is now under discussion here is one inch, is it not?

A. The variation allowed is between one inch and two and one-half inches.

Q. Would not a law limiting gas pressure to one inch minimum and two and one-half inches maximum, if a half-inch pressure of water column were added to each of those pressures for each one hundred foot rise or *vice versa* practically be more easily fulfilled?

A. Yes.

Q. If this allowance of a half inch per hundred feet were made, would not any difficulties or variations of pressure arising be due entirely to the irregularity of consumers' demands, or to the size of mains used?

A. No, not entirely; there are other things that enter in. For instance, there are atmospheric disturbances which give us the same factors for difference.

Q. Well, *if* I do not say entirely; but I say mainly?

A. Yes, largely.

Q. If difficulties as to variations of pressure in any districts arose, would it be practically possible, allowing one-half of an inch 2179 rise per one hundred feet, or fall, to correct it by properly apportioning or distributing the mains to the demands of the customers?

A. We could take the demands of the customers for any one day and proportion the mains, so as to get a result of that kind; but demands vary from day to day and year to year, and demands for whole districts vary, so that the mains laid out for a certain district would be entirely upset as to design perhaps within a year or two. For instance, you might have mains designed for A to burn so many thousand feet in a given hour, and the same hour B should burn so many thousand feet, and so on, and might be within the law. Those conditions might change. A cigar factory might shut up, and others might be started in another district, and your conditions are changed at once, and the pipes that were designed to fill the conditions at one time would not fulfill them at another, without variation. That is absolutely so. Of course, the differences between winter and summer are also so widely divergent that you can not possibly cover that by any fine design, and the actual practical experience of gas engineers is not to attempt to do that, except in an approximate way, and then get down by actual experience and correct the troubles as they come up.

Q. Is it not one of the fundamental principles of gas engineering to keep down the pressure?

A. Yes, to a point where its consumers will get a sufficient supply for their appliances, the result being that of late years the demand is for a much higher pressure than when I first went into the business.

Q. What is the reason for that, in your judgment, for that change?

A. Well, you need hardly put it my judgment. It is simply the fact that since I have been in the gas business that the appliances brought in require higher pressure than they did in the older days, when they practically used argand and flat flame burners, 2180 and the superintendents of the works were nearly all hipped on the idea of keeping the pressure down to a minimum to reduce leakage, so that they would dissatisfy the consumer, and I frequently had to threaten my superintendents with discharge for the reason that they would not carry high enough pressure to supply the gas stoves and other appliances because they were either afraid there would be an excessive leakage and that I would blame them for that.

By Mr. Mathewson:

Q. Welsbachs also had something to do with it?

A. Welsbachs, as I have mentioned before, Welsbachs and stoves, require from one and one-half to two inches pressure, whereas in the old days we could get along if we could get inside the house with .7.

By Mr. Burr:

Q. But if the mains are sufficient for the maximum demand, will they not be equal to the lesser demand?

A. Yes, sir.

Q. Is it not true that in London the law requires that the gas pressure shall be tested at street lamp-posts and .1 inch water column shall be deducted for decreased pressure at service pipes?

A. The law demands that there shall be tests for pressure made, and they are penalized within certain limitations if they go below the minimum, but there is no limitation as to maximum pressure.

Q. Is it not true, as I have stated?

A. Will you state the law again?

Q. That the gas pressure shall be tested at street lamp-posts and .1 inch water column shall be deducted for decreased pressure at service pipes.

A. I don't remember having read that of late, but it sounds right.

Q. Mr. Bradley has testified that in some streets there 2181 are ten mains, and Mr. Simpson testifies also that three and four mains are frequently found in some streets. Is not this an exceedingly costly form of gas distribution?

Mr. Mathewson: He has not testified that that number of Consolidated Gas Company's mains were found in the same street. You are mixing them up with the other companies.

The Witness: I should say it was hardly possible from my information. I do not pretend to know all the mains, but I should hardly conceive it was possible. I have made a particular study of mains and I have watched the main distribution in New York more than the Consolidated Gas Company knows about, and have seen more than they think.

Q. Assuming that condition to exist, that would be an exceedingly costly form of gas distribution?

A. Certainly.

Q. If you were as an engineer requested to elaborate an adequate main distributing system with the least capital outlay, how would you go about it?

A. I should study the physical conditions of the city and I should then make a very careful study of the present distribution by areas and streets and then lay out my pipes and take care of that business, bearing in mind, of course, that those areas would be apt to change widely so I would have to lay out a wide margin throughout the general distribution system. Then I should be largely influenced by the conditions as to pavements, and even more perhaps—by the obstructions I should find in the street.

Q. That is in the bed of the street?

A. In the bed of the street. I should then lay out the mains decidedly with an eye to the future, because it would not pay 2182 me probably to rip up those streets again even if I could get my pipes in, so I should very carefully think of that, as the difference on that additional investment would not equal the expense of going into it later on.

Q. And that is all you would do with that proposition before you?

A. I should do every thing that a man could think of to influence my opinion as to the future distribution demands.

Q. Would you under the condition of least capital outlay put in two pipes or one pipe in each street?

A. If you will permit me, I prefer to answer that, that I should probably in New York City decide almost invariably to put in two pipes, because I should not only take into account capital outlay, but operating expense, which would involve, by the way, capital outlay also. I should want to avoid crossing the streets as far as possible and keep my mains on each side of the street. That is my present impression with regard to New York City.

Mr. Page: To avoid crossing the streets for services?

The Witness: Yes.

Mr. Mathewson: Especially if you had a subway down in the middle of the street?

The Witness: I had that in mind, yes.

Q. Mr. Simpson has testified that 795 miles of mains are active and 27 miles dead or not in use. Do you know the sizes and street locations of those 27 miles of dead mains?

A. No, sir.

Mr. Mathewson: He has not testified it was dead main. He said it was not in use.

2183 Q. Would not two pipes of a capacity equal to one large pipe cost more than one pipe?

A. Yes, sir.

By Mr. Kirby:

Q. There is just one question I would like to ask. On page 1946 of the testimony it is stated final renewals, depreciation, production, manufacturing, 4.9795. Distribution 1.5797, totaling 6.5592 cents.

A. Yes.

Q. What factors did you use in producing the figure for production of 4.9795 and distribution, 1.5797?

A. I used the factor given by the basis of 33 years life on works and 60 years on distribution, which, as I stated in my estimate, figure out practically 40 years for the whole plan.

Q. Did you use that 40 years for the production and distribution?

A. No.

Q. Did you use the 30 years——

A. I used the 33 years for production and 60 years for mains and distribution, and all that; in other words, the years that I took for the production being the same figure as Prof. Bemis uses for all.

Q. And what values did you use upon which you made that calculation?

A. That I gave you, you know, this morning. I will give it to you again, $21,829,591.17 for the production as they call it and $12,589,827.21 for distribution.

Q. The production including the $7,500,000 required at Astoria?

A. Yes.

Redirect examination by Mr. MATHEWSON:

Q. You stated in reply to Mr. Burr that two pipes which combined would carry the same volume of gas would be more expensive than one pipe. On the other hand, after two pipes were in, 2184 would not the expense of maintenance be less?

A. Certainly, that is what I would do it for.

Q. Your judgment would be that that would more than offset in New York City the advantage accruing from one large pipe.

A. Certainly, or I should not do it.

Q. Mr. Kirby has asked you a hypothetical question and asked if upon that basis you would not have a double plant in 40 years if his premises were carried out. Did you in your experience or practice ever know of such a case as he outlined in the hypothetical question?

A. No.

Q. Do you think that judging from your own experience and knowledge of the business that such a situation would be possible?

A. No.

Q. You said something in your cross-examination in reference to your not constructing gas plants in the United States. Have you ever constructed any here?

A. A great many—we are still supervising such construction.

Q. And installed water gas apparatus.

A. We do not in the United States, now instal water gas apparatus. We supervise the installation.

Q. Are you familiar with it?

A. Very.

Q. And also coal gas apparatus?

A. Yes.

Q. What in feet or atmosphere is this pressure of 1½ inches or variation of 1½ inches pressure?

A. Do you mean pounds to the square inch?

Q. Yes.

A. 54/1000 of a pound to the square inch about.

Q. You said that in London there was no limitation as to maximum pressure, only a limitation as to minimum?

A. Yes, sir.

Q. Do you know of any place where there is a limitation as to minimum?

A. I do not, except this.

Q. And "this" means New York City?

2185 A. New York City. Let me see, does not the law extend to more than New York City.

Q. No.

A. Manhattan, yes, New York City.

Q. When you gave the formula with the long radical sign at the outset of your cross-examination, did that relate to a single pipe straight of the length which you gave?

A. Yes.

Q. With no services off?

A. Yes.

Q. When you discussed the question of trunk mains in the street and the establishment of distribution areas or districts, did you take into consideration the question of whether it was possible to lay trunk mains in the streets of the city of New York by reason of the present sub-surface structures?

A. I certainly took into consideration the whole question, but I was not asked that.

Q. If it be true that in many streets of New York or some of them it would be impossible to lay more mains or larger mains, that would be an answer at once, would it not, so far as that goes?

A. Yes, certainly.

Q. If a system of trunk mains such as was suggested to you was to be installed, or an effort made to install them, would that be a matter of considerable time and considerable expenditure or not?

A. Trunk mains or separate district mains?

Q. Such as Senator Page asked you in reference to when he was discussing running trunk mains through the streets?

Senator Page: I did not ask him anything about trunk mains.

Mr. Mathewson: Oh, yes.

A. He referred to district mains, I believe.

Q. Well, such mains as he referred to as you understood it.

A. Of course it would take time and very large expenditure in view of the present conditions of the streets of New York.

2186 Q. And after these districts had been established, considering the change in consumption, would it in your judgment, even then be possible within each district to provide that the pressure will never be more than two and one-half inches and less than one inch and still deliver the gas to your consumers in proportion for use?

A. It would not.

Q. And if the mains were to be cut off in districts, so each district would stand by itself, would that not eliminate on the other hand the running in of gas from various other sections, which tends to unify the pressure in them?

A. It could neutralize that element. Each separate system would have to stand upon its own feet.

Q. In reference to mains and services, did you hear Mr. Simpson's testimony since your direct testimony, that the book figures of $1,212,071.09 for services and $7,852,151.03 being the book value for *mains* was a low valuation based upon his estimate of the original cost of installation even?

A. Yes, I recall something of that kind.

Q. Did you consider that subject?

A. I did.

Q. And what was your conclusion?

A. My conclusion is that it is a low estimate for the value, under those conditions.

Q. Eliminating the present book value?

A. Eliminating absolutely.

Mr. Page: I should not say that that was an estimate. It is a fact.

Q. In reference to the cost of replacements of mains, you have testified you think the figure of $12,600,000 and odd is less than it would cost to replace. What in your judgment would be the cost of replacing the 795 miles of active mains, excluding the 25 miles of mains which are not abandoned but not at the moment in use?

A. I believe it would cost fully that sum under present conditions.

2187 Q. The entire $12,600,000 and odd?

A. Yes, sir, fully that.

Q. Would you consider it good judgment to supplant the benches of sixes with nines in the company's gas plants?

A. Not under present conditions. I should want them to wear out more than they had at present.

Q. Will you take your statement of the cost of gas aggregating 70.947 cents and say whether the 14.145 cents is the 2½ per cent. allowance regarding which you have been testifying?

A. Whether that is it?

Q. Yes.

A. No.

Q. Is the 14.145 cents included in the 2½ per cent.?

A. Yes, certainly.

Q. Now, how much of the 14.145 cents did you say was actually expended in renewals and repairs during the past 20 years on the average?

A. 10.6 cents.

Q. That would leave how much of that 14.145 cents?

A. 3.545 cents.

Q. Will you deduct that from the 65.947 cents which you state to be "Cost at burner with no reserve as yet included to cover contingencies" and say what the remainder would be?

A. 62.042.

Q. That would represent the actual expenditures then?

A. Yes, sir.

Q. Now, Mr. Addicks testified in reference to the additional requirements for enrichment due to the change in candle-power and to a sum to equalize the labor for this year with the preceding average was as follows:

Enrichment	1.83 cents
Labor	.78 cents

The sum of those I make to be 2.61 cents. Now, do I understand that you include in the five cents under the heading "Reserve as explained in Note" such items as the difference in the cost of material by reason of the change of candle-power? 2188

A. Certainly, that is what the reserve is for.

Q. Now, will you add that amount of 2.61 cents to the last figure 62.402 cents which you said was the actual expenditures?

A. 65.012.

Q. Then assuming these two items of Mr. Addicks to be correct, that would make 65.012 actual expenditures quite aside from any reserve whatever, would it not?

A. Yes, averaging the repairs.

Q. And the difference between that and your total of 70.947 or between five and six cents would be left for final renewals and contingencies and other items which you have testified to?

A. Yes.

Q. Now when you speak of depreciation or final renewals, am I right in understanding that you do not mean wearing out of the plant so much as necessity of plant or supersession, as you call it, readjustment which may require the disposition of part of the plant before it is worn out?

A. I take all those into account.

Q. The extinction of life, as you call it, does not mean the wearing out of the apparatus?

A. No, I may not wear out, but may get run over by a trolley to-day.

Q. May I ask whether your estimates in this regard are based upon your own experience as well as upon your study?

A. They are.

Q. You have said that you require pressure to operate Welsbachs and stoves of 1½ to 2 inches inside the house. Is there any loss of pressure between the mains and house pipes or these apparatus?

A. Certainly.

Q. To what extent?

A. There is the pressure required to pass the gas through the meter. The meter itself is a machine that is operated by the pressure of the gas, and naturally absorbs pressure and absorbs from .2 to .5. You cannot reckon on less than .5, when you are running the house to capacity. Then in your pipes in the house, supposing we have ideal conditions, we will have all pipes laid out according to schedule, which starts with the hypothesis 2189 that there will be a loss of pressure of .1 of an inch for each 50 feet of run. Then you will have your bends included, of course, in that case.

Q. You were asked in reference to booster systems, or mentioned them in your cross-examination. What is a booster system?

A. It is a term I rather imagine borrowed from our electric light friends. It is a pipe run under a higher pressure than ordinary distributing pressures, and not connected or should not be connected, although they are connected sometimes, to the consumers, with the idea of carrying the pressure from the distributing point to some outlying point, and there to boost the pressure at that particular point where it is attached to the distributing main. It is a reinforcement of pressure by independent system of pipes.

Q. That was the subject on which Senator Page examined you?

A. He did examine me a little, sir.

Q. Are you familiar with any booster system such as those in Milwaukee and St. Louis so as to know how they operate?

A. I am fairly familiar with both of those.

Q. What is the result there, if you know?

A. They are helping the condition of affairs and reducing the variation of pressure, and St. Louis, for instance, is laid out with the idea that they will ultimately be able to keep within 3.2 inch maximum pressure, that is, they hope they will be able to do it.

2190 Q. Are they accomplishing keeping within the limits of 1½ inches pressure, if you know?

A. Do you mean 1½ inches variation?

Q. Yes.

A. I think not. They are certainly not keeping within the limits of two and one-half maximum pressure.

Q. When you testified in reference to your estimate of the value of the mains of the company, either upon original cost of installation or cost of reproduction, were you using the knowledge of Mr. Simpson or were you using your own knowledge and experience?

A. I used both to the best of my ability.

Q. But where you found that your estimates did not agree with his, whose did you accept?

A. I used my own.

Q. So that to all intents and purposes it is fair to say that it was your own estimate?

A. Certainly.

Q. Taking the mileage of mains as given?

A. Taking the mileage of mains as given. That is my basis for saying that I think the estimate is too low.

Q. Have you made any investigation or have you any information that the system of distribution of the Consolidated Gas Company is not economical?

A. I have not.

Q. Considering the situation in New York to-day, Doctor, with your knowledge of it, and assuming that you were to lay out a system of distribution to best meet requirements as was suggested on your cross-examination, is it your belief that it could be installed to-day for less than the sum which Mr. Simpson has testified as the reproduction value of the mains in New York?

A. With $12,000,000?

Q. Yes.

A. I have never made, as I testified, a complete engineering investigation of that large problem, but from my present knowledge I have not the slighest doubt that to install such a plant under 2191 the conditions as they exist to-day would cost very considerably more than twelve millions of dollars. I have not the slighest doubt of it.

Q. Do you know whether in making that estimate, there was taken into consideration the extraordinary street obstructions, such as the subway and the electrical conduits for the trolley roads along the centers of the avenues?

A. No, sir. And that was one of the faults I found with the estimates.

Q. Those things would have to be taken into consideration if you were installing a system to-day, would they not?

A. Yes, certainly.

Mr. Mathewson: That is all.

By Mr. Page:

Q. You say there is a certain pressure at the meter which is less than the pressure in the main—I mean past the meter?

A. Yes, there is an absorption of pressure in the meter, that is right.

Q. A further absorption of pressure of .1 of an inch for each 50 feet of pipe?

A. Well, there probably is a good deal more than that, but I state, to be conservative, that the ideal condition in the house which would follow the laying of the pipes in the house according to these rules would show .1 inch if we used the gas according to which that schedule is laid out. In other words the schedule is based upon the falling off in pressure of .1 for each fifty feet. Of course it does not always fall so, because they do not use enough gas to reduce it .1, but we have to be prepared for it.

Q. Would not the same element of increase of pressure by increase of elevation also follow in the house pipe as it would in the street pipes?

A. Yes.

2192 Q. And your meter is as a rule in the cellar?

A. Yes.

Q. So that as you go on up in the house you have gained in the same proportion as you have given here for gain or elevation?

A. Yes. I considered more especially the first level of a house, which we have to think of. We have to think of the worst conditions as well as the good ones.

By Mr. Burr:

Q. What advantage outside of short services would be gained by a double line of pipe or mains?

A. The mere shortness of the service would not be much of an item. It is avoiding having to cross the street with the very expensive work you would have by reason of ripping up pavements, running under conduits and the rest of it, obstructions in the street.

By Mr. Mathewson:

Q. Senator Page has referred to the use of governors and district governors for the control of pressure in the distributing system. Would it in your judgment be possible for the rate of flow through the governor and the pressure at the outlet of the governor to remain constant and still have the pressure along the line of pipe covered by that connection to vary?

A. Yes.

Q. Would it be possible to have such variations under the conditions named as to be at a given point sometimes within the law and sometimes outside of it?

A. Yes.

Q. And not indicated by the governor at all?

A. Yes.

2193 William Halpin, called as a witness on behalf of the complainant, being duly sworn, testified as follows:

Direct-examination by Mr. Garver:

Q. You are a member of the State Board of Tax Commissioners of this State?

A. I am.

Q. Are you Chairman of that Board?

A. Since the first of January, this year.

Q. How long have you been a member of that Board?

A. Since early in March, 1904.

Q. As a member of that Board did you take part in the valuation of the special franchises of the Consolidated Gas Company for the year 1906?

A. I did.

Q. Do you recollect that those franchises were valued at some $31,900,000?

A. That is the figure.

Q. In your opinion was that a fair and reasonable value for the franchises?

A. It was.

Q. The State Board assesses the special franchises of Public Service Corporations throughout the State?

A. All those occupying the public streets and highways for a greater distance than 250 feet in those streets and highways.

Q. Will you mention the different companies whose franchises are thus assessed by the State Board?

A. Railroad companies, steam and street.

Q. Railroad companies—does that include steam and trolleys?

A. Yes; telephone and telegraph companies, gas companies, electrical subway companies, water companies and oil pipe lines; and we assess a number of scales in the streets used by private people. That comprises about all the assessments that we make.

Q. Did you mention water companies?

A. Water companies.

2194 Q. Have you taken part in the assessment of special franchises of those various companies throughout the State since you have been a member of the Board?

A. Since I have been a member of the Board, yes.

Q. In making the assessment of the special franchises of the Consolidated Gas Company for the year 1906 did the Board consider the report of the company, a copy of which is now shown, marked State's Exhibit C?

Mr. Burr: Objected to as incompetent, irrelevant and immaterial.

The Master: He may answer it.

Exception taken by Mr. Burr.

A. The Board considers all the reports submitted to it when it determines the assessments, tentatively and finally, and it considered the reports made by the Consolidated Gas Company when it made the tentative valuation and when it made the final valuation of that company, this year.

Q. In this report, State's Exhibit C, the present value of the property in the streets, allowing for depreciation, is given. Do you remember whether the Board accepted that statement of value or whether it fixed an independent value upon the tangible property?

A. My recollection is that the members of the Board have considered that the present value of the tangible property of the Consolidated Gas Company and its constituent companies has always been under valued, and we have increased the valuation of the tangible property, and that is reflected in the assessment.

Q. Do you recall approximately the extnet of that increase?

A. No, I do not recall the extent of that increase, but I should say it was not more than from 40 to 50 per cent., but how close to that I do not remember. We have seven or eight thousand of 2195 those assessments to make, so that it is hardly possible to recall the items of any special assessment.

Q. Is it your recollection that this valuation was not increased by the Board more than about 50 per cent.?

A. No, I do not think it was increased more than 50 per cent.

Q. It appears that the final notice of assessment sent out by the Board of the franchises of the Consolidated Gas Company for the year 1906 was dated March 28th. Was that about the date when the assessment was finally fixed by the Board?

A. I do not recall the date when it was finally fixed. I know that the proper legal notice was given to the companies of the time of the hearing, and I know that, the day before those assessments were certified to the Tax Department in this city, the chief clerk in the office brought the list of them to my house and I compared them with the figures I had taken at the meeting of the Board when the assessments were finally made, and compared the certificate as filed with the assessments on the list I had. That was the day before the first of April, or perhaps the 31st of March.

Q. It is in evidence that the first notice sent out was dated some time the first week in March. Would the special assessment have been fixed between those dates, the date of the first notice and the date of final notice?

A. The assessments were finally fixed after the hearing, after Mr. Frank H. Platt was heard with respect to the assessments of the Consolidated Gas Company and its constituent companies, and not until after that.

Q. And that was in March?

A. That was in March.

Q. And Mr. Frank H. Pratt appeared as counsel for the company in objecting to the valuation that had been tentatively placed on the franchises?

A. Yes. Our method is to send notice to the companies
2196 assessed, the notice stating a time for the hearing when they
may be heard if they desire to object to the assessment, and
after the time of the hearing then the assessments are finally made.

Cross-examination by Mr. Page:

Q. The report, State's Exhibit C, is the report of the Consolidated Gas Company for the year ending June 30, 1905, is it not?

A. That is right.

Q. And in making your assessment you made it upon that report, largely?

A. Yes.

Q. As of what date?

A. As of the second Monday in January, 1906, when all taxes are determined.

Q. The Consolidated Gas Company is complaining in the courts of the valuation which you have fixed, $31,900,000, is it not?

A. I do not recall whether *certiorari* proceedings have been begun with regard to this assessment or not, but it would not surprise me if they had done so.

Q. They have as to all previous assessments?

A. They have as to all previous assessments, yes.

Mr. Page: That is all.

Mr. Burr: No questions.

Robert A. Carter, recalled for further examination, testified as follows:

The Master: I believe you had some further cross-examination, Senator.

Mr. Page: No, I had no further cross-examination, but Mr. Carter was to produce an exact statement of the amount of moneys that were drawn from surplus accounts to pay the dividends of 5½ per cent. in 1899 and six per cent. in 1900.

2197 By Mr. **Mathewson**:

Q. Have you the figures here, Mr. Carter?

A. The amount drawn from surplus accounts to pay the dividends as indicated were, in 1899, $705,199.44 and in 1900 $1,116,633.85.

Q. Mr. Carter, yesterday there was put in evidence the record of assessments upon the six constituent companies which form the Consolidated Gas Company for special franchises in the Borough of Manhattan. Do you know whether either one of those companies was assessed for a special franchise in the Borough of Bronx, and if so, which one, and what amount?

A. There was an assessment of $20,000 against the Municipal Company in the Borough of the Bronx, but that there was a special franchise assessment of course, I don't know. I am not aware that that has——

Q. The amount is $20,000?

A. The amount is $20,000.

Q. And that $20,000 with the amount of the assessment for the six constituent companies, as stated yesterday, make up the total of $5,455,000 which you stated was assessments of an additional character?

A. Yes.

Q. Beyond those heretofore existing?

A. That is the case.

Q. In what way, if in any way, do the conditions under which gas is delivered to the city, differ from those under which gas is delivered to the consumers?

A. I am not aware that they differ in any conditions, Mr. Mathewson.

Q. They are made in the same manufacturing plants?

A. The gas is made in the same apparatus, distributed through the same mains, supplied in similar meters and in every other way the supply is identical to that of the consumers.

2198 Q. The conditions so far as you know, are no more favorable than in delivering to private consumers, are they?

A. Not at all.

Q. Complainant's Exhibit 86 shows "Active Meters on district average sales per active meter," and some other items. The question has been raised as to the 795.47 miles of mains shown in the corresponding Exhibit 168 before the Gas Commission. What was the heading of the column on Exhibit 168 before the Gas Commission in which the 795.47 miles appears?

A. Miles of active mains.

Q. And this Exhibit was prepared by you for the purpose among other things of showing the sales per mile of mains?

A. Precisely.

Q. And so mains which were not at that moment connected with services were eliminated?

A. Yes, sir.

Q. Are the balance the property of the company and so carried?

A. Yes, and liable to be put in commission at any time. That happened to be the number of miles out of commission at that time, and it is a constantly changing element.

By Mr. **Burr**:

Q Is it not a fact that in the electric light business that a great reduction is made to a large consumer in the price of electricity—electric current supplied per kilowatt.

Mr. **Mathewson**: I object to that. The conditions are entirely different and it would not affect the question of law before the Master at all, whatever might be the case.

The **Master**: What is the point of it?

Mr. **Burr**: On the question of the supply of gas to the city, I claim that the city being the largest consumer and certain other elements entering into the question, it is entitled to a reduction and has received a reduction and that situation is recognized for years, and it is recognized by the electric light companies in their sales for years. 2199

Objection overruled. Exception.

A. I am aware of variations in the prices charged electric consumers, but I think that it is rather the period that the current is used in twenty-four hours that governs it rather than the volume of it. In other words, given a certain investment in the necessary plant and apparatus and distributing system to reach a customer, and without the storage facility which the gas companies have for storing their commodity, they recognize the advantage to them of having their current used a great many hours during the twenty-four over a short hours' use of it and they recognized that in the price to their consumers.

Q. Even to the extent of charging small consumers twelve cents per kilowatt and large consumers three cents?

Mr. **Mathewson**: Not twelve.

Mr. **Kirby**: Ten.

Q. Well, say ten. You do not require meter checking for the city supply, do you, as you do for the ordinary consumer?

A. Meter checking?

Q. Yes.

A. I don't quite understand your question, Mr. Burr.

Q. Meter reading?

A. Oh, precisely, the same meter reading in the case of the city as in the case of any other consumer.

Q. For the lamp-posts?

A. The gas supplied to the lamp-posts is supplied under contract, and does not come into the question at all, as I understand it.

Mr. **Page**: The city has to pay for it.

Mr. **Mathewson**: Yes.

2200 The **Witness**: Ought to have to.

Q. I asked you the other day for a transcript of the account in the ledger of the transactions in real estate since 1884?

A. That is practically prepared. It took a little time to dig that up, covering 20 years.

Mr. **Burr**: If it can be done, I would like to have the number of services in use December 31, for the years 1895, 1896, 1897, 1898 and 1899.

Mr. **Mathewson**: Requests were made not covering that period and we presented a list of the services, which Mr. Burr has. We prepared it at his request, 1903, 1904 and 1905, and I cannot undertake, now that we expect to close our case in a few minutes, to make up any more statements.

Mr. **Burr**: Then I assume you have supplied all the statements you intend to supply?

Mr. **Mathewson**: I stated the other day quite clearly.

The **Master**: Is that all Mr. Carter?

Mr. **Mathewson**: No.

By Mr. **Mathewson**:

Q. The delivery of electricity is to consumers in proportion to their consumption, and does not distinguish or discriminate, does it, as between the city and individual consumers?

A. No, sir, it does not.

By Mr. **Page**:

Q. You mean by that there is no provision in the law establishing a price that you can charge the city for the public lights, the electric lights?

A. There would not be one that was made voluntarily by
2201 the company as I understood Mr. Burr's question to convey.
If there is such a provision——

By Mr. **Mathewson**:

Q. You are referring to the metered delivery of electricity?

A. I am referring to metered currents, yes, sir.

Colin C. Simpson recalled.

Direct examination by Mr. **Mathewson**:

Q. As to the Consolidated Gas Company mains included in the 822 miles to which you have testified, are there in any case that you know of more than one line of main on each side of the same street?

A. In very few cases.

Q. You testified as to taking 90 per cent. of the pavement of New York as asphalt or new pavement, and you did not figure out exactly how much main of each size was under the new pavement or within the 10 per cent. of the old pavement. From your knowledge of the main system and of the streets, in your judgment is 90 per cent. upon the basis which you figure a fair, a law or a high estimate of the main value within asphalted pavement?

A. It is a very low estimate.

Q. In other words, the small sized mains are under what sort of pavement, that is, a greater proportion as compared with the large size?

A. You would have to put it this way.

Q. Well, put it your own way.

A. That mileage of paved streets is mostly in thickly settled portions of the city where the most mains are, and the other portion of the city where there are many streets not under new pave-
2202 ments, in nearly every case there is only one main on the street, and where the new pavements come in there are generally two.

Q. Would you think the 90 per cent. estimate a conservative one?

A. Very conservative. My first intention was to make it 95 per cent.

Q. And if the mains were taken figured out, showing which were under asphalted pavements, is it your judgment that that figure would be raised or lowered?

A. I think the figure would be very close to 95 per cent.

Q. In figuring the cost of replacement to-day at $12,600,000 and over, did you take into consideration the obstructions offered by the present system and the electrical conduits of the trolley roads?

A. In no instance.

Q. The 10 per cent. which you added did not cover that?

A. No, sir. The reason for that was that I figured that the cost of the alterations for the mains along the line of the system were already paid for by the subway people, and the many thousands of dollars that had been expended for lowering mains under trolley roads had also been paid for by the trolley people.

Q. Then if you were in fact to replace to-day, taking into consideration those items that would add, would it not, a considerable sum to the cost of replacement?

A. A great deal of money.

Q. When you gave the figures for the tax report, were you informed that those figures were to go under the column headed "Cost of Reproduction, New?"

A. I was not.

Q. Were you aware of that fact?

A. I was not. In fact I never knew it at all until last January when I was in court and saw that paper produced here.

Q. The tax report?

A. The tax report.

2203 Mr. **Mathewson**: I desire to offer in evidence Section 522 of the Charter of the Greater New York, Laws of 1901, providing a penalty for failing to maintain a candle-power of 20 candles.

Received in evidence as Complainant's Exhibit 238, but not marked.

Mr. **Mathewson**: I also offer chapter 651 of the laws of 1866, being the Act to incorporate the New York City Mutual Gas Light Company.

Mr. **Page**: Objected to as immaterial and irrelevant.

Mr. **Burr**: I object to it as immaterial, irrelevant and incompetent, and if allowed to go in we will be entitled to show, if we may, what transpired since, so far as that company is concerned.

The **Master**: I do not see that it is very material, but I will take it.

Received in evidence as Complainant's Exhibit 239, but not marked.

Both except.

Mr. **Mathewson**: That completes our direct case with the understanding, as I suppose, that the statements and figures which were testified to, introduced in our statements, have been verified by counsel for the defence, so far as they see fit, and that the fact that the figures are true statements from the original entries may be accepted subject to verification, the same as though the original entries were produced here.

Mr. **Burr**: That is your understanding?

Mr. **Mathewson**: I say I assume that is it. Is that correct?

2204 Mr. **Page**: We do not acquiesce entirely in that understanding.

Mr. **Burr**: It is not my understanding. I would suggest that we adjourn until to-morrow.

Adjourned to September 14, 1906, at 2 P. M.

Last Exhibits:

Complainant's 239.
State's W.
City's —.

2205 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York; **William Travers Jerome**, as District Attorney of New York County; **Frederick E. Gunnison**, **John C. Davies**, and **Lucian L. Shedden**, Constituting the New York State Commission of Gas and Electricity, and **The City of New York**, Defendants.

Before Arthur H. Masten, Special Master.

New York, *September* 14*th*, 1906—2 o'clock p. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Garver, Mr. Page, Mr. Burr, Mr. Kirby.

2206 Mr. **Burr**: I am handed by counsel for complainant a statement purporting to be a statement of gas made for Consolidated Gas Company under agency agreement, net, for the months of November and December, 1905. I understood from counsel yesterday that he had furnished all the information which he intended to furnish, and I ask to have this marked for identification.

Mr. **Mathewson**: Do you offer it in evidence?

Mr. **Burr**: I asked to have it marked for identification.

Marked for identification, City's Exhibit 45.

Mr. **Burr**: At the conference which was held yesterday between counsel and the Master it was understood that to-day, whatever motions were to be made by the defendants, could be made with the understanding that those motions in formal shape might be submitted at a later date, and that an arrangement as to an adjournment would be made to-day. On behalf of the city I move for an order by the Master permitting an audit of the books of the complainant and for an inspection of its plant for the purpose of enabling the defendant, the City of New York, to properly define its action, and that request I understand will be joined in by the State.

Mr. **Page**: We join in the motion.

The **Master**: Well, I do not understand that I would have any power to grant any such motions as these that have been made. At all events I shall deny them, with exceptions to the several counsel.

Mr. **Burr**: On behalf of the city we move to dismiss the complaint on the grounds which I may be permitted to set forth in the formal application for that purpose.

The **Master**: Same disposition.

2207 Mr. **Burr**: And I further move on behalf of the city to strike out the testimony of the various witnesses adduced on behalf of the complainant, on the grounds to be hereafter stated in the formal motion.

Mr. **Mathewson**: I do not see how that motion can be made or considered in that form.

The **Master**: It cannot be passed on in that form. I should dislike to entertain any motion to strike out any part of the testimony without having specified exactly what was covered by the motion, and the grounds in detail. There were certain features in the complainant's testimony, as I recall it, to which that motion might perhaps be applicable. There were certain matters that were received subject to being connected later and with all rights reserved to the defendants to move to strike out testimony which was received at the time against their objections. Of course I cannot pass on their motion to strike out until I have looked into those matters fully, but I see no objection to letting Mr. Burr formulate his motion in writing, it being understood, of course, that nothing in connection with his motion shall operate to delay any proceedings or extend the time of adjournment or anything of that sort. How long do you want, Mr. Burr, to put that in writing?

Mr. **Burr**: The record is not yet complete showing the complainant's case, and of course that would be necessary before we could properly formulate all the grounds upon which I desire to make the various motions. I might inquire of the stenographer when he expects to have the exhibits furnished *in toto* to counsel for the defendants.

The **Stenographer**: Next Tuesday.

2208 Mr. BURR: I shall require about five days after that to get my motions in such shape as I desire to present them to the Master.

The MASTER: Of course if it should transpire that any part of Mr. Mathewson's case is stricken out in consequence of that motion, before his case can be deemed finally rested, he will be entitled to an opportunity to make good any deficiencies which will have to be on such an arrangement as to time as may be fair and right under the circumstances, and if you take additional time now to the extent you indicate for the purpose of preparing your formal motion it must be without prejudice to any of his rights.

Mr. BURR: I think that would be fair.

Mr. MATHEWSON: If the motion were made now and something were stricken out I should expect to fill the gap if any material gap was left. I do not know what the motion may be. I am unable to act.

Mr. PAGE: On behalf of the State I will say, I had understood that an arrangement was made yesterday that the motion to dismiss the complaint and the motion to strike out such portions of the proof as we deemed advisable were to be submitted in writing; there would be no meeting and no hearing upon it and entry upon the record. Of course if we had expected to present to-day the motion, we should have asked yesterday for a *single* extension or adjournment to allow us to go through the record and prepare our motion with some degree of care. I expect to make a motion to strike out certain portions of the testimony and also a motion to dismiss the complaint and had supposed it would be done in
2209 that way, that I would submit a motion in writing and serve the other side with copies of the motion.

The MASTER: I suggest that that be done without any meeting.

Mr. PAGE: Yes. And if the Master should strike out any portion of the testimony he could make such disposition as seemed just to him to all the parties, and if he should dismiss the complaint of course that would dispose of any other motions.

Mr. BURR: I understand we may submit these motions without a formal hearing?

The MASTER: Yes; sending a copy to the other side and a copy to this office by the end of next week.

Mr. PAGE: Of course that does not interfere with the time in any way, shape or manner.

Mr. MATHEWSON: I did not wish to interrupt Brother Burr's motions, but it seemed to me they were a little premature in view of the fact that we have not as yet rested our case, but we were to meet here to-day with a view of putting the record in such shape that we could rest it. I do not know that I have anything to offer that will affect his motions, and I have no objections to their standing as though made at the conclusion——

Mr. BURR: I certainly understood that the case was closed yesterday.

Mr. MATHEWSON: I don't see how you could after the discussion in the Master's room. We desire a ruling from the Master on one point to be given in advance.

Mr. Master: Statements or compilations were presented in regard to certain matters by the complainant from the books and records of the company with a view to facilitate the hearing all around, 2210 as I understood it, and they were received with the understanding that the defendants should have an opportunity by their accountants to verify the accuracy of the compilations by examining the books at the company's office instead of bringing them down here, and repeatedly when Brother Burr asked for various data he said he might not require the data if the examination of his accountants covered the point. The accountants for the defendants went to the company's offices; they were there for a long time and they completed their examination of the complainant's books for the purpose of verification on August 23, 1906, and they have not been there since. I understood it to be the arrangement that if the defendants were given this opportunity for verification that would dispose of their objection that the original books were not presented here, in lieu of the compilations, and we thought we were facilitating the hearing by that method, that having been found to be in previous investigations the only practical way to get at the result within reasonable time.

Mr. Burr: I dispute that statement.

Mr. Mathewson: Just a moment, I have not completed yet. This examination having been made by the experts of the defendants, no objections having been raised to these items, I would like the ruling of the Master as to whether the objections have not been complied with, or rather the conditions upon which the testimony was received. It seems to me that is a point on which we should have something on the record.

The Master: Now, Mr. Burr, what were you going to say?

Mr. Burr: The counsel has repeatedly stated what pre- 2211 vious investigations found was the proper thing to do. I know nothing of what previous investigations have found to be proper. What they did, not being in evidence here, can have no bearing upon the present situation. You remember that this inquiry had not been an hour in progress when I called attention to the fact that an audit of the books of the company and an inspection of the plant would facilitate a proper inquiry such as this was intended to be into the affairs of the company, and counsel for the complainant reminded me that if I desired to prove my case I must take and prove it in the legal way and they had no intention of entering into any stipulations whatsoever.

Mr. Page: Well, it seems to me, if the Master pleases, that it is proper we should make some statement as to what our accountants did do and then the record stands, if such be as the record discloses was the case and how we availed ourselves of it. If we should have gone farther I suppose we have got to take the responsibility, or if the ruling was not sufficient to meet the legal requirement the other side must take the responsibility. They have closed their direct examination and we closed our cross-examination, and as to the fact I am willing to admit that the accountants for the State have examined the entries appearing upon the ledger and journal of the Consolidated Gas Company for the year 1905 and for the nominal year ending October 31st, 1905, and found that the compilations made therefrom as appear upon exhibits 93, 94, 95 and 96 correspond with the books.

The **Master**: It may very possibly be that any statement
2212 in the nature of a ruling from me such as Mr. Mathewson requests would be properly deferred until the formal motions which counsel intend to make are submitted, for possibly the intention of counsel may be to include in those formal motions, especially the motions to strike out what Mr. Burr referred to, and all these questions as regards production of books and the inspection of the books at the office of the company. However, in advance of any such motion, I will state my position in the matter as now advised. Those statements in the nature of tabulations or compilations showing the substance of entries on the books of the Consolidated Gas Company were received as I think the record clearly shows, subject to examination and verification by the defendants. They were received with the express statement and recognition on my part, and on the part of counsel as well, I think, that they were not the best evidence and that under a strict application of rules of proof the complainant would be required to produce here the books from which the tabulations were made up, not only in order to establish the main propositions for which the complainant was contending, but also for the use of counsel in cross-examining. Of course it would have been possible for the complainant to introduce those tabulations in the first instance, calling some witness who could make proper proof that they were abstracts or compilations prepared by him showing the result of a long series of accounts, but the books necessarily must have been produced here to substantiate them in case counsel required. Now those books were evidently of such enormous bulk—I do not mean the individual volumes, but I mean the record of a year's business of a corporation as large as
2213 this was so voluminous that it would be manifestly very burdensome for counsel to examine them here and it would have protracted the hearings to an unwarrantable degree. Under those circumstances and for those reasons the arrangement was made which I assumed would, after it had been working awhile, prove to be a harmonious and satisfactory one to all counsel, that these experts should examine the books at the office of the company, calling for such details as they required. I stated repeatedly that if necessity for any particular book should be apparent and a foundation was laid for I should require its production and in so far as particular books were required they have been produced and the record so shows. I have been advised from time to time that the experts of the State have been in the office of the complainant, making these examinations, and that the experts for the city, as a matter of convenience to themselves and to avoid unnecessary duplication had deferred their examination until after the State's experts had finished, in the idea that possibly when the State's accountant had completed his work there would be very little independent work that the city's expert would want to do. Now there has been no case made out here

before me by application, formal or otherwise, for the production of any books or papers that have not been actually produced. I do not recall any such instance now, excepting the case of some pay-rolls which Mr. Burr called for and which I said I would not order produced unless some better reason was shown than had then been made apparent, nor has any application been made to me to make
2214 any order or take any other action based on the fact that the experts, had not been allowed every reasonable facility at the office of the company to make such examinations as they saw fit, and the fact that they have been now absent from that office and the hearing has been in progress for several weeks since and nothing heard on this subject rather inclines me to the view that the defendants have not suffered any especially trying hardship for lack of information as to this documentary evidence in the defendant's office and, therefore, my present view is that for those reasons I should be inclined to deny your motion to strike out this evidence in so far as it depends upon the competency——

Mr. PAGE: We had not made any such motion.

The MASTER: I understood Mr. Burr did.

Mr. BURR: Yes, I did.

Mr. PAGE: I understood this was a ruling for the advice and instruction of Mr. Mathewson as to where his case stood in the mind of the Master. Of course I am not offering stipulation on Mr. Burr's motion.

Mr. BURR: That is the ruling of the Master, and we will have to abide by it, I suppose.

The MASTER: Gentlemen, I think you are all perfectly protected on the record by exceptions, and everybody's position is perfectly plain. Mr. Mathewson proved his case in the way that commended itself to him, and everything has been made the subject of proper exception, and I do not think there can be any doubt about it.

Mr. PAGE: I think it fair that we should make that statement, that our accountants had been there, so there would be no question as to the fact

Mr. MATHEWSON: If a motion were to lie or to be seriously
2215 considered now to strike out our evidence on the ground the original books have not been produced, then the whole purpose of the arrangement we have made with counsel would go for naught, and instead of having facilitated it for either of us, it would have been simply a waste of time. I could not have conceived that that had been the purpose of the arrangement, that in spite of any inspection the objection should be available for advancement that the original books had not been produced. The Master will remember that some of them were produced, and how it was perfectly apparent in reference to one or two of them that it would be impossible to make any progress if examination item by item were to be had before the Master. A half a day was consumed going over items in a single book, adding and subtracting. Naturally, viewing the stipulation as I did and other counsel of the complainant, we do not desire to leave the case in any doubt upon that subject.

The **Master**: Well, Mr. Mathewson, what is the situation? Do you rest?

Mr. **Mathewson**: Well, I am confident that an examination of the record will show that the purpose and effect is as I have stated. I will supplement that for a moment by asking Mr. Carter to take the stand and I will ask him some questions.

Robert A. Carter, recalled for further examination, testified as follows:

By Mr. **Mathewson**:

Q. Did the experts for the city and State come to the office of the Consolidated Gas Company early in August and ask to ex-
2216 amine the books in relation to the statements which the complainants had put in showing the figures from which those tabulations and statements were made up?

A. Yes, sir.

Mr. **Page**: Am I to understand then that Mr. Mathewson refuses to receive the concession as to the facts that I have made?

Mr. **Mathewson**: No, I do not. I am simply asking this as a preliminary question to show other things.

Mr. **Page**: If he does, of course we will have that stricken from the record.

Mr. **Mathewson**: No, I do not reject that at all.

Q. What facilities were these accountants given for examination of the books showing the transactions of which such statements were compilations?

Mr. **Page**: That is objected to as immaterial and irrelevant and having no bearing upon any of the issues and in the light of the record, being entirely foreign to any inquiry before the Master.

The **Master**: Mr. Mathewson, I hardly think it profitable to go into that.

Mr. **Mathewson**: Very good.

The **Master**: Of course, I can simply indicate my views and sustain the objection, and the evidence can go in, but it seems to me that the record is all right as it stands.

Mr. **Mathewson**: With the Master's suggestion, I will not press this question.

Q. Have you here the original operating ledger from which the compilations of the results in 1905 were presented in Exhibit 94?

A. Yes, sir.

Q. Will you produce it?

A. I have the book here.

2217 Mr. **Mathewson**: This book is marked Complainant's Exhibit 97 for identification, and I offer it in evidence.

Book received in evidence and marked Complainant's Exhibit 97 in evidence.

Q. Have you the station records of the Consolidated Gas Company for 1905 of the material used, &c.?

A. Yes (producing books).

Mr. Mathewson: I offer in evidence the 14th Street station records produced by Mr. Carter.

Book received in evidence and marked Complainant's Exhibit 240.

Mr. Mathewson: I also offer in evidence the 42nd Street station record for 1905.

Book received in evidence and marked Complainant's Exhibit 241.

Mr. Mathewson: Of course I offer only the year 1905. Some of these books cover a longer period, that is, some portions of them. I also offer in evidence part of the 42nd Street records for 1905, which is contained in this volume.

Book received in evidence and marked Complainant's Exhibit 242.

Mr. Mathewson: I also offer in evidence the record of the 21st Street station.

Book received in evidence and marked Complainant's Exhibit 243.

Mr. Mathewson: I also offer in evidence the record of the manufacture of the 44th Street station for the year 1905.

Book received in evidence and marked Complainant's Exhibit 244.

Mr. Mathewson: Also the record of the 99th Street station for 1905.

Book received in evidence and marked Complainant's Exhibit 245.

2218 Mr. Mathewson: I also offer in evidence the portions of the sundry debtor's blotters Nos. 13 and 14, covering the year 1905, relating to the city's account and the sales of residuals, scrap and other material relating to the production of gas for that year.

Books received in evidence and marked Complainant's Exhibits 246 and 247.

Mr. Mathewson: I also offer in evidence that portion of Sundry Debtor's Ledger No. 3, relating to the accounts of the City of New York on the sale of residuals, scrap and other items relating to the production of gas for the year 1905, the volume being Complainant's Exhibit 100 for identification.

Book received and marked Complainant's Exhibit 100 in evidence.

Mr. Mathewson: I also offer in evidence those portions of Sundry Debtor's Blotters Nos. 11 and 12, relating to the same matters for the same period.

Books received in evidence and marked Complainant's Exhibits 248 and 249.

Mr. Mathewson: I also offer in evidence the portions of Sundry Debtor's Ledger No. 2 and Sundry Debtor's Blotters Nos. 15 and 16, relating to the same accounts for the year 1905.

Books received in evidence and marked Complainant's Exhibits 250, 251 and 252.

Mr. Mathewson: I also offer in evidence the Trial Balance Sheet of the company in its original balance book No. 5, for October 1, 1905—This is found on pages 92, 93 and 94.

Books received in evidence and marked Complainant's Exhibit 253.

Mr. Mathewson: I also offer in evidence record of gas sales No. 5, so much of it as covers the sales for the calendar year 1905.

2219 Book received in evidence and marked Complainant's Exhibit 254.

Mr. Mathewson: I also offer in evidence the operating journal for the year 1905, being Complainant's Exhibit 98 for identification.

Book received in evidence and marked Complainant's Exhibit 98 in evidence.

Q. Mr. Carter, were the compilations and tabulations which are comprised in statements presented before the Master made from the books of the company in your control?

A. Yes, sir.

Q. Were they true and accurate compilations and tabulations from the books?

Mr. Page: I would object. It seems to me that this is going over the same ground we have been over before. It was testified they were made up as compilations from the books of the company, and he offered then in evidence.

The Master: That is sufficient, I think. I suppose Mr. Mathewson is asking that in view of the motion made by Mr. Burr.

Mr. Mathewson: I was not exactly clear whether I asked that question. I think I have before, but I repeated it for further assurance.

The Master: I will take it, although I think you asked it.

A. Yes, sir.

Q. I think you also stated you were familiar with the books and frequently tested them and that they were accurate statements of the accounts of the company?

A. If I have not already stated it, I state it now.

Mr. Mathewson: I would like to offer in evidence City's Exhibit 45 for identification, being the last two months of 1905.

2220 Paper received in evidence and marked Complainant's Exhibit 255.

Mr. Mathewson: O[illegible] case is closed.

Mr. Page: If the Master please, I think that under the circumstances, my concession not having been accepted by the complainant, should be withdrawn and stricken from the record.

Mr. Mathewson: I do not think that, because I depended upon that in presenting these. You stated that a certain examination was made and I stated that I accepted that and from that point I desire to show certain other things.

Mr. Page: But instead of that you have gone on and put all your books in evidence.

Mr. Mathewson: Not instead of it at all.

Mr. Page: I do not wish to be precluded by any concession I made to save you the trouble of doing that, from any rights I might have now that the books are all in evidence.

Mr. **Garver**: Your concession would not affect the city. We put it in against both, of course.

Mr. **Mathewson**: I do not think the concession you made is at all prejudicial to the situation as I can see.

Mr. **Page**: But it is not well to cumber the record with the offer of a concession that is not accepted.

Mr. **Mathewson**: I stated expressly that I did accept it.

The **Master**: If the Senator on second thought wants to take back his concession and have it stricken from the record, he is entitled to do so. I do not think it is any different one way or the other. As you say, your concession did not bind Mr. Burr. They had to do what they were going to do against Mr. Burr in view of his notice of motions. If you prefer it that way, it may be striken out. 2221 & 2222

Mr. **Mathewson**: Do you wish to withdraw it?

Mr. **Page**: Yes.

Mr. **Kirby**: Will you note the time of adjournment?

The **Master**: Yes. At the request of the defendants, the hearing is adjourned to October 1st, 1906, at 11 A. M., which I believe was the date arranged.

Adjourned to October 1st, 1906, 11 A. M.

Last Exhibits:

Complainant's 255.
State's W.
City's 45.

2223 *The Corporation Counsel serves on the Attorneys for the Complainant herein, September 27, 1906, the following notice:*

On behalf of the defendant, The City of New York, I make the following motions:

I.

I move to strike out all evidence of the value of real estate at this present time, more particularly the testimony of Wheelock, as the basis of computation must be the amount invested in said real estate, that is, the cost thereof, and not the present value, where such present value is admittedly greater. That is to say, the complainant is not entitled to dividends on the appreciation.

II.

I move to strike out evidence of the value of all such real estate as is vacant, or not used in the manufacture of gas in Manhattan, by the claimant, more particularly as follows:

Rented Parcels.

No. 326 Avenue A.
No. 328 Avenue A.
No. 330 Avenue A.
No. 333 Avenue A.
No. 335 Avenue A, City lot occupied by foreman.
No. 329 Avenue A.
No. 605 West 44th Street.
No. 606 West 44th Street.
No. 608 West 45th Street.
No. 610 West 45th Street.
No. 421 East 60th Street.
No. 420 East 61st Street.
No. 222 West 65th Street.
2224 99th Street and First Avenue (part occupied by foreman).
325 Avenue A, between 17th and 18th Streets, Avenue B and Avenue C, eight City lots.
Between 18th and 19th Streets and Tenth Avenue and marginal street, five City lots.
South side of 111th Street, west of First Avenue, two City lots.
Shadyside, New Jersey.
One-half 41st Street Station.
Also all other parcels not actually used by complainant in the business.

III.

I move to strike out all deeds offered and received in evidence as to the title to Astoria property. All evidence as to moneys spent or to be expended thereon, on the ground that such property or money is not used in the manufacture of gas at the present time, and should not be included as part of the capital on which the plaintiff is entitled to dividends. Such investment in the property and plant at Astoria is not shown by complainants to be essential to the manufacture and supply of gas at the present time in the Boroughs of Manhattan and The Bronx, and is not so used at the present time and in no case should such investment be allowed as part of the capital prior to the time such plant is in operation.

And upon the further ground that such property is owned by and is for the use of a separate corporation, to wit, the Astoria Light, Heat and Power Company, not a party to this action.

Exhibits 50, 51, 52, 53, 55, 56, 57A, 58, 59, 61, 62, being deeds from various parties to the Astoria Light, Heat and Power Company.

Exhibits 54 and 60 being letters patent to the Astoria Light, Heat and Power Company.

2225 Exhibit 63, blue print of property conveyed to the Astoria Light, Heat and Power Company.

IV.

I move to strike out all evidence as to the value of "good will" or the "going value," on the ground that it forms no part of the capital; and cannot exist with regard to a business that enjoys a monopoly, since where there are or can be no competitors, the value thereof ceases.

V.

I move to strike out all evidence introduced as to the cost of gas and the value of investment where the same consists of statements alleged to be taken from the books on the ground that the said statements are not shown to be correct transcripts or extracts of the books, etc., *to the knowledge* of the witnesses, or compiled by them and not the best evidence, but merely hearsay.

VI.

I move to strike out Plaintiff's Exhibit 70, which purports to be schedules of appraisement and valuations of the constituent companies forming the basis of consolidation, on the ground that it relates to plaintiff's machinery and equipment existing in 1884, much of which does not exist to-day, having been superseded and replaced, and relates to equipment which is out of date and not adequate for present purposes in the manufacture of gas on an economical basis, and further, said statement is not a fair statement of values of the property therein appraised, as it does not show on its face that the element of depreciation has been considered in giving the values therein stated; that it is not the best evidence of the value of 2226 the property therein appraised at that time, in that such values could and should be shown by the entries in the books of the respective constituent companies, with an additional allowance for depreciation, and that such appraisements do not represent the cost to the complainant of the property therein specified, but represent the estimate of the values of the property in 1884, which estimate is unfair and biased, and does not make allowances for the appreciation in the value of real estate and the depreciation in the value of the plant and machinery.

VII.

I move to strike out plaintiff's Exhibit 71, on the grounds stated in paragraphs V. and VI. and on the further ground that it includes and purports to be the value of a franchise at that time, which value, if it existed, forms no part of the capital to be used as a basis in determining the rate at issue in this proceeding.

VIII.

I move to strike out Exhibits 72, 73, 74, 75, 76 and 77 on the ground that such increases of stock are immaterial, irrelevant and incompetent and do not show necessarily any increase in the investment on which the Company is entitled to dividends, but which increases in stock have been used for other purposes not incident to the manufacture of gas at the present time in the Boroughs of Manhattan and The Bronx by the complainant.

IX.

I move to strike out plaintiff's Exhibit 78, which purports to be the real estate, plant, property and construction, as shown from the balance sheet of November 11, 1884, and December 31 of 2227 each of the following years, on the ground stated in paragraph V., and on the further ground that the figures for the year 1884, $37,971,419.01, are subject to the objection stated and referred to in paragraph VII., and upon the further ground that such Exhibit includes items and expenses not connected with the manufacture of gas by the complainant in the Boroughs of Manhattan and The Bronx.

X.

I move to strike out plaintiff's Exhibit 79 on all of the grounds set forth or referred to in paragraph IX. herein.

XI.

I move to strike out plaintiff's Exhibit 80, which purports to be a statement of assets and liabilities, on the grounds stated or referred to in paragraph IX.

XII.

I move to strike out plaintiff's Exhibit 81, which purports to be a statement showing the investments in the gas business, on all of the grounds set forth or referred to in paragraph IX., and upon the further ground that the following items in no wise enter into the investments of complainant for the purpose of the manufacture of gas in the Boroughs of Manhattan and The Bronx; "invested in gas manufacturing plant at Astoria, $556,000; invested in cartage plant, $50,000; proceeds from debentures, $12,717,494.64."

XIII.

I move to strike out plaintiff's Exhibits 85 and 86, on the grounds stated in paragraph V.

2228

XIV.

I move to strike out plaintiff's Exhibits 87 and 88, which purport to be certificates of incorporation of the Astoria Light, Heat and Power Company and the National Coke and Coal Company, on the ground that said companies are not parties to the present action and cannot be included in the capital of complainant.

XV.

I move to strike out plaintiff's Exhibit 89, which purports to be a comparatively condensed balance sheet, on grounds set forth in paragraphs V. and IX., and on the further ground that it contains securities of other companies not parties to this issue, amounting to $53,041,134.52, and securities of the Astoria Light, Heat and Power Company amounting to $5,560,000, and of the National Coke and Coal Company, $50,000.

XVI.

I move to exclude plaintiff's Exhibits 93 and 94, on the grounds stated in paragraph V, and upon the further ground that the items for coal and oil represent purchases from parties who are directly interested in the capital stock of the Gas Company, and that said items are not a fair estimate of the cost of coal and oil, and on the further ground that the statements include items for gas stoves bought, sold and leased, separately from production and sale of gas, and upon the further ground that the charge for street lamps is no part of the cost of the manufacture of gas, and on the further ground that the item of contingent expenses and depreciation, amounting to $1,114,236.00, is excessive and not warranted by the conditions and is no part of the cost of the manufacture of gas, and on the further ground that there are expenses for clerks and employees included in said statements, which persons rendered services to other companies and for other purposes not incident to the manufacture of gas by the Complainant in the Boroughs of Manhattan and The Bronx, and on the further ground that such statements include contributions to Employees' Aid Association, taxes and interest on taxes which have not been paid and which are the subject of litigation at the present time, all of which form no part of the cost of gas during the period in question; and on the further ground that the estimate of fixed charges, amounting to $936,883.24 does not represent the actual interest on charges pertinent to the investment of the complainant in the manufacture of gas in the Boroughs of Manhattan and The Bronx. 2229

XVII.

I move to strike out plaintiff's Exhibits 95 and 96, on the ground stated in paragraph V, and on the further ground that such exhibits are made up of totals containing items in no wise connected with the manufacture of gas by the complainant in the Boroughs of Manhattan and The Bronx during the periods covered by said exhibits.

2230 *The Corporation Counsel serves on the Attorneys for the Complainant herein, September 27, 1906, the following notice:*

The defendant City of New York moves to dismiss the complaint of the complainant herein on the following grounds:

I. We submit that the complainant has wholly failed to prove its contention that Legislative enactment reducing the selling price of its gas to eighty cents per thousand cubic feet to private consumers and seventy-five cents per thousand cubic feet to the City of New York, is a practical confiscation of its property, in that it cannot manufacture and sell its commodity at such prices and render an adequate return to the capital invested in its business.

It appears from the testimony that the complainant is not only a manufacturer and seller of gas, but that the major portion of its invested capital is devoted to an investment in the stocks and bonds of other lighting corporations, owning them in entirety or so nearly so as to be able to dictate their policies; it also loans from its ample funds to those companies and notably to one of them, the Astoria Light, Heat and Power Company, *without charge for interest;* it has furnished millions of its capital and is pledged to supply millions more for the construction of a gas plant in a locality where it has no legal right to operate itself, and as a result of all of these transactions, and by introducing statements covering all its operations, some of which are shown not to be remunerative, it has sought to prove that the purely gas making branch of its business will be unprofitable under the present law.

2231 *We are able, however, by the use of figures introduced by the complainant itself, which we accept as accurate only for the purposes of this motion and deny for any other purpose, to show, that upon the basis of its operations for the year 1905, and considering its capital invested solely in the business of making and selling gas, it can supply gas at 80 cents per thousand cubic feet to private consumers and 75 cents to the City of New York, with a reasonable profit when all the circumstances and conditions are given due consideration.*

Investment in the Gas Business.

The first question to consider is the amount of money which the complainant has invested in its legitimate business of making and selling gas.

Complainant stated in Exhibit 80, under the heading, "Investments in the Gas Business," that it has so invested the sum of * * * $56,891,454.99. But that is manifestly incorrect, because it includes therein two items of its investment in the securities of other companies, namely, the Astoria Light, Heat and Power Company and the National Coke and Coal Company, the aggregate of these two items being $5,610,000.

Counsel for the complainant very properly stated (Testimony, page 1059) that,

"The amount invested in other securities we do not claim a right to earn upon from the consumer of gas."

Such is our own position and, however, for its own purposes of accounting, the complainant may see fit to treat the two corporations above referred to, the sum of $5,610,000 is, in law and in fact an "amount invested in other securities" hence, cannot be an investment in the gas making business of the complainant.

2232 The items on said Exhibit 80 of

"Material and Supplies"	$616,470.08
and	
"Due from Consumers and Others"	2,000,000.00

must also be eliminated from consideration, for the reason that they are much more than offset by the item on the other side of the account entitled:

"Accounts Payable and Accrued Charges" $3,281,711.52

This latter item is not an investment of the complainant, nor a sum upon which any interest has to be paid.

In the ordinary course of its business it covers the cost of materials and supplies remaining on hand at the close of the year, together with a still greater amount of the same which it has converted into gas and sold; in any event, it is not an investment of the complainant, no interest has to be paid for its use and there is no good reason why it should be so treated, as, in effect, to charge the consumers of gas with a cost for interest which does not have to be met in the first instance by the complainant, nor to allow a profit to be made thereon.

Taking then the total assets shown by Exhibit 80 to have been invested in the gas business......		$56,891,454.99
and deducting these items:		
Plant and Property, Astoria......	$5,560,000.00	
National Coke & Coal Co.........	50,000.00	
Material and Supplies...........	616,470.08	
Due from Consumers and Others...	2,000,000.00	
		8,226,470.08
There is left as a remainder..............		$48,664,984.91

2233 From complainant's own showing, therefore, the total amount of the funds which it has raised from the sale of its stocks and bonds, which is now invested solely in the gas business and upon which it is entitled to earn an amount sufficient to pay whatever rate of dividend the Legislature and the Courts shall find to be reasonable; and such further sum, if any, as shall judicially be determined is wise and proper to be kept in a Sinking Fund for future contingent use, is less than $49,000,000.00.

That this is substantially the correct sum invested in the gas business we may readily substantiate by arriving at a result closely approximating this, from a different method of figuring, which perhaps may be more readily understood:

Assuming for the purposes of this motion only that the original capital of the Complainant Company was	$39,073,000.00
Add Debenture Bonds Issued in 1888...........	1,387,000.00
The Insurance Fund........................	286,809.84
Consumers' Deposits	904,520.07
Additions to Plant and Property in excess of the last three items...........................	7,115,235.99
	$48,771,565.90

Secretary Carter testified (at pages 392 and 572) that the original capital provided for more than a million dollars of working capital and in one form or another it must still exist as such.

Exhibit 79 shows that from the date of its organization to October 31st, 1905, it had added to its permanent investment in plant and property,

The sum of	$9,693,565.90

We have assumed, for the purpose of accounting, that the funds to pay for such addition came in part from the sources 2234 itemized and that the remainder came from surplus profits or from premiums received from the sale of its stocks and bonds, but, as a matter of fact, it is not important from what source the funds were derived.

All money received by the complainant goes into one treasury account and is finally, and we assume accurately, accounted for.

It will be seen, then, that one method of figuring

Produces	$48,771,565.90
And the other	48,664,984.91

But from either sum there must be a deduction for a matter which does not appear upon the books of the company, but which is in evidence, namely, the disposal of a portion of its property and plant to the City of New York, and hence its release from the capital invested in the gas-making business.

Not all of the property so condemned and taken over by the City of New York has had a price fixed upon it by the proper tribunal, but awards have been made upon the following property:

Land and structures at 111th Street	$365,000.00
Part of land and structures at 18th Street	485,748.00
Bulkhead property at 21st and 22d Streets	247,853.00
As to much the larger part of the property taken at 18th Street no award has yet been made, but an extremely conservative estimate is	672,952.90
A total of	$1,771,565.90
Deducting from the capital investment shown to be	$48,771,565.90
The value of the property sold	1,771,565.90
There remains	$47,000,000.00

which is the utmost amount entitled to earn dividends from 2235 the gas business on the basis of the complainant's own figures.

Result of Gas Operations for the Year 1905.

No evidence has as yet been introduced which will show the exact cost of making and selling gas separate and apart from all the other business of the company, and we have no purpose at this time of making such a showing, but rather to follow the line adopted by the complainant, and consider as a whole its business for the year 1905.

On the one hand, we shall set down as receipts only those items shown by the complainant as being derived from the gas business, and as operating expenses shall allow those only which are to be fairly considered as a proper charge from the standpoint of the consumer.

Complainant's Exhibit 96 shows a total of receipts from "Gas Sales," $13,552,482.97.

As a matter of fact, these receipts were not all from the sale of gas, but were in part from the rent of gas stoves and for the maintenance and care of street lamps; there are items of income also pertaining to the gas business which in Exhibit 96 are included in "Miscellaneous Income."

There was sold in 1905 (see Exhibit 94) 13,283,163,767 cubic feet of gas, of which there was sold to the City an estimated quantity of 398,525,978 cubic feet, leaving for private consumers, 12,884,637,789 cubic feet.

The price in 1905 being one dollar per thousand to the latter and ninety cents to the former, we must deduct twenty cents and fifteen cents respectively to reduce the figures to those that would result from an enforcement of the present law.

2236

12,884,637,789 c. f. at 20 cents	$2,576,927.56
398,525,978 c. f. at 15 cents	59,778.90
Total	$2,636,706.46

Receipts (Exhibit 96)	$13,552,482.97
Deduct, as above	2,636,706.46
Receipts under present law	$10,915,776.51
To this should be added from "Miscellaneous Income":	
Rentals, wharfage, discounts, scowing, suspense accounts, etc.	172,710.53
Total income from investment in gas business	$11,088,487.04

From Exhibit 94 we take the following items of expenditures which enter into the cost of making and delivering gas, selling and collecting for the same:

Station cost	$3,455,091.37
Cost of gas manufactured under Agency agreements	997,039.89
Total distribution, less interest on consumers' deposits, which will be included in the general expense item of interest	1,589,690.67
	$6,041,821.93

This sum, reduced by repairs to gas stoves and by street lamp account ($345,213.44) we submit as the cost of making, selling and delivering gas, keeping the gas accounts and collecting the bills and based upon the quantity of gas sold, amounts to 42.88 cents per thousand c. f.

2237 The General Expense items, which we also take from Exhibit 94, are as follows:

General Office Expense (90%)	$305,992.36
Automobiles, (90%)	4,557.74
Advertising and Legal (90%)	95,220.02
Vacations and Sickness	8,175.20
Real Estate Rents	42,674.71
Gas Companies' Aid Society	6,413.99
Superannuation	14,943.86
Insurance	54,031.83
Renewals (Actual Exhibit L.)	232,219.67
Taxes	738,067.86
Interest	118,918.37
Total General Expenses	$1,671,215.61

Summary.

Gross Income		$11,088,487.04
Gas Cost	$6,041,821.93	
Other Expenses, Interest and Taxes.	1,671,215.61	7,713,047.54
New Earnings		$3,375,449.50
6% Dividend on Actual Capital Invested		2,820,000.00
Surplus		$555,449.50

The surplus may be carried in a fund to provide for all extraordinary renewals, repairs or contingencies, as to which testimony has been admitted and which fund is largely in excess of any sum which past experience has shown is needed.

We have treated the General Expense items shown in Complainant's Exhibit 94 with great conservatism in making a division of the amount that should be borne by the capital of the company invested otherwise than in the gas business. 2238

When it is considered that the complainant owns all or nearly all the stocks and bonds of the lighting companies in which it is interested, and with the unimportant exception of The Bronx Gas and Electric Company, controls all the other gas and electric light companies in the Boroughs of Manhattan and The Bronx, that it keeps close watch over their operations and dictates their policy, that its general officers give much of their time and attention to even the details of their business, the 10 per cent. of the three items "General Office Expenses," "Automobiles" and "Advertising and Legal," which in the aggregate amounts to only $45,085.57, will seem a small enough amount to charge against the capital used for other than gas making purposes.

In the matter of taxes, which are shown in total on Exhibit E, and the detail of State taxes further shown on Exhibit M, we have charged the gas business as follows:

Tax Account.

Real Estate	$179,778.95
Special Franchise	406,909.23
Mains, etc., on Private Property	14.91
Proportion of State Tax, figured on the Basis of $39,078,000 Capital Stock Invested in Gas Business and $40,992,000 Capital Stock Otherwise Invested.	129,155.02
Local Tax on Personal Property, 25% of $88,839.00	22,209.75
	$738,067.86

We have not taken account of interest due on unpaid taxes; the testimony shows that only contested taxes are allowed to remain unpaid.

2239 If the company wishes to contest its tax bills, let it do so at the expense of the stockholders, who alone will benefit, if the contest proves successful.

Interest Account Entitled "Fixed Charges" in Exhibit 94.

Items from Exhibit I.

Bills Payable	$20,637.50
Debenture Bonds	69,488.07
Bond and Mortgage	129.54
	$90,255.11
Less Interest on Bank Balances of Working Capital	22,728.26
	$67,526.55
Add Item from Exhibit 94; Consumers' Deposits	51,391.52
Total	$118,918.37

It is not at all certain that the interest on "Bills Payable" is a proper charge to the gas account, but we have assumed it to save controversy over a small matter.

It is quite certain that the remaining items of interest shown on Exhibit I. have no connection with the gas business.

We have shown 6 per cent. as the proper amount of dividend to be earned, because in the absence of any other agreement the statutes of the State specify that to be the rate of interest governing dealings between its citizens.

Whether as dividend or interest, the rate of 6 per cent. is one that is gladly accepted by many thousands of investors whose 2240 investments are based upon enterprises far less stable than is that of the complainant and no enterprise which is limited to such a percentage of annual earnings on its capital may reasonably claim a confiscation of its property; in addition to this, we are fully persuaded that by the exercise of strict economy and the proper distribution of its expenditures the complainant may easily make a better showing than we have here done.

The charging of ten cents per thousand feet of gas sold, to a contingent fund, which appears in the accounts of the complainant last year, for the first time in its history and which thus abnormally increases the apparent cost of gas, is a matter that cannot, in good faith, be defended. Particularly absurd is one of the reasons given for the establishment of such a fund—that at some time in the future it is contemplated to break up one-half its plant and turn over its manufacturing business to another corporation operating in another borough.

If anything more illogical than to ask the consumers of gas in the City of New York to bear an expense of that kind has been introduced at this hearing, it has escaped our notice.

Equally fanciful and romantic are some of the other reasons given for the establishment of that fund.

Slow decay by electrolysis of the underground plant is one of the anticipated disasters; but the use of electricity in New York is no new thing, and the complainant's Superintendent of Mains has testified that he has never exposed nor removed a pipe that was not as sound as when it was laid; and some of them have been in the ground since 1825.

Nor can we agree with the Gas Commission, that any greater sum for renewals should be allowed than the actual cost of the same.

In addition to ordinary repairs, it is in evidence that extra- 2241 ordinary repairs and renewals, replacements and supercessions have been going on ever since the complainant acquired its property in 1884, and the result has been to bring the plant to such a state of perfection as to elicit testimony from the officials of the company that it cannot now be improved upon.

That being the case, it is reasonable to assume that the cost of further renewals must be constantly lessened, and only ordinary repairs, with an occasional renewal of minor parts of the plant, be expected in the future.

Much time has been consumed at this hearing in seeking to prove by expert testimony the considerable value of the real estate and plant of the complainant over and above its cost and book value. It would seem to be time and labor wasted; if proved, it would only show that the original investment of the company was not a bad one, and it is the investment of capital that we have to consider, not the fluctuations in value of the property acquired to serve the public in the business of making and selling gas.

We may only express the hope that the officials of the complainant company will not forget what they have so diligently sought to establish, when next they are called upon by the tax assessor.

We are not especially concerned with the interests of that portion of the capital stock invested in the securities of other companies.

It is true that Exhibit B shows a return from such investments of less than 2 per cent. in 1905, but it is not true that no more than that small rate was earned.

One of the affidavits in support of our answer to complainant's bill stated that the accounts of the complainant company did not reflect its true earnings.

2242 As substantiating the truth of that affidavit, we refer to Gas Commission Printed Papers on Appeal, Exhibit 170, page 2197, in the case of Keys, complainant, which is here in evidence; that exhibit shows the earnings, expenses and dividends of the Consolidated Gas Company for a period of five years, from 1900 to 1904, and that the dividends paid were in excess of the net earnings for the same period, by the sum of $10,290,354.54.

A note attached to the same exhibit states, however: "The surplus earnings of other gas and electric companies, to which the Consolidated Company, as a stockholder, was entitled, in excess of amounts actually received, were merely sufficient to cover the deficits shown in these statements.

"But owing to the capital requirements of those companies, for extensions and improvements, the Consolidated Gas Company has thus far refrained from drawing such earnings.

"Its own accumulated surplus and reserve, to that extent, have therefore been for the time being diminished."

The complainant has a monopoly of the supply of gas in the territory in which it is engaged in business, in which territory the consumption of gas is greater than in any other territory in the United States, if not in the world.

An investment in this business under these circumstances, with economical and careful management, is as safe as an investment in government bonds and realizing a much larger return.

In the case of Stanislaus County *v.* San Joaquin C. & I. Co., reported in 192 U. S. Reports, Judge Peckham, at page 213, says:

"It is not confiscation nor a taking of property without due process of law, nor a denial of the equal protection of the laws, to fix 2243 water rates so as to give an income of six per cent. upon the then value of the property actually used, for the purpose of supplying water as provided by law, even though the company had prior thereto been allowed to fix rates that would secure to it one and one-half per cent. a month income upon the capital actually invested in the undertaking. If not hampered by an unalterable contract, providing that a certain compensation should always be received, we think that a law which reduces the compensation theretofore allowed to six per cent. upon the present value of the property used for the public is not unconstitutional. There is nothing in the nature of confiscation about it."

In the case of the Covington and Lexington Turnpike Road Company *vs.* Sandford, decided at the October Term, 1896, U. S. 164, page 396, it was held:

"It is proper to say that if the answer had not alleged, in substance, that the tolls prescribed by the Act of 1890 were wholly inadequate for keeping the road in proper repair and for earning dividends, we could not say that the Act was unconstitutional *merely because the Company* (as was alleged and as the demurrer admitted) *could not earn more than four per cent. on its capital stock.* It cannot be said that a corporation is entitled, as of right, and without reference to the interests of the public, *to realize a given per cent. upon its capital stock.*

* * * * * * *

"But that involves an inquiry as to what is reasonable and just for the public. * * * That inquiry also involves other 2244 considerations, such, for instance, as the reasonable cost of maintaining the road in good condition for public use, and the amount that may have really and necessarily been invested in the enterprise.

"*In short, each case must depend on its special facts;* and when a Court, without assuming itself to prescribe rates, is required to determine whether the rates prescribed by the Legislature for a corporation controlling a public highway are as an entirety so unjust as to destroy the value of its property for all the purposes for which it was acquired, *its duty is to take into consideration the interests both of the public and the owner of the property,* together with all other circumstances that are fairly to be considered in determining whether the Legislature has, under the guise of regulating rates, exceeded its constitutional authority and practically deprived the owner of property without due process of law."

It is well settled the rate fixed by the Legislature is presumed to be reasonable until proven otherwise.

This presumption the complainant has not overcome. It has entirely failed to prove the rate fixed unreasonable or confiscatory, and the motion to dismiss should therefore be granted.

I move to dismiss on the further ground:

II. The bill of the complainant herein should be dismissed for the further ground that it has failed to prove that its property has been confiscated within the provisions of the Constitution. Taking the figures introduced by the complainant, it does not appear from them that if it continues to operate its business that such business will be conducted at an *actual* loss, but merely at a reduced profit, and it is submitted that unless it can be shown that an actual 2245 loss will be inflicted upon the complainant there is no confiscation.

In the cases which limit the doctrine laid down in the case of Munn *vs.* Illinois, we do not find any clear definition of what constitutes confiscation until we reach the case of Cotting *vs.* Kansas City Stock Yards Co., 183 U. S., p. 79, in which Mr. Justice Brewer, giving the opinion of the Court, says at page 93 as follows:

"* * * The owner has intentionally devoted his property to

the discharge of a public service. * * * He deliberately undertakes to do what is proper work for the State. * * * It may be said that he voluntarily accepts all the conditions of public service which attach to like service performed by the State itself. He expresses his willingness to do the work of the State, aware that the State in the discharge of its public duties is not guided solely by a question of profit. It may rightfully determine that the particular service is of such importance to the public that it may be conducted at a pecuniary loss, having in view a larger general interest. At any rate, it does not perform its services with the single idea of profit. Its thought is the general public welfare. If in such a case an individual is willing to undertake the work of the State, may it not be urged that he in a measure subjects himself to the same rules of action, and that if the body which expresses the judgment of the State believes that the particular services should be rendered without profit, he is not at liberty to complain? While we have said again and again that one volunteering to do such services cannot be compelled to expose his property to confiscation, that he can-
2246 not be compelled to submit its use to such rates as do not pay *the expenses* of the work, and therefore create a constantly increasing debt which ultimately works its appropriation, still is there not force in the suggestion that, as the State may do the work without profit, if he voluntarily undertakes to act for the State, he must submit to a like determination as to the paramount interests of the public?"

This is undoubtedly the test of confiscation of property where public service corporations are concerned; are the rates so low as to prevent the company from meeting its obligations? Unless this can be established there is no *taking* of property.

It is submitted that the Court must distinguish between *unreasonable* rates and *confiscatory* rates, as a rate may well be unreasonable without actually confiscating property within the meaning of Judge Brewer's definition. The province of the Court is only to determine whether or not the rate fixed by the Legislature is unconstitutional, in that it confiscates property, while it is the province of the Legislature in fixing the rate to determine whether or not the rate fixed is reasonable. If the complainant is aggrieved at the amount of dividends it is able to earn under the rate as fixed, it should address itself to the Legislature for the amending of such rate, and not address itself to the Court, unless it is prepared to prove the actual *taking* of property. Where, however, any profit, no matter how small, can be made under the established rate, the company has the alternative of applying to the Legislature for relief or retiring from the business.

I move to dismiss on the further ground:

III. The bill of the complainant herein should be dismissed
2247 for the further ground that said complainant has failed to introduce any evidence showing the true cost of its property, plant, etc., which figure must be taken into consideration in determining whether the rates established by the Legislature are confiscatory.

That such value must be taken into consideration is determined, it is submitted, by the decisions in the various United States Supreme Court cases in which this question has been at issue, on the broad grounds of equity, although the language used in several instances shows the Court disregards *the cost* for the *fair value* of the property.

Careful consideration will show the reason for this, and that the defendants' contention is based on the identical grounds adopted by the Court in those cases, namely, that where the public has an interest in the business it is inequitable to allow a corporation operating the business to earn dividends on unfair investments.

In the case of Stanislaus County *vs.* St. Joaquin C. & I. Co., 192 U. S., p. 214, the Court, in taking the market value as distinguished from the actual cost as the basis, used the following language:

"The original cost may have been too great; mistakes of construction, even though honest, may have been made, which necessarily enhanced the cost; more property may have been acquired than necessary or needful for the purpose intended. Other circumstances might exist which would show the original rates much too large for a fair or reasonable compensation at the present time. Notwithstanding such facts, are the shareholders in the company to be forever enti-led *at* eighteen per cent. upon this cost, and does a reduction in amount, as provided for in the Act of 1885, take away property in violation of the provisions of the Federal Constitution? We think not. * * *"

2248 If the Court then refuses to allow a return on money *actualy* but *improperly spent,* it is submitted that it cannot by any distortion of reason permit a return on money *never* spent. It will be noted that the present case is the first one where the *value* of the property of the complainant *exceeds* the *original* cash investment, and presents a case quite the reverse of the former cases, but in which, on the broad grounds of equity, the Court must take as a basis the actual investment and not the actual investment plus the unearned increment; that is to say, the present value.

There is no evidence introduced by the complainant as to the cost of its property and plant prior to the year 1884, when the consolidation was effected. A moment's consideration will show that the 1884 values cannot be taken as the true cost, but that the actual cost of the six subsidiary companies must be determined. It is submitted that the complainant cannot by the subterfuge of consolidation in 1884 increase the true cost of its property and plant, and that the Court must, under the decisions, disregard all such increase in paper values in the same manner as the courts have heretofore construed money rashly or ill-advisedly spent.

There being no evidence as to the true cost of the plaintiff's plant and property on the record, the basis for the determination of the issue is not established, and the complainant's case fails.

2249 UNITED STATES OF AMERICA,
Southern District of New York, ss:

I, John A. Shields, Clerk of the Circuit Court of the United States of America, for the Southern District of New York, in the Second Circuit, do hereby Certify that the foregoing (Vol. 3), pages, numbered from 1443 to 2248 inclusive, contain a true and complete transcript of the record and proceedings had in said Court, in the cause entitled Consolidated Gas Company, Complainant, Appellee, against Julius M. Mayer, as Attorney General, *et al.*, Defendants-Appellants, as the same remain of record and on file in my office. (Vol. 3.)

In Testimony Whereof, I have caused the seal of the said Court to be hereunto affixed, at the City of New York, in the Southern District of New York, in the Second Circuit, this 15th day of May, in the year of our Lord One Thousand Nine Hundred and eight and of the Independence of the said United States the One Hundred and thirty-second.

[Seal of U. S. Circuit Court, South. Dist. New York.]

JNO. A. SHIELDS, *Clerk.*

[Endorsed:] United States Circuit Court of Appeals for the Second Circuit. —— —— *vs.* —— ——. Transcript of Record from the Circuit Court of the United States for the Southern District of New York.

VOL. III.

SUPREME COURT OF THE UNITED STATES.

2249*a* Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *October* 1, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Garver, Mr. Page, Mr. Kirby, Mr. Burr.

U. S. Circuit Court, Southern District, N. Y. Filed Jun- 24, 1907. John A. Shields, Clerk.

2250 MR. BURR: I wish to say, Mr. Master, that since the last adjournment I have made a motion before Mr. Justice Lacombe for an examination of the books of the company and for an inspection of its plants. That motion was set for last Thursday, and because of my illness it went over until Friday next. I have also, as was suggested at the last hearing, served in formal manner the motions I made then informally to dismiss and to strike out; copies of those papers were served upon the respective attorneys, and they are now handed to us by the stenographer in printed form, and they form part of the record. I find that there was one motion that was omitted.

I therefore now move further to strike out the testimony of Bradley, Simpson, Carter, Addicks and Humphreys so far as such testimony is based on the exhibits or statements purporting to be taken from the books of the company. And I also move to strike out the act or the franchise which was offered relating to the Mutual Gas Light Company.

MR. PAGE: I join in the motion made by the City of New York to strike out the testimony, and I would like to have the following spread on the record as my statement of my motion to dismiss:

The defendants, Julius M. Mayer, as Attorney General, William Travers Jerome, as District Attorney, Frederick E. Gunnison, John C. Davies and Lucian L. Shedden, constituting the New York State Commission of Gas and Electricity, move to dismiss the bill of complaint herein on the complainant's evidence, on the ground:

That the complainant has failed to establish its case in this, that

2251 I. The complainant has failed to show that Chapter 736 of the Laws of the State of New York of 1905 and Chapter

125 of the Laws of the State of New York of 1906, in so far as they establish a rate to be charged for gas to the City of New York at 75 cents per thousand feet, and to the private consumers at 80 cents, is confiscatory in that it does not allow a fair return on the capital invested in the business of making and distributing gas.

II. The complainants have failed to prove what it costs *it* to make and distribute gas to its consumers.

The testimony given is argumentative merely, although it was shown that records were kept by the secretary of the company which showed month by month what it actually did cost, and these records were not produced in evidence.

III. The complainants have failed to prove the amount of capital actually invested in making and distributing gas upon which *it* would be entitled to a return.

All the complainant's evidence as to value is hypothetical, and does not bear any relation to actual conditions or proper hypothesis, (*a*) The value of its real estate is given as the valuation of vacant lots without buildings, while their witness, Mr. Priess, admitted that the same was less valuable with a gas works upon them; (*b*) no evidence has been given showing exactly what portions of the real estate were used by the company in its gas-making business; (*c*) the valuation of buildings and plant is given at the cost to-day to reproduce the identical buildings and machinery, irrespective of the fact as to whether they were commercially and economically worth re-
2252 producing; (*d*) the complainant has failed to prove the amount of capital actually invested in its real estate and plant, or what it would cost to construct a plant that would produce and distribute the same amount of gas under modern conditions.

IV. The complainant does not prove or claim that it cannot earn and does not earn sufficient to pay four per cent. in dividends on its entire capital stock, although more than one-half of which is conceded to be invested in the stocks, bonds or obligations of other companies.

It has been shown that the complainant to-day, under the operation of these laws, is paying four per cent. dividends on $80,000,000 of capital stock. It has been proved that at least $56,000,000 of this capital is invested in the stocks and securities of other companies which are very largely unproductive.

V. The complainant has failed to prove that it is impossible to comply with the regulation with regard to pressure contained in said Acts of the Legislature.

It is admitted that no attempt has been made to regulate and control the pressure, and that in other cities district governors are used for that purpose. That it might cost the complainant something to comply with the law does not render it unconstitutional; it must be shown that the penalty attaches for the failure to comply with an impossible condition.

VI. Chapter 737 of the Laws of 1905, which establishes a commission of gas and electricity, is clearly a constitutional exercise of the power of the Legislature, and the order made by it February 23d, 1906, was a reasonable exercise of its powers, for the reasons set forth under the foregoing subdivisions of this motion.

The MASTER: I will make no disposition of those motions 2253 at present until I have had an opportunity to examine them. The understanding was at the last hearing that they were to be submitted within a week thereafter and sent to me some time before this hearing to be passed on. I observe the time schedule has somewhat overrun and so I will defer action on them for the present.

Mr. BURR: They probably would have been served sooner only I went straight from this hearing to a sick bed and was several days in bed.

The MASTER: I am sorry to hear that. Are we ready to proceed this morning?

Mr. KIRBY: I have some motions to make here in the absence of Senator Page, who is talking over the telephone. I will simply read from his memorandum:

The defendant moves that the hearing herein be adjourned until after the presentation and determination of a motion brought on by an order to show cause which was returnable last Friday before the judge sitting in the Circuit Court of the United States for the Southern District of New York, and which order was as follows:

Upon the annexed affidavit of Gustavus T. Kirby, verified the 25th day of September, 1906, on all the pleadings and proceedings had herein.

It is Ordered that the complain-t show cause before the Hon. E. Henry Lacombe at a stated term of this Court, to be held in the General Post Office Building in the Borough of Manhattan, City of New York, on the 27th day of September 1906, at 11:30 o'clock in the forenoon, or as soon thereafter as counsel can be heard, why an order should not be issued directing the complain-t herein to 2254 permit an examination of its books, papers, vouchers and plants, buildings and apparatus by the accountants and engineer of the defendant, the State of New York, and for such other and further relief as to the Court may seem just and proper.

And it is further ordered that service of a copy of this order and of the affidavits upon which the same is based, upon the attorneys for the parties hereto on or before the 25th day of September, 1906, shall be sufficient.

Dated, New York, September 25, 1906.

(Signed) C. M. HOUGH, *P. J.*

Mr. KIRBY: And the affidavit thereto annexed to be spread on the record as though read.

Mr. MATHEWSON: Is it necessary to spread that on the record? I think that the statement is that a motion has been made of a certain general character, and it does not seem necessary to spread the affidavit on the record from which that is made.

The MASTER: What is the necessity of that?

Mr. KIRBY: I see no reason why the affidavit itself should be spread on the record, but the relief asked for being stated in the order to show cause, I think should have been spread on the record and that is the part I have read.

Mr. Mathewson: No objection to that.

Mr. Kirby: Then we do not offer the affidavit at this time. And we also ask that the hearings herein be adjourned until after the hearing and determination of the motion for a similar order brought on by the defendants, the City of New York, and which motion is practically in the same form as that or the order to show cause which has been read. The grounds of this application are generally those set down in the above moving papers as the reason why the
2255 hearing before the Master should be adjourned until after
the defendants have an opportunity to examine the plants, books, and records of the complain-t; specifically upon the grounds that until after the hearing and determination of these motions the defendant will be in no position to determine the kind and character of its defence and the nature of its testimony which it will present. If the motions made should be granted, its defence will consist of testimony of its experts relative to results of such examination, and their deductions therefrom. If, on the other hand, the motions are denied, its witnesses can only give testimony as to their opinion of the correctness or incorrectness of the testimony of the witnesses of the complain-t, and make on their own account such deductions therefrom as seem to them fit and proper. Such testimony being largely hypothetical would be but cumbering the record, and unnecessarily, if the defendant was permitted to, from its own examination, obtain the information demanded in the motions referred to and which is imperative and necessary to its defence.

The defendant takes occasion to here state to the Master that the arguments of the motions referred to has been adjourned by the Court until Friday, October 5, 1906; that such adjournment was not at the request of the State of New York, but that on the other hand the State was ready to proceed with the argument thereof on the return day of the argument to show cause—that is, on the 27th day of September, 1906.

That the complainant on the return of said order to show cause on said 27th day of September, 1906, stated that it was not ready to proceed for the reason that the order to show cause had not
2256 been served upon it until the 25th day of September, 1906;
and that while such statement was true, that as the complainant was aware (and which the papers themselves show) the motion of the State was identical with that of the City of New York, which made service of its moving papers on Saturday, the 22d day of September, 1906; the same being within the time permitted by the Court for regular notice of motion to be served; and further, that the complainant had been informed before the adjournment of this hearing on Friday, September 7, 1906, that such an application was to be made and as to the grounds upon which the application would be made.

And the defendant stands ready to argue such motion at this or any other time, and is in no way responsible for the adjournment of said argument until the date set by the Court for the hearing thereof.

The defendant has made repeated application for the permission requested in its moving papers, both to the Master and to the complainant, and that such application has in each instance been denied.

Mr. **Burr**: I would say in addition to what I have already said on that subject that I got out of my sick bed to prepare these papers for the motion for the examination of the books and the inspection of the plants which I deemed was very essential for the preparation of the defence of the City, and those papers were served on the 22d day of September—at least a notice of motion—and the motion was returnable on the 27th day of September, 1906. On that day I was unable by reason of illness to appear and argue the motion and it was adjourned by Mr. Justice Lacombe until Friday.
2257 The City finds itself in the same difficulty as the State. Our experts whose affidavits are attached to the voluminous papers that I propose to submit on this motion all agree that without such an examination of the plants and without such an examination of the books as they ask for in these affidavits, the City will be seriously hampered in the proper presentation of its defence. If I proceed this morning with our case it will be with the serious disadvantage that we are obliged to take the statements as they are on record here, without the examination of the books which is the source from which these statements have been taken, and without an examination of the plant, the valuation of which has been testified to by those who carefully examined them on behalf of the complainant. That is all I desire to say at this moment.

Mr. **Garver**: It seems to me these motions are addressed to a tribunal that has no power to pass upon them. So far as the complainant is concerned we have always gone to Judge Lacombe for an extension and as I understand it, he has expressly stated that he did not propose to allow the time to be extended in this case either by a consent of counsel or in any other way except under his own personal supervision. Now, when these motions came up before him last Thursday and an application was made on behalf of Mr. Burr, for the adjournment, he asked of me whether I had any objection to the adjournment and I said not if the time was not extended and he very emphatically stated at that time that there was no motion before him for an extension, and after some argument by counsel there and reasons stated why an extension should be granted, he de-
2258 clined very emphatically to grant any extension and *and* stated that he had understood that the attitude of the company right along for a couple of months had been that of denying the right to the defendants of the inspection applied for, and in view of the delay of which they had been guilty in making the application he would not consider the motion at that time for further time in which to put in their proof. And the same reasons that have been stated here this morning were stated at that time as to the willingness and readiness of the State to argue the motions. When that was suggested it was replied—although I think Senator Page may have said he was technically ready—yet he certainly suggested that the motions ought to be argued together, and the motions were really put over at the suggestion of Mr. Burr's representative. Further than that, there was a motion made about a month ago, an order to show cause obtained from Judge Lacombe and that came up. That was on the calendar last Thursday and that was a similar motion for additional

time at that time and for an inspection, and that motion was withdrawn and Judge Lacombe, it seems to me, very well suggested the other day, that there was no reason why an adjournment should be given at this time, as he said there were two or three volumes of evidence there that had been taken on behalf of the State in the Gas Investigation and he did not see why some of the time at the disposal of the defendants could not be profitably employed in putting in evidence that was contained in those volumes. Now, all that evidence was given at that time without this inspection of the plants by experts and without the inspection of the books, and if the whole case could have been made up in that way it seems rather 2259 difficult to understand why at least a part of the case could not be made up from such a record. There has not been any statement made here even that anyone except experts on accounts or plants are to be examined; if there are any other witnesses who are to be examined certainly they could be called now as well as later, and in any event it seems to us that the defendants should proceed with their proofs. If their motion should be granted, as to which there may be a good deal of doubt, as that motion has not been argued yet, and if they show good cause later, why, undoubtedly, if they require additional time the Judge will extend it to them.

Mr. **Page**: If the Master please, the statement by Mr. Garver is in many respects correct and in some not correct. Mr. Garver himself made the application for the adjournment, and the ground upon which the motion for the State was adjourned, and that was that the motion papers had only been served upon him or his firm on the 25th. That was the ground that Judge Lacombe stated when he announced that the motion would be adjourned. He said, of course, if the motion papers had only been served on the 25th they should have proper time to reply.

Mr. **Garver**: Wasn't that only after Mr. Burr had made the application for the adjournment and during the course of the discussion as to the adjournment?

Mr. **Page**: That was after he got through with Mr. Burr's motion and took up my motion.

Mr. **Garver**: And after you had stated you did not think the two motions ought to be argued separately.

2260 Mr. **Page**: I stated the two motions should be argued together, and it was stated we should go ahead and argue ours and then you made the application for an adjournment. I think that is the exact way it occurred.

Mr. **Garver**: I didn't make any formal application.

Mr. **Page**: I told the Judge this was not an application to him to extend the time. As our time had not expired I didn't think it proper we should apply for an extension at that time. The Judge then stated that an application for an adjournment should be made to the Master and I stated the Master was out-of-town and if an adjournment was to be granted that I understood from his office that he would probably like to stay out-of-town. The Judge then replied that the Master would be here to-day.

The **Master**: Well, without expressing any opinion at all on the question of this motion to inspect the plant or books, with which I have nothing to do in its present aspect, it does not seem to me that a case is not made out here for an adjournment of these proceedings before me. If the defendants required for the proper presentation of their case this extension they must necessarily have known it long before the complainant's case was closed. It was not necessary to wait until the complainants rested and then until the very end of this recess before bringing the motion on for a hearing.

Mr. Burr: Pardon me a second. When you refer to the inspection of the plant do you also refer to the application for an examination of the books?

The Master: Both of them. These matters now pending. This motion could have been made, so far as I can see, at any 2261 time during the Summer. There were motion calendars called here every two or three weeks and it seems to me that it is rather late in the day now for the defendants, after the complainants had rested and an adjournment was taken by an agreement of counsel for a long recess of two weeks, to come in here without any warning and ask the Master for an adjournment on account of the pendency of these motions. The fact that they might perfectly well have been made at least a month ago is evident by what has been said here this morning that a motion of a similar character was at one time noticed. I remember a discussion before me about an application to be made to Judge Lacombe at one time when he was passing through town here in the Summer, for this inspection. It seems to me the defendants are at fault for not having pressed such a motion as that if they took it seriously, and I don't see that the pendency of these motions now affords any grounds for an adjournment at this hearing to-day.

Mr. Page: The Master may remember that Mr. Mathewson with his usual suavity, has stated every time we have asked him whether they would consent to an inspection of the plant, that he would take that matter up with Mr. Sterling; he didn't really apprehend any difficulty but he would talk it over with Mr. Sterling. The motion that was made and which has been withdrawn—we had to withdraw it that day before the complainants for some reason had noticed it after I had notified both Mr. Garver's office and Mr. Mathewson that we should withdraw that motion almost immediately after it was made.

Mr. Garver: We didn't put that on the calendar, Senator.

2262 Mr. Page: Who did?

Mr. Garver: I don't know how it got on. At least I have been unable to ascertain that it got on from our office.

Mr. Page: It did not from ours.

Mr. Mathewson: I didn't put it on surely.

Mr. Page: Well, that motion was not a motion for a modification of the injunction but to allow an inspection to be made by the Commission of Gas and Electricity and was not a motion for the inspection of the plants by experts. Now, until the complainants had presented their case and put on their expert witnesses we had no means of knowing what position they would take, whether they were going to, as they did, proceed by a process of a valuation of what it would cost to reproduce that plant new to-day, whether they were going to present evidence as to what the plant had cost them and what the actual amount of capital they had invested in the plant was, whether they were going to give evidence to show what it would cost to produce a plant to-day that would not be a duplicate of this plant but would be a plant sufficient to economically produce the amount of gas they would produce and sell; so until they develop their case we are not in a position to say as to what examination would be necessary and what kind of an examination. If they had not given the evidence in the manner in which they did the inspection of their present plants would have not been necessary. If they had gone on on either of the other theories of their case, and neither of which I think would have been a more correct theory than that on which they did proceed——

Mr. MATHEWSON: I think the Senator's quotation of my statement is a little inaccurate. What I did say, as I recollect it,
2263 when the request was made, was that I would take the subject up later with Mr. Garver or Mr. Sterling, and that it might be permitted—we might not object. I did say that, but that took place before Senator Page made his first motion, about a month ago, for the right to inspect the books and look at the plant.

Mr. PAGE: It may be that the statement made at that time was of as much value as those made since, but there was one made not later than the day of adjournment.

Mr. MATHEWSON: But nothing more was said on that subject and nothing more definite than was said before you made that original motion.

Mr. PAGE: No, nothing more definite, except the same condition of uncertainty which prevailed.

The MASTER: And there is another suggestion which has been referred to here this morning which seems to me to be very persuasive in this matter. From the papers on this motion for an injunction in this case which have been placed before me it appears here that the proceeding- before the Gas Commission are said to have been of a most thorough and exhaustive character, and it is to be presumed that this legislation which is attacked here in this suit was not lightly or inadvisedly made but some one must have gone sufficiently into the facts regarding this to justify the conclusions which were finally arrived at and embodied in the legislation.

Mr. BURR: But that statement was attacked by the witness for the complain-t company. They claim and testified that it was a partial, hurried and harried examination which did not do justice to them, and they so swore.

2264 The MASTER: The present application is made on behalf of the defendants in this case, and in the affidavits in opposition to the complainant's motion for an injunction the position of the defendants was—it is immaterial now for this purpose what the position of the complainants may be, but the position of the defendants was that the examination and investigation before the Commission was of the most thorough and exhaustive character. Now it seems to me that under those circumstances the defendants are, to say the least, estopped from complaining now that they cannot go on with something in the nature of evidence to support their side of the case, without any adjournment at this time, pending the decision of these motions. There ought to be enough with these vast volumes of investigations here and records, there ought to be enough for them to put in something to take up the time between now and Friday. I came back to town—that is of course a matter of no great importance, but I came back to town, having taken the trouble to communicate with my office and was advised that both the defendants would be ready to proceed this morning, and I do not see any reason why they should not proceed, at least to some extent.

Mr. Page: As far as the statements made in regard to the investigation of 1884 before the Senate Committee, the Gas Company presented in evidence as usual large claims for the value of the plant, and we proceeded upon what we found in the books and the reports of the Senate Committee that preceded us, and that is that the plants had cost about $20,000,000, and they added about $9,000,000 more to it. We had also their sworn tabulations that had been put in before the Tax Commissioners and they offered no other evi-
2265 dence and therefore we took the evidence that was before us and found or decided that they had a plant worth about thirty million dollars. Before the Gas Commission, the complainants here did not produce any evidence as to the valuation of their plant, put no witnesses on the stand; so far as this particular branch of the case is concerned, it has never been brought forth or forward on the part of the complainant at any of the other hearings that have been had and it is new matter. Now, as far as the voluminous record taken before the Gas Commission is concerned, a very large part of that has already been put in evidence, and probably all has been put in evidence that is material to this proceeding, or substantially so, this being a suit and that being an investigation; the investigation not being limited by issues probably more was put in than could be here put in probably, not being limited there by the ordinary rules as to relevancy to the issue, and the rules as to competency and materiality.

Mr. Mathewson: May I say before the Master makes a statement that the Senator is, I think, in error in one respect. This investigation by the Senate Committee, of which he was a member and to which he has referred, covered only three weeks; it is so pressed that the Committee were absolutely unable to take any evidence in reference to a good many of the outlying companies in the City of New York, although they wanted to do so, and that we were finally offered an opportunity—by "we" I mean the Consolidated Gas Company,—to present evidence the very last afternoon of the session of the Committee, I think about half past 5 o'clock, and I think
2266 we took about an hour to put on one witness, and that this one witness swore that the value of the plant of the company was at least the valuation shown on the books of the company, and yet he having testified to that and being an engineer familiar with the plant, they took the statement in the tax report, eight million dollars, or only a trifle over half the book value, in arriving at their

conclusion, so that the Senator is mistaken in saying there was no evidence before his Committee as to any valuation.

Mr. PAGE: I meant no valuation put in as you put it in here.

Mr. MATHEWSON: Oh, no, not in detail. We didn't have time.

The MASTER: There is another subject that occurs to me. Now, for instance, assuming the defendants intend to take issue on the valuation of this land as to which Mr. Wheelock was examined at some length, or as to the value of the dock property on which there was a witness called—Mr. Green; or assuming that they proposed to take issue on the views of some of these experts here with regard to the question of regulating pressure—there are several matters of that kind in the case which it seems to me in nowise depend upon the investigation or examination of the plants, and I don't see why counsel cannot proceed with those branches of the case——

Mr. GARVER: And a reasonable return on the value of the property to-day.

The MASTER: If you are not going to concede the correctness of the witness Wheelock's valuation you must intend to meet that and there is no reason apparent to me why that should not have been done, why that could not have been arranged, why you could 2267 not have your real State experts on the stand, because that does not in any way depend on an examination of the books. So on the whole I feel constrained to deny these applications for I do not think you have made out a case, much as I regret to have to deny them.

Mr. BURR: I am prepared to go on now on behalf of the City.

The MASTER: Have you a witness here?

Mr. BURR: Yes.

Mr. PAGE: I will let Mr. Burr proceed with his case because I do not feel that for the safety of the State or that with propriety I could proceed until after these motions are heard and determined.

Mr. BURR: I say I am ready to proceed, but of course, under the disadvantage I have referred to, in not having had the inspection and examination, but I will make the best I can of the present situation.

The MASTER: Take up some of the branches I have indicated that will not depend on your examination of the plant or books.

Mr. GARVER: I would like to suggest what I intimated here a moment ago, if they intend to meet the evidence which we gave of the banking experts as to the return on the investment of this kind, that is something that certainly could be done without an inspection of the plant and books.

WILLIAM D. MARKS, called as a witness in behalf of the defendants, being duly sworn, testified as follows:

Direct examination by Mr. BURR:

Q. You might tell us something about yourself, what your profession is?

2268 A I am a consulting engineer and statistician, making a specialty of gas and electricity. I have had a good deal of experience, more particularly in the direction of statistics of costs.

I have attended all of the meetings in these hearings, also before the State Gas and Electricity Commission, and listened to the testimony. I have spent a good deal of time in a careful study of the reports of the Legislative Committees of the State of New York for 1885 and 1886, and the report of the Stevens Commission of 1905.

Q. And the testimony of the Stevens investigation?

A. The testimony also, and have been present at nearly all of the meetings here.

Q. And have you read all the testimony here?

A. I have read all the testimony here carefully. I was graduated——

Q. Wait a moment. Have you read the testimony which was given before the Gas Commission?

A. I have read the whole of the testimony and have analyzed it carefully in the case of the Gas Commission.

Q. As I understand it, you have carefully read the testimony given before the committee appointed in 1885 and the committee appointed in 1886 and the committee appointed in 1905 and the Gas Commission, as well as the testimony presented and adduced here before the Master?

A. I have.

Q. Proceed, please.

A. I was engaged by the Corporation Counsel in January, 1906, and I have practically given my undivided attention to the analysis and study in connection with the cost of gas in connection with this case, and also looked up authorities in many other cases of more recent date. I was graduated by the Scientific Department of Yale College in 1870, taking the degree of Bachelor of Science, and in 1871, after a year of post graduate study, was given the degree of Mechanical Engineer. During a portion of the year following I pursued my engineering studies in Europe. In 1871 I entered the employ of the D., L. & W. Railway as an assistant of the division engineer, after which becoming transit man on the Chicago & Northwestern Railway. In 1872 I was appointed resident engineer and accountant for the contractors building the Laclede Gas Works in St. Louis Missouri. I was the subordinate of William Farmer, a gas engineer of New York City, who furnished all the drawings and specifications for these works, and it was my business to care for the execution of the work from them. I remained with the Laclede Gas Company until their works were completed and put in operation, and then took up the building of railway locomotives and machinery and of blast furnaces and machinery as a contractor until 1876, when I was appointed instructor in mechanical engineering at Lehigh University upon the recommendation of the Faculty of Science at Yale. From 1876 until 1887 I held the chair of the Whitney professorship of dynamical engineering at the University of Pennsylvania, giving instruction in engineering and in mathematical study of force and motion, including electricity. In the year 1884 I interrupted my service as professor on leave of absence to become superintendent and organizer of the scientific work of the

2269

International Electrical Exhibition at Franklin Institute at Philadelphia. This was the first of all the electrical exhibitions.

In 1885 I was Chairman of the Executive Committee of the Franklin Institute, which instituted and completed its well-known standard series of experiments on steam and steam engines, boilers, electric dynamos, incandescent and arc-light illumination. Though having general charge and arrangement of all this work, I was specially in charge of the details of electrical measurement and of photometric tests. In 1887 I relinquished my position in the University
2270 of Pennsylvania to become engineer to the Philadelphia Edison Electric Company, and designed and built for that company a ten thousand horse-power electric light station, it being at that time the largest individual station in the world, and the first one built of that size. In 1892, having completed the engineering construction and put it in operation, I was made President of the Philadelphia Edison Electric Company, and reorganized its business, earning and paying an actual dividend to the stockholders of 53 per cent. in four years. In 1896 the Edison Company of Philadelphia sold its property at a profit of one million dollars, thus paying its stockholders 103 per cent., dividends included, on its investment of two million dollars.

In 1899 the Edison General Company of New York City appointed me engineer-in-chief, and the *the* then president, Mr. Henry Villard, assured me of their intention to shortly make me president, but after a few months I preferred returning to Philadelphia. Since 1896 I have given my attention to construction of electrical apparatus and practiced as an engineer, being connected as manager, director or president with some fifteen or sixteen electric light and electric railroad companis, undertaking for them, as was required, either the actual construction of new work, the operation of going work and the organization or reorganization of their finances and accounting department. At all times during my technical work as an engineer, I have given a great deal of attention to the finances and accounting departments of all the corporations with which I have been connected as an engineer or manager or president. At all times during my technical work as an engineer I have invariably kept accurate account of costs, not only of construction, but also of operation. I have been in charge of affairs of large corporations and am entirely
2271 familiar with their methods of keeping their books and accounts, and have made special studies of a very large number of them. Of late years I have been engineer and built and operated gas works in Durham, North Carolina, and reorganized and operated gas works in Fostoria, Ohio. From 1876 I was regularly employed as expert engineer and accountant for gas works all over the United States, in which Mr. Arthur W. Benson, president of the Brooklyn Gas Light Company, and his associates were all very largely interested, and I have made many expert reports to them on their interests and on their gas works.

Besides many scientific papers and books on engineering, I have written a book on Finances of Gas, Electric Light and Power Enterprises, which has reached a third edition, selling over 5,000 copies within the last two years. I am an honorary member of the Franklin Institute of Philadelphia for scientific services rendered, and was for some time chairman of its committee on science and the arts; I am a member of the American Philosophical Society; a Fellow of the American Association for the Advancement of Science; a member of the American Institute of Electrical Engineers—I was a charter member of that organization; I am a member of the American Gas Light Association and also of other technical associations, and I have also been offered many elections to technical societies, which I have declined for lack of leisure.

Q. Now, have you for some years past given special attention to investigations relating to the capitalization and operating expenses of quasi-public corporations?

A. I have made a study of them for two or three years past to the exclusion of almost all else.

2272 Q. And that has enabled you to become familiar with the kind of investigation that is absolutely necessary before you could make an independent or absolutely trustworthy report?

A. It has.

Q. And what does such an investigation consist of, in your judgment, as an absolute prerequisite before you can make an independent and trustworthy report?

A. Assuming that both parties to an investigation of the value and also of the profitableness of a gas works are acting in entirely good faith, it is usually customary, and I have never known it to be refused, that a——

Mr. MATHEWSON: I object to that and move to strike it out. It is not an answer.

The MASTER: He may go on.

Mr. MATHEWSON: I except.

The WITNESS: That careful examination of the work shall be made by a duly qualified expert or experts, both with a view of learning its present condition and its future possibilities. This is generally followed by a careful inventory, giving the actual structural cost of the wohks and properties, also a present valuation of them. In addition to this, I have never know-, where both parties were open in their dealings, such a thing as a refusal of an examination of all vouchers and of all check stubs or checks themselves, if returned, covering the question of the actual structural cost of the work. Referring now to the question of operation of works, the inspection of the works is usually made with a very careful regard to their condition, the question being whether or no these works are fairly up-to-date and in fairly good repair being an important question and this in turn is followed by a very careful investigation of the actual cash costs of the production of gas or whatever other manufactured product may be for sale. Perhaps, however, the most important point in connection with such an investigation as 2273 this lies in the future possibilities of the quasi-public corporation; that is, as to the amount which can be hoped for in the future in the way of sales and, consequently, of profit.

Q. When you speak of vouchers and checks, did you mean also books showing the cost of these structures and plants and apparatus and the cost of operations?

A. It is impossible to classify vouchers and checks without corollorating them exactly with the books and with the entries in the books, item by item and detail by detail.

Q. You have not had any such investigation or examination of the books of the Consolidated Gas Company?

A. I have, on personal application, been refused by Mr. Addicks an opportunity even to make a cursory examination of the works.

Mr. Mathewson: I move to strike that out as not responsive and improper. The question was whether he had had an opportunity to examine the works.

The Master: It is not necessary for you to undertake to sum this case up on the stand. If you will, just answer the question. You were asked if you had made such an examination. You either have or you have not.

Q. You have not made an examination of the books of the Consolidated Gas Company, nor have you made an examination of the plants of the Consolidated Gas Company?

A. I have not.

Mr. Mathewson: I want to say we would immediately take issue with the statement——

The Master: There is no need of taking up the record with this bickering. If the thing is to be taken before the Court, the Court will decide.

2274 Q. Did you ask for an inspection or examination of the plant?

A. I did.

Mr. Mathewson: Objected to as immaterial and irrelevant. He is not the defendant, nor would such a request properly come from him, and we would not consider it, perhaps, if it did.

Q. Did you ask, representing the Corporation Counsel of the City of New York, any officer of the Consolidated Gas Company for leave to inspect its plants?

Mr. Mathewson: Objected to on the same grounds.

The Master: I do not see how this is at all material to the defendants' case.

Mr. Burr: We are going to continue, of course, and we want to show, as far as this witness is concerned, having a knowledge of what is absolutely necessary before a correct report can be made, that he sought to make this investigation and inspection.

The Master: You have shown that he did not make it and why he did not make it, and it appears in long detail this morning about these motions you are making before the Court.

Mr. Burr: I want to show as a careful expert he used every means he could to make such an examination.

The Master: You are entitled to have your record full enough to protect your rights with regard to this point. The mere fact of the pendency of these motions is sufficient for that. When you go beyond that, it is wasting time.

Mr. **Burr**: I want to get on the record the fact that he made a request for the inspection and it has been refused.

2275 Mr. **Mathewson**: We understand no such request has been made——

The **Master**: That is the point. You opened up all these matters——

Mr. **Burr**: I do not want to appear captious about this, but in view of what Mr. Mathewson has said I will ask him this question: Have you not refused an opportunity to the City of New York to make such an investigation?

Mr. **Mathewson**: I object to that question.

Mr. **Burr**: I am asking you. Have you not here refused the City of New York——

Mr. **Mathewson**: I am not on the witness stand. You have asked the witness whether he has not made a request of somebody. I say we do not understand that any such request was made by him. As to whether you have made such a request, that is another proposition, which I do not intend to answer.

The **Master**: There is another thing! I have repeatedly said that experts should have an opportunity to examine the books, and so far as any request that has been made of me, the books have been brought down, with the exception of some large payrolls. If any complaint had been made to me that experts were not having sufficient opportunity to examine those books up there while cross-examination was in progress, I should have taken such steps as I was able to, to see that they had such opportunities. It was fair that they should, and that has been my position from the outset.

Mr. **Burr**: We will have to stand on the record as it is made, I suppose.

The **Master**: I will sustain the objection to this line of examination.

2276 Mr. **Burr**: Under the rule I presume he may answer?

The **Master**: Yes.

(Question read by stenographer.)

A. I did.

Q. And was that request denied?

Same objection.
Same ruling and exception.

A. It was.

Q. Who was it?

Same objection.
Same ruling and exception.

A. Mr. Addicks and Mr. Carter.

Q. Mr. Addicks is the Vice-President?

Same objection.
Same ruling and exception.

A. And Mr. Carter is the Secretary.

Q. And, now, have you made a careful study of the exhibits that have been produced in evidence here by the Consolidated Gas Company?

A. I have.

Q. And have you from such study arrived at any conclusion as to what effect the passage and enforcement of the laws regulating the price of gas to seventy-five cents to the city and eighty cents to the general consumer will have upon the operation of the Consolidated Gas Company?

A. I have made a careful and laborious investigation on that point.

Q. And will you give us the result of such investigation?

Mr. Mathewson: I think that question is too broad, Mr. 2277 Master, and I object to it on that ground as calling for conclusions which really it is the preregative of the Master and the Court to draw.

The Master: Is not that a little wholesale, Mr. Burr?

Mr. Burr: I will go into it in a little more detail if Mr. Mathewson prefers me to, but I thought we would save time, and the period is limited, but if he wants me to ask question by question I will ask them.

Mr. Mathewson: I do not want you to put the witness on and ask him what he thinks is the effect of producing a revenue lower than the company is entitled to. You practically put that question.

The Master: I will allow you, Mr. Burr, to bring out a very general question, and I don't expect you to cross-examine your own witness as to the details of his conclusions; but it seems to me, if you are going to ask what he figures out, for instance, the cost of gas ought to be on the data he has tabulated, or testimony of that sort, as it now is, you simply ask him what is the effect of this legislation. That is a little too broad.

Mr. Burr: Upon the output of gas of the Consolidated Gas Company. I was proceeding to ask him in a little more detail.

The Master: You can ask him what the cost is which he figures out, or any such question of that kind. Ask him a question which gets at the crux of the whole thing.

Q. And you made a careful investigation of the production of gas by the Consolidated Gas Commpany since 1884?

A. I have.

2278 Q. And of the sales of gas since the same year?

A. I have, year by year.

Q. And have you put that in the form of a record of graphic record?

A. I have.

Q. Is that the paper which I now hand you?

A. Yes.

Mr. Mathewson: Will you let us have one of these??

Mr. Burr: Yes, with pleasure.

Q. Is that the paper which I now hand you?

A. It is.

Q. And as the result of such investigation do you find that the enforcement of the law, making the price to the City of New York at 75 cents and the price to the general consumer at 80 cents, will increase or diminish the sales of the Consolidated Gas Company?

Mr. Mathewson: Just a moment. If the witness were asked whether in his opinion the sales would increase or decrease, I do not think I would object to the question, but it seems to me in the form it is put, I shall have to object to it.

Mr. Burr: So as to make it unobjectionable, I will ask him this question:

Q. Will the sales of gas, in your opinion, increase or decrease?

A. They will greatly increase.

Q. Will you tell us the method by which you arrived at that conclusion?

A. Mr. Mathewson, there are a great many figures in this. It is not a long matter, of which I have made a note, and I can abbreviate what I have to say very much by reading from my notes and turning the figures over to the stenographer as I do so.

2279 The Master: There is no objection to that, I suppose.

The Witnesss If the price of gas is reduced to 75 cents to the city and to 80 cents to the private consumer during the year 1907, the gross receipts from the sales of gas will probably amount to 15,342,981,000 cubic feet at 80 cents, or to $12,274,385.18, as against the following for the year 1905, for the Consolidated Gas Company:

By Mr. Mathewson:

Q. What year is this, 15,342,981,000?

A. 1907.

Q. Your testimony is that in your judgment it will increase to that amount, not by that amount?

A. Yes, to that amount.

By the Master:

Q. If you will allow me to interrupt, Doctor, where does that result appear on this chart?

A. On the chart in the year 1907, the Island of Manhattan shown at the top, the total sales of the four companies, the Consolidated Gas Company, the Standard Company, the New York Mutual Company and the New Amsterdam Gas Company will amount to 22,569,845,605 cubic feet, of which the Consolidated Gas Company, speaking accurately, would probably sell 15,342,981,000 cubic feet, or about 68 per cent.

By Mr. Burr:

Q. What do you estimate the population of the Borough of Manhattan will be in 1907?

A. The estimated population of the Borough of Manhattan in the year 1907 will be 2,217,295. You will find it at the top of the blue print.

Mr. Mathewson: What date in 1907.

The WITNESS: December 31st.

2280 Q. And what will be the per capita consumption of gas at 80 cents?

A. 10,179 cubic feet, about.

Q. From your study into the previous history of the gas companies now operating in the Borough of Manhattan, what has been the effect in a reduction in the price of gas?

Mr. MATHEWSON: The witness takes the output of gas for each year and he is asked to state from that what the effect of the reduction of gas is. Assuming by that question that the increase in the sales of gas has been all due to reduction of price, whether it is or not is a question of argument. The gas war and the use of gas for fuel due to the strike, all those things being considered, it seems to me the question is not a proper one, the way it *us* put.

Mr. BURR: If there is such a thing that reduction of price means greater consumption, that can be shown by this witness.

The MASTER: He can testify to it as his opinion on that subject from his familiarity with the general questions in regard to gas distribution and consumption and from his study of these data which are in evidence.

The WITNESS: Under average conditions the reduction in the price of illuminating gas or heating gas always results in a larger output per capita and, consequently, a larger total output for the station.

Q. Now, will you give us more in detail, Dr. Marks, what is shown in your opinion by this table which you have prepared here and which you have now before you?

A. State's Exhibit H for the year 1905, Sales to private consumers, 12,884,637,789 cubic feet, to $12,872,269.88.

2281 From Complainants Exhibit 103:

Metered Service to public buildings		127,712,700 c. f.
Arbor Lamps		32,600 c. f.
Gas for public or streets lamps (Estimated)		270,779,679 c. f.
Total		398,524,978 c. f. at
90c. per M. c. f. or	$358,672.48	
Added to	12,872,269.88	
Gives a total revenue from gas of	$13,230,942.36	
If from this we subtract	12,270,385.18	
We have a diminution of gross revenue from gas of		$956,557.18

instead of the alleged diminution of 20 per cent. of $13,230,942.36, stated to be or appearing to be $2,646,188.47. The figures leading to this result——

By Mr. MATHEWSON:

Q. That is for 1907 that you are assuming?

A. Yes, for 1907.

By Mr. **Burr**:

Q. How do you arrive at that result, Doctor?

A. As this involved immense amounts of both gas and of money, in order to be as nearly absolutely impartial as possible, it was necessary for me to trace the history of the output of gas and the prices of gas beginning at a point when electricity first put in an appearance in 1888 as a serious competitor. That was the time
2282 at which it really began to make some inroads on gas. And that is shown by means of a line shown on this blue print, giving the actual output per capita each year, beginning in 1888 and giving the price at which the gas was sold, and also showing at the right hand side of that blue print all the gas that was burned on the island of Manhattan. You see the island of Manhattan in the year 1905 burned something like 19,540,000,000 cubic feet of gas, while the whole State of Massachusetts burned a little over ten million cubic feet, only about one-half, and this elaborate work was due to the enormous responsibility connected with an opinion on the problem. The figures leading to this result are obtained as follows:

For the calendar year 1905 the total sales of gas of the Consolidated Gas Company amounted to 13,283,164,000 cubic feet and the total sales of all companies on the island of Manhattan amounted to 19,540,243,000 cubic feet, showing the Consolidated Gas Company to have sold 67.98 per cent. of all the gas on the island of Manhattan, and making its total sales, 15,342,981,098 cubic feet, with the same ratio in 1907.

To learn how the probable gross revenue from the sales of gas of $12,274,385.18 is obtained, we are obliged to refer to a graphic record of the sales of gas herewith presented.

Mr. **Burr**: One moment. I offer this in evidence.

Mr. **Mathewson**: Before it is offered in evidence, I would like to ask a few questions in reference to its origin, to see what these figures mean, I would like to understand them.

Mr. **Burr**: You may proceed.

By Mr. **Mathewson**:

2283 Q. Where did you get your record of sales for the year 1905 of the other companies than the Consolidated Gas Company?

A. Referring to the key at the [illegible] of the blue print, T is the testimony before the Gas and Electricity Commission, 1905, 1906; B-D is Brown's Directory of Gas Works; E is estimated.

Q. Was the testimony before the Gas Commission for these other companies given covering the output of gas for the calendar year 1905, or only for the nominal year ending October 31st, 1905, and which figures are these which you have used?

A. Taking the year 1905, if you like, the Consolidated Gas Company, 13,283,164,000 cubic feet is testimony gas?

Q. No. I am not asking you that. I am asking you whether the testimony before the Gas Commission was for the calendar year 1905 or for the nominal year Oct. 31, which figures you have taken?

A. The calendar year 1905 is used in the case of the Consolidated Gas Company.

Q. What about the other companies?

A. In the case of the Standard Company it is taken from Brown's Directory. In the case of the New Amsterdam Company it is estimated. In the case of the New York Mutual Gas Company it is taken from Brown's Directory.

Mr. Burr: What is Brown's Directory?

Mr. Mathewson: Just a moment. I do not understand these columns and I wish you would explain them.

Mr. Burr: He is going to explain it after I offer it in evidence.

Mr. Mathewson: I know, but I want to know what it is first.

Mr. Burr: I will proceed with my examination and let him go on and testify, if you object to its going in now.

2284 Mr. Mathewson: I certainly do object to its going in. The statements here are not statements of facts as to the output of gas of other companies. Some are estimates and some are from Brown's Directory, which is not in evidence in any proceeding I have ever heard of. I would have to object to this on that ground alone.

The Master: I think the best way would be to let this go in and you can cross-examine if you please about it. I do not see that you are going to gain anything by objecting to it now.

Mr. Burr: And it will simplify his examination.

Mr. Mathewson: I think I should take the objection because I do not think that statement from Brown's Directory which appear on statements which purport to be statements of fact are evidence at all.

The Master: That goes to the question of the soundness of his conclusions, as to whether they are based on facts that are in evidence here or whether they are not, but I think as showing the basis of the witness' conclusion as to which he has testified, that this diagram had better go in now and you can cross-examine about it.

Objection overruled.

Mr. Mathewson: Exception.

Mr. Burr: Adopting your suggestion I offer it in evidence.

Paper received and marked City's Exhibit 46.

By Mr. Burr:

Q. Now then as I understand you, Dr. Marks, this chart, marked City's Exhibit 46, of this date, shows the record of sales of gas per capita, and also the record of total sales of each and every gas company furnishing the Island of Manhattan. 2285

A. That is exactly the case.

Q. Beginning with the year 1888 and ending with January 1st, 1906.

A. It presents to the eye the record of the sales of gas per capita and also the record of total sales of each and every gas company furnishing the Island of Manhattan beginning with the year 1888 and ending January 1st, 1906.

Q. Why did you select the year 1888?

A. Because it was at that time I knew from my personal experience that electric lighting was becoming a serious factor on the

Island of Manhattan. I was engineer-in-chief of the Edison General Company in the year 1889 on the Island of Manhattan for a brief period.

Q. And electric lighting has from that time shared the field of public lighting with gas, has it?

A. It has.

Q. You may proceed to explain this chart?

A. There is still another reason for making this a record of the sales of gas on the Island of Manhattan itself rather than referring to precedents derived from other companies in other localities, in giving an accurate prediction on the effect of the reduction in the price of gas in the Island of Manhattan. New York is not comparable, so far as Manhattan is concerned, with any other city in existence, in its area, or in the character of its business and residence structures, and therefore one might easily be misled by using data derived from other cities. The evidence as to sales of gas heretofore given by Vice-President Addicks or by President Alexander C. Humphreys has not been founded on the broad basis of the consumption of gas by all the inhabitants from all the companies selling gas on the Island of Manhattan. Nor have these gentlemen taken up and discussed the effect of the reduction made in the price 2286 of gas in the years 1899 and 1900, which would throw a clear light on the probable response in increased gas sales per capita, which will result upon fixing the price of gas at 75 cents to the City and at 80 cents to the private consumer of Manhattan. Had they founded their reasons upon the broad basis of a consideration not only of the Consolidated Gas Company, but also of the Standard, New York Mutual and the New Amsterdam Companies, and then traced back the history of the sales of gas per capita at the various prices fixed, they would concur with me in the belief that a reduction of the price of gas to 75 cents, and 80 cents will in all human probability be largely profitable to the Consolidated Gas Company, as well as beneficent to the consumer of gas.

Mr. MATHEWSON: No, Mr. Master, I must object to this philosophical discussion and summing up. It seems to me that this is utterly improper. I do not know, if we followed the same course, how long it would take us to deliver our addresses.

Q. Now refer to the chart in detail, Doctor?

A. Referring now in detail to the chart, and to the point of its concurrence with the testimony at page 1924 we have the following comparison with the prices stated by the Consolidated Gas Company.

Q. You may read those.

A.—

1888	Consolidated Gas Co.,	$1.2566	Chart,	$1.26

The figures for the total sales of gas given on the chart are in the case of the Consolidated Gas Company taken from the testimony and the key letter is T. The total gas sales of the Standard Gas Company are taken from the testimony before the Gas and Electricity Commission, and from Brown's Directory of Gas Works; the key letter of Brown's Directory is B. D. The total gas sales of the New Amsterdam Gas Company are estimated, an allowance being made for its delivery to the East River Gas Company in Long Island City, and the balance being charged to the Island of Manhattan; the key letter for estimates is E. The total sales of the New York Mutual Gas Company are either taken from the testimony or from Brown's Directory.

Referring to the population, it is taken from the United States census of 1890 and 1900, and the State Census for 1905, as indicated on the map. All of the intermediate populations are necessarily estimated, and these estimates are carefully checked from a pamphlet published by the State for election purposes, obtained from the Secretary of State, and from the Board of Health Statistics as to the population furnished by Commissioner Darlington.

Q. How do you obtain the output per capita for each year?

2288 A. The output per capita for each year is obtained by dividing the total gas sales for each year by the population of it. It is of interest to observe this output per capita as it forms a very important factor. In the year 1888 it appears to be 5,626 c. f., and this steadily rises with gas at $1.26 to the year 1893 when it reaches 6,381 c. f. In 1894 it appears to fall off slightly to 6,344 c. f., and again in 1895 falls to 6,321 c. f., rising again in 1896 to 6,370 c. f. In 1898 with gas at $1.15 it rises to 6,595 c. f., and again with the advent of the reduction of prices about May 1st, 1899, it rapidly rises to 8,128 c. f. for the year 1900.

It will be observed that in the gas war, during which the Consolidated Gas Company, New York Mutual Gas Company and the Standard Gas Company reduced the price of gas to sixty-five cents and the New Amsterdam Gas Company reduced the price to fifty cents, the sales per capita rose with extraordinary rapidity, although the reduced price of gas extended only from May 1st, 1899 to about May 20th, 1900. The average reduction in the price of gas during the two years 1899 and 1900, was thirty-three cents and the sales per capita increased 1,533 c. f. Dividing this by thirty-three cents, we can see in a rude way that the sales per capita increased 46.46 c. f. in these two years for each one cent of reduction in selling price. Upon reflection it is obvious that the raising of the price of gas to one dollar in 1900 would be likely to put a stop to the increase of the sales per capita and it did so.

Q. Is that verified by the chart?

A. It is verified by the chart, which shows that during the year 1900 the sales per capita 8,135 c. f. remained at a standstill, and in 1901 the sales per capita steadily increased until 1904 when it reached 9,426 c. f. In 1905, however, we find that the sales per capita appear to have reached 9,250 c. f., having fallen back
2289 from the sales of 1904 by an amount of 176 c. f. On page
1782 of the testimony Vice-President Addicks corroborated the statement of Alexander C. Humphreys which is as follows:

"To-day, if my information is correct, and I believe it is, New York is selling more per capita than any other city in the world. It is selling 9,200 cubic feet annually per capita. A little less than that, about 9,150 c. f. I think it is. London is selling somewhere between 8,000 and 8,500 c. f."

And the statements of these two gentlemen very closely corroborate my own figures, which are sales per capita of 9,250 cubic feet. From what goes before it appears probable that these gentlemen have fully corroborated the figures of this graphic record of the sales of gas——

Mr. MATHEWSON: I move to strike that out—"from what goes before it appears probable." Whether they have or not appears from their testimony, and I do not think the witness should state that fact.

The MASTER: That of course is objectionable, but, Mr. Mathewson, are we not going to save time by letting the doctor, who has prepared this careful statement of his position, proceed with it?

The WITNESS: It appears probable that these gentlement have fully corroborated the figures of this graphic record of the sales of gas, which has been worked out independently and checked up by two of my assistants.

Q. And yourself.

A. Worked out by myself independently and checked up by two assistants.

Q. What degree of accuracy do you claim for these figures?

A. With an accuracy sufficient for all commercial pur-
2290 poses. The facts in regard to the increase of the sale per
capita appear to have been correctly related on the chart up to the year 1905. We have learned from the period of the gas war, 1899-1900, covering about one year, that each one cent of reduction in the average price of gas corresponded to an increase of 46.46 cubic feet. It would appear to be justifiable if we assume a period of two years, extending from January 1, 1906, to January 1, 1898, which is just the same as the period of the gas war, to infer that a reduction of 20 cents or from one dollar to 80 cents in the price of gas would produce an increase in the output per capita of about twenty times

46.46 cubic feet or 920 cubic feet, making the average sales per capita for the year 1907, 10,179 cubic feet as shown on the chart.

In order that this sale per capita may be reached, it will be necessary that during a period of twelve months out of the two years, the price of gas should be held at 80 cents.

By the Master:

Q. What do you mean by that, twelve months out of the two years?

A. The gas war in itself occupied the last half of 1899 and the first half of 1900, and the period at which I can get figures began at the beginning of 1899 and ended at the end of 1900, and for that reason I dared not venture on a prediction beyond two years, that is, to the end of 1907. Since the end of 1905 to the end of 1907 is exactly the same as the end of 1898 to the end of 1900——

By Mr. Burr:

Q. Having reached that point of the probable sales per capita for the year 1907, assuming the selling price to be 80c. for twelve months, what more do you find it necessary to do?

2291 A. It will be necessary to take a broader view of the conditions and factors affecting the sale of gas than has yet been given to them. The increase in the total sales of gas in any city appears to increase with the population, whatever the price of gas may be, and therefore a growing community will furnish a growing business to a gas company, even though the citizens of that community may regard the price fixed for gas as extortionate.

On the other hand, it is quite easy by fixing the selling price of gas at a rate satisfactory to any community, by the introduction of gas stoves. Welsbach burners and careful service, to considerably increase the sales of gas in a community which has ceased to grow in population, and this is done by increasing the output per capita. If, however, the population of a community is increasing, and at the same time the wise and energetic effort of the gas company also increases the output per capita the gas corporation will be so very fortunate as to realize a very great increase, both from the increased population and the increased sales per capita.

All our experience goes to show that the most lucrative field for the establishment of gas works is in a densely populated metropolis in which a vast business is being transacted, and the manner of living is luxurious, and in these qualities the Borough of Manhattan, in the City of New York, excels all other cities in existence with the consequent result of selling more gas per capita than is possible in any other metropolis in the world.

By the Master:

Q. May I ask a question. What is the purpose of this collection of figures down in the lower left hand of the diagram?

2292 A. The total output of each one of the four companies is arranged under columns headed by their names.

Q. Well, total output for what period?

A. For one year and each year. Beginning on the right hand side the four companies are arranged in four columns; following them down, these four columns are broken and shifted to the left hand side, having exactly the same heading, merely as a matter of convenience to allow the laying down of the line of progress of the output per capita of gas as it chanced to come from these figures. To the extreme right headed, "Approximate," there are four columns which give total results. These it is convenient to keep in one column, going down the extreme right.

By Mr. Burr:

Q. With this statement of the actual facts of the experience of the Borough of Manhattan, you are able to hazard the prediction as to the sales of gas per capita and total sales of gas for 1907?

A. I can. The population of the Island of Manhattan during the five years from 1900 to 1905 has increased at the rate of 52,457 per year, and we can therefore safely predict an additional population of 104,914, for the year 1907, making the total population when added to that of 1905, 2,217,295, on the Island of Manhattan. Multiplying the sales per capita, 10,179 cubic feet by this population, we obtain a total sale of gas for the Island of Manhattan, during the year 1907, with the price of gas at 80c. or a little lower, of 22,569,845,805 cubic feet, which at 80c. per 1,000 cubic feet, would yield a revenue to the four companies supplying Manhattan Island of $18,055.877.

2293 Referring to the chart for the data of 1905, we find the sales of gas for the Consolidated Gas Company to be 13,283,164,000 cubic feet, and the total sales of gas for the whole Island of Manhattan to be 19,540,243,000 cubic feet, so that the Consolidated Gas Company did sell 67.98 per cent. of all the gas sold in the Borough of Manhattan. The total revenue from the sales of gas in the Borough of Manhattan for the year 1907 should be about $18,055,877 and 67.98 of this is $12,234,385.18, and the diminution of revenue from the sales of gas by the Consolidated Gas Company as compared with 1905, ought to be about $956,557.18, instead of $2,646,188.47, as was stated by the complainant, by inference.

The question of the accuracy of these figures will at once arise, and it is proper to say that it cannot be claimed that they are given with scientific accuracy, but it can be claimed from these figures that they are sufficiently accurate and quite as accurate as figures ordinarily used for commercial purposes, and that they possess the decided advantage of being based upon the actual history of the sales of gas on the Island of Manhattan as far back as the year 1888, and therefore include not only the competition due to a steadily growing electric lighting business, but also the record of the great increase in sales per capita due to a lowering of the price of gas to consumers during the years 1899 and 1900. In fact, the advent of electric lighting appears to have stimulated the consumption per capita of gas by stimulating the desire for more brilliant illumination.

It will be noted that I have ventured upon a prediction only of two years from January 1, 1906. That is because I have only the record of the effect of a reduction in the price of gas for two years.

The interval during which this reduction in the price of gas was in actual operation was about twelve months in the two years, and if the price of gas is put at 80c. in 1907, it is fair to assume that a proportionate increase in the output per capita and in the 2294 total output of the Consolidated Gas Company to about 15,340,000,000 cubic feet will occur, if we assume that the four companies now engaged in lighting Manhattan share pro rata in the increased sales due to a uniform reduction in price.

Recess until 2.15 P. M.

After Recess.

Mr. Burr: I omitted to say this morning that with regard to the franchises, the gentleman representing the Company, and the gentleman representing the corporation counsel are still going over those documents and as soon as they have finished I will make my motion with regard to those.

Mr. Mathewson: I wish to say, Mr. Master, in view of the motion that has been made, and the statements made this morning by counsel, that the first motion for leave to inspect the plants was withdrawn as stated. The second motion was made in my absence—I have only returned this morning and knew of it this morning. I stated to Senator Page before the first motion was made that it quite likely would be necessary to make a motion to examine the plants because while we thought there was no power in the court to order it, I thought we might consent to it, and I have now conferred and am in a position to say that so far as the plants are concerned, that the defendants' proposed witnesses may examine the plants, beginning to-morrow morning if they please, without their motion, and this conclusion is reached wholly regardless of the fact that 2295 the motion was made, because the suggestion was made and my statement to Senator Page was made before any motion was made. As to the books, as your Honor said, those that have been requested have been produced and any other books pertinent could be no doubt called for and I think counsel for the defendant will conclude that that portion of their motion is not profitably pursued. However, as to the plants I have made the statement.

Mr. Burr: I am glad to hear the statement made by Mr. Mathewson and that he has now arrived at that conclusion. He will remember it is sometime ago that he and I spoke about the matter and he said he would see me and talk on the inspection of the plant later. I never got any definite suggestion or statement from him until just this moment.

Mr. Mathewson: I said I would consider it later and I would inform you and I have so done. No request was made to counsel for complainant before either of these motions was made to state finally whether we would permit an examination of the plant.

Mr. **Burr**: I beg your pardon. I refer you to the index of the case so far, and on the first page you will find the heading "Accounting, suggestion of Mr. Burr, Page 9," and "inspection of plants, suggestion of Mr. Burr, page 9." That was the first thing we did, before we started in to take the testimony.

Mr. **Mathewson**: Yes, and I said we would consider it and I would take this matter up.

Mr. **Burr**: And now you have taken it up.

Mr. **Mathewson**: Yes, sir.

Mr. **Kirby**: May I ask if that permission carries with it the furnishing to the defendants of a copy of the inventory as pre- 2296 pared by Mr. Mayer? The testimony, as you will remember, was based upon that inventory and is in such shape as to make it a practical impossibility for the defendants' experts to work with it, and would either mean a preparation of an inventory from that or the examination of plants aided by the testimony, which would take many weeks; or if a copy of the inventory as prepared by Mr. Mayer, (and as you will remember, he brought it in typewritten form,) was furnished to the defendants, that is without any valuations thereon, it would materially aid them in their inspection and appraisal thereof and would, based upon such information as I have had from our experts, save not days but weeks in their examination and appraisal.

Mr. **Mathewson**: I don't know as to that. That inventory is not ours and was not made by us. It is the personal property of Mr. Mayer. I don't see how I could undertake to furnish it. In the second place counsel for the defendants had full opportunity to go into such details as they chose on his cross-examination, so I could not answer that.

Mr. **Kirby**: Well, we make that request and inasmuch as this motion is to be argued on Friday it would mean much longer time to make an examination and appraisal if it were not furnished to us than if it were. And as far as not being the property of the Consolidated—I think we will find in the record and if not in the testimony I think it was stated here that at last the complainant had a complete inventory of its works and apparatus and that it was now a record and part of the books and of the information of the company.

2297 Mr. **Burr**: I join in the request because it is undoubtedly the fact that if furnished with an inventory it will save the time of the experts that we will have to examine the plants, and for that reason I hope that the company will see its way clear to furnish us with a copy of it.

Mr. **Kirby**: And I might further say, Mr. Master, that inasmuch as this motion was adjourned until next Friday, certain engineers whom we have retained for this matter have been informed that no opportunity, if it were, could be given them until a week from today to make that inspection, and therefore they are not in the city and could not go into the work to-morrow under this permission which has now been granted us.

Mr. **Mathewson**: That is your affair, Mr. Kirby, with your engineers. You should have made your motion long before if it was necessary to make a motion.

Mr. Kirby: I am simply speaking for the moment and not as to what might have been done.

Mr. Mathewson: As to the inventory, I should personally have some objection to giving it in the form that it is, so far as I know its contents, because where it is made by Mr. Mayer for his own personal reference, he knows precisely what the article is, and a brief description might not give you the information and an inspection would. I should think it would.

Mr. Kirby: It would not.

Mr. Mathewson: And it might mislead you in some way and you might take that and say this thing is worth so much whereas there might be appurtenances to it included in the general description of the article, which if your experts had considered would have 2298 added a value and made it what Mr. Mayer stated it was.

Mr. Kirby: My suggestion was merely as a matter of expediency. If the inventory is not furnished we will simply have to make one of our own, which takes more time.

The Master: Meanwhile, Mr. Kirby, do not omit to get your experts in here as soon as you can.

Mr. Burr: The situation now, as far as the City is concerned, is this. Dr. Marks, our chief expert, is on the stand, and will take some time to finish his testimony, he could not be examining the plants while he was testifying, so I suppose that will be a matter which will be arranged to the satisfaction of both sides. At least I hope so.

Mr. Kirby: There is no doubt that the Master will agree that it would save time to all concerned that the examination be done by the City and State jointly rather than by each separately, and we have made arrangements to that end. If Dr. Marks could be released so that we can go on, I think probably not to-day but within the next two or three days we should be able to go ahead.

William D. Marks resumes the stand.

Direct examination (continued):

By Mr. Burr:

Q. Referring to the cost of manufacture and distributing gas of 22 candle-power, will you tell us what investigation you have 2299 made upon that subject, if any, and what study you have given to the testimony produced here and at the other investigations regarding that subject?

A. Before taking up Exhibit 94, I made a very large number of investigations of the cost of making gas and of the method of computing their costs in a good many different works, not only here but also in England. The same difficulty applies to a consideration of the cost of making gas as applies with regard to the previous question of the sales of gas per capita. It is made on so enormous a scale that the precedents derived from the smaller companies or even from the larger companies did not apply in the case of the Island of Manhattan. Referring to Exhibit 94, called "Summary of Operations for the Calendar Year 1905," I would say that owing to the extraordi-

CONSOLIDATED GAS COMPANY OF NEW YORK.

SUMMARY OF OPERATIONS FOR THE CALENDAR YEAR 1905.

PAGE BOUND VERTICAL IN BOOK

nary obstacles placed in the way of a proper investigation by independent and impartial experts in accounts, and in the manufacture of gas, which have resulted in the facts that there has been no examination of the works of the Consolidated Gas Company, and also that there has been no comparison of vouchers with accounts, guaranteeing that these vouchers have been properly distributed to their respective accounts, and further that there has been no examination of a complete nature of the subsidiary books, or of the final books made by impartial experts in accounts and the manufacture of gas, in behalf of the city of New York; has rendered all of the items in Exhibit 94 either doubtful or obviously to be rejected.

Mr. MATHEWSON: I object most seriously to the witness going on in this way and characterizing and stating that no opportunity has been given to examine accounts when everybody in this room knows that they have been given that. I do not think it is proper 2300 nor fair for the witness to proceed with a diatribe of that character. It seems to me he should testify and not characterize or sum up. I do not wish to be importunate, but it does seem to me that is not proper.

Mr. BURR: The record must speak for itself in that regard.

The MASTER: Yes, the record speaks for itself in that regard, and therefore it is unnecessary for the witness to testify in this fashion.

Q. Proceed.

A. Even if all the figures and computations that are on the books of the Consolidated Gas Company are correct and exact, the distribution of these figures from the vouchers still remains a matter open to discussion between experts who are sincere in their views as to the proper distribution of them.

Further an agreement should be reached as to the proper distribution of costs as represented by the vouchers, to their various accounts, and there still remains the question of what accounts are justly chargeable to the cost of gas or operating expenses, and what should go to the capital account or the cost of the works.

For the purpose of instant identification of the items in Exhibit 94, they have been numbered from 1 to 76, as per the following tabulation:

By Mr. MATHEWSON:

Q. Is that tabulation or paper just referred to by you Exhibit 94?

A. Exhibit 94, with the items numbered from 1 to 76.

Q. Simply the numbering of the items?

A. That's all. I am reading it according to Mr. Burr's request.

(Here follows table marked p. 2300*a*.)

2301 The WITNESS (continuing): Item 70, total operating, is given as $9,936,910.42 or 74.81 cents per M. c. f. of gas made, distributed and sold.

The items which I eliminate because they obviously are not chargeable to the cost of gas, are as follows:

Item 47, Repairs to gas stoves......	55,954.35	00.42	M. c. f.
Item 53, Street lamps............	289,259.09	2.18	"
Item 54, Int. on Consumers' Deposits	51,391.52	00.39	"
Item 67, Contingent Expense......	1,328,316.37	10.00	"
Item 69, Fixed Charges..........	972,423.44	07.32	"
Total rejected items.........	2,697,344.77	20.31	"
Balance doubtful items......	7,239,565.65	54.50	"
Item 70......................	9,936,910.42	74.81	"

By the rejection of the above stated items, we find the total operating costs to be $7,239,565.65, and the actual cost of gas appears to be 54.50 cents per M. c. f. made.

An investigation made into item 66, taxes $965,843.88 or 7.27 per M. c. f. is as follows:

Taxes on Real Estate..........................	$179,778.95
" " Personal Property......................	88,839.00
" " Special Franchises....................	406,909.23
" " Mains, Pipes, etc.......................	14.91
" " Income from Gas Business.............	70,538.02
Total	$746,080.11

2302 Taxes on Income from other Companies' Securities	$5,257.48
Taxes on Dividends in excess of 4 per cent. on $38,643,590.14, Stock invested in securities.......	57,965.39
Taxes on $41,356,409.86, Stock in gas business......	62,034.61
Interest on unpaid taxes.........................	94,506.29
	$219,763.77

We observe that instead of items 66, Taxes, $965,843.88.

We should have $746,080.11 or 5.61c. per M. c. f., showing a reduction of 1.66c. per M. c. f., which subtracted from 54.5c. per M. c. f., gives 52.84c. per M. c. f. for the apparent cost of gas up to this point.

Referring to Complainant's Exhibit 224 and to Item 62, Real Estate Rents $42,674.71, or 00.32c. per M. c. f., we find that for the calendar year the Real Estate Rents received amounted to $37,408.88, leaving a balance of $5,265.83, or dividing by 13,283,164 M., or about .04c. per M. c. f., which subtracted from 00.32c. leaves 00.28c. Subtracting this 00.28c. from 52.84c. we have 52.56c. for the present figures on the apparent cost of gas.

Item 67, Contingent Expenses $1,328,316.37, or 10.00c. per M. c. f. has been omitted, and so far as possible, should have substituted for it the actual renewals.

Referring to the testimony before the Gas and Electricity Commission of New York, it appears that this account was sophisticated by the introduction of a theory, and the actual renewals hidden within the 10c. per M., arbitrarily fixed as the cost of contingencies and renewals.

2303 On Page 1183 Printed Testimony, Gas and Electricity Commission, it is $194,666.87, or 1.45c. per M. If we add this sum to the apparent cost of making gas 52.56c. we have 54.01c. per M.

Referring to Exhibit 224, Page 759, we find the gas stove rents for the calendar year to be $122,322.60. Refer to Item 47, Exhibit 94, repairs to gas stoves, and we find the expense to be $55,954.35. The difference between these is $66,368.25, or 00.50c.

If, according to the English custom, the credit for stove rentals, or the cost of stove rentals, is entered into the cost of gas, this latter account would reduce the apparent cost of gas to 53.51c. per M. c. f.

It will be observed from this discussion of Item 47, Repairs to Gas Stoves, and Item 62, Real Estate Rents, that the apparent cost of gas is increased by putting into it the expenditures under these heads, and then adding the receipts under these heads to miscellaneous income, with the result of increasing the receipts from gas sales to over $1.00 per M. c. f., which is obviously absurd. Now we come to

Review of Rejected Items.

Item 53, Street Lamps, $289,259.09 is analyzed as follows:

Page "15."

Labor, fitting, repairing, lighting, extinguishing, cleaning and inspecting	$15,864.70
Pipe fittings	1,959.91
Glass	86.70
Repaving	3,849.65
Welsbach Street Lighting Company (for Mantles)	321,316.93
Sundries (Materials)	17,595.60
	$360,854.69
Credit	71,595.60
Total	$289,259.09

2304 Item 54, Interest on Consumers' Deposits $51,391.52. These Consumers' Deposits are demanded by the Gas Company as an insurance against loss from irresponsible consumers, and these Consumers' Deposits amount to $904,520.07 (See Complainant's Exhibit 81).

Interest at 6 per cent. is claimed to be paid on these deposits, and should be paid, because, in addition to forming an insurance fund against loss, it furnishes nearly $1,000,000 working capital for the purposes of the Consolidated Gas Company, but it forms no part of the cost of making gas.

Item 67, Contingent Expenses, $1,328,316.37, is a purely arbitrary assumption, not even based on empirical data. It has been explained above that the actual contingent expenses for twelve months ending October 31, 1905, amounted to $194,666.87, or 1.45c. per M. c. f., which has been added into the apparent cost of gas.

Item 69, Fixed Charges $972,423.44 or 7.32c. per M. c. f., has been relinquished as a charge by the experts of the Consolidated Gas Company, although they, in former investigations before other Commissions, presented it as a proper charge against the cost of making gas.

It is obvious that both Item 69, Fixed Charges, and Item 54, Interest on Consumers' Deposits, is interest on money which the Consolidated Gas Company has found it more convenient to borrow than to furnish and invest.

It would appear from the foregoing examination of items, that each of the items which has had the consideration of an expert in gas manufacture, required modification or rejection.

The fact that accountants for the State have found the computations, meaning by that the additions, subtractions, divisions, and multiplications entered on the various accounts, to be correct, is no proof that the accounts themselves have not been sophisticated by a wrong distribution of the amounts of the vouchers or that the cost of gas has not been sophisticated by a subsequent incorrect distribution of these accounts in Exhibit 94. 2305

It is not possible for a mere accountant, familiar only with figures, and unfamiliar with the practical processes of gas making, to authoritatively determine the distribution of vouchers to accounts, nor, assuming these vouchers to have been propertly distributed, to determine the proper accounts which should go to operating cost, and which should go to capital or investment accounts.

It is a fact that a complete examination of vouchers and their distribution, and an examination of accounts and their distribution, has not been made by the Stevens Commission, Senate Document 30, 1905, or by the Gas and Electricity Commission, 1906.

Mr. Mathewson: I object to the statement of the witness. If there is anything to show from those records which is pertinent, and if they are pertinent evidence, the evidence as to what they show and what was done is the record itself and not the statement of this witness.

Mr. Burr: If he is familiar with the record and makes it as a statement, you can deny it later.

Mr. Mathewson: I do not think we ought to be put in that position.

The Master: It does not seem to me that it is proper testimony. I think we are allowing considerable latitude in letting the witness go on and present his statement, but when he gets into matters

2306 which are more properly matters of summing up and characterizing the testimony as a whole, I do not think it ought to go in.

Mr. **Burr**: Very well, sir. It is not very material. Leave that out. Proceed.

The **Witness**: Referring to witnesses—President Alexander C. Humphreys, of the Stevens Institute of Technology, who was retained by the Consolidated Gas Company and who assumed the attitude of one having an enormous experience and undisputed authority, acknowledged on the stand that he had not examined the vouchers and accounts of the cost of gas, but has blindly accepted the figures furnished by the officials and employees of the Consolidated Gas Company.

Mr. **Mathewson**: What is the use of the witness stating that if that is the fact. I move to strike it out.

The **Master**: Why, yes; that is not testimony. Of course the witness is entitled to give us his views on this subject, or any facts or figures or anything which is in evidence before me, but it is not a part of his evidence to say here that some other witness planned or did something else.

Mr. **Mathewson**: Dr. Humphreys took the testimony as presented here and then presented his statement of the cost of gas from that.

The **Master**: What I understand the Counsel objects to is the characterization on the part of the witness and he contends that it is no part of his testimony.

Mr. **Burr**: You might strike out the word "blindly."

The **Master**: You had better have the witness leave out the speeches and the characterizations.

2307 By Mr. **Burr**:

Q. Referring to the testimony which was given by President Humphreys on pages 1943, 1944, 1945, 1946, 1947, 1948, 1949 and 1950 of this record, is it not a fact that he accepted the unverified figures of the officials and employees of the Consolidated Gas Company for 51.802 cents per M c. f. sold (page 1945) by the rejection of contingent expenses and repairs.

Mr. **Mathewson**: Objected to as simply a characterization of the testimony by the witness which it is not proper for him to make.

The **Master**: Oh, he can state that, I think.

A. It was a fact.

Q. And does he not proceed to add for average repairs from 1884 to 1905, and for final renewals the sum of 14.145 and reaches a cost at burner of 65.947 cents per thousand cubic feet sold?

A. He does.

Q. Now you heard the testimony of Mr. Bradley as it was given on page 2018 of the record here that "most of the water gas apparatus has been built within the last five years, and is just as modern and up-to-date as any we can contract for today."

A. I did.

Q. And in the statement appearing in Mr. Bradley's affidavit, page 35: "The manufacturing plants of several of the constituent companies which formed the Consolidated Gas Company in 1884, were originally coal gas plants, but at the present time, they have been replaced with water and oil gas plants of the latest and most improved methods, that the maximum daily capacity of the water and oil gas plants of the company is 41,500,000 *thousand* cubic feet out of a total manufacturing capacity of the gas plants in operation, amounting to 51,000,000 cubic feet. This computation does 2308 not include the 18th Street plant with a daily capacity of 3,500,000 cubic feet, for the acquisition of which condemnation proceedings have been instituted by the City of New York." And, further, the statement in the affidavit of President Walter R. Addicks, page 6: "The manufacturing plants of the Consolidated Gas Company are in good and efficient condition. About 4/5 of the present generating capacity thereof, are in the shape of modern, up-to-date water gas plants which could not be improved upon anywhere. And the coal gas plants, while possessed of some apparatus which is not of the latest pattern, are efficient, and in shape to operate for an indefinite period without impairment of efficiency." What do you conclude from these statements to which I have called your attention?

A. That the repairs themselves should be and are very low. I should say from the statements of Chief Engineer Bradley, and Vice-President Addicks, showing the coal gas plants of about one-fifth of the capacity, to be in as perfect a state of repair as possible, and that the water gas plants 4/5 of the capacity, have all been renewed and replaced within five years in the most modern methods possible, would appear conclusively——

Q. What do you deduce from those statements?

A. First, that taking an average of repairs from a number of coal gas plants, between the years 1884 and 1900, in connection with the repairs to the modern water gas plants from 1900 to 1906, is a very adroit method of padding the apparent cost of gas by using the higher repairs of old-fashioned smaller coal gas plants for the new and larger water gas plants.

Q. What have you to say with reference to the five cents added to the cost of gas making allowed by President Humphreys, making the total cost and reserve 70.947 cents per thousand cubic feet sold.

A. This reserve is purely an arbitrary assumption. It is 2309 obvious upon reflection that if the methods of the English companies had been adopted, the reserve in hand in 1905, would have amounted to a very large sum indeed, far exceeding the real needs of the Consolidated Gas Company.

The English, as a general custom, set aside their profits.

First, an insurance fund, limited to five per cent. of the capital of the company, which is intended wholly for contingencies, accidents and large and unexpected demands above ordinary repairs, and

Further, set aside out of their profit, a reserve fund limited to ten per cent. of the capital of the company, which reserve fund is sued for the equalization of dividends in years, when the profits of the company may fall below the established rates of dividends.

The fact that the large profits of the Consolidated Gas Company may have been absorbed in the purchase of electric light corporations, or other gas corporations, at exorbitant prices, as well as the erection of new works at Astoria, is no justification for an assessment of five cents in every one thousand cubic feet of gas sold upon gas consumers.

Q. I call your attention to the testimony of Vice-President Addicks, as to the cost of gas per thousand sold on page 1757 of the record and ask you if it is not a fact that he omitted fixed charges, contingencies and a portion of the taxes, amounting to 17.81 per thousand and then added for enrichment, replacements, repairs and renewals, and labor, 9.35 cents, also 3 cents for a reserve, which is two cents less than is claimed by President Alexander C. Humphreys?

A. That is so. During the year 1905, the standard illuminating power of gas was fixed by law at 20 candles until July 1st, 2310 and after that at 22 candles. An averaging of the results of observations made by Chief-Examiner Love——

Q. Who is he?

A. Chief examiner for the city of New York. An examining of the results of observations made by Chief Examiner Love of the candle-power each day during 1905, gives the candle-power for the first six months, about 22 candles, and for the last six months above 24 candles, and in both cases proves the extravagant use of oil for unnecessary illuminating power.

Q. Is this a copy of the statement made by Dr. Love?

A. It is. It has been carefully computed and verified by two parties besides being generally arranged by myself.

By Mr. Mathewson:

Q. What do you mean by computed?

A. The Chief Examiner Love's affidavit was turned in on the days given, on the days you will observe, and the month given on the exhibit.

Q. But you say you have carefully computed, what do you mean by that?

A. He made in some cases two, in some cases three, and in some cases four observations of the gas of the Consolidated Gas Company which was necessary to compute an average of those for the days that were made, and then having reached those averages to compute the total average as you will observe at the bottom for the month, and then the total average for the first six months and then the total average for the last six months.

Mr. Burr: I offer that in evidence.

Mr. Mathewson: I do not object to it, subject to verification.

Received in evidence and marked City's Exhibit 47.

2311 By Mr. Burr:

Q. Proceed.

A. It is entirely proper to hold the illuminating power of gas at about one-half candle above a fixed standard, to provide for accidents, and oversights, but it is not necessary to exceed this amount. A careful manager using oil at 04.23 per gallon for enrichment in such vast quantities should effect a great saving in the course of a year without running any serious risk of penalties.

Q. What do you find is the average price for oil used, purchased at a fair average price, granted to smaller companies of 03.65 cents per gallon instead of 04.23 cents per gallon.

—. ——.

Q. What do you find is the average price of oil paid by the small companies to which you have referred?

Mr. **Mathewson**: Objected to. I submit this witness has no special knowledge on this subject and what he thought some small companies paid for oil where they could get it from anyone of a dozen different sources would be no criterion of what we have to pay.

Mr. **Burr**: If he knows what other companies are paying in other cities in the State of New York for oil he may state that fact.

The **Master**: I will allow him to answer.

Mr. **Mathewson**: Whether the witness has any personal knowledge or not, is it allowed?

The **Master**: No, he is to state what he knows about it. That is what the question is.

A. I have obtained through Brown's Directory a work used by gas managers and the data for which is communicated by officials of these companies, prices of oil in fourteen small companies in the State of New York, these prices averaging about 3.65 cents per gallon.

2312 Q. Will you give the names of the cities or towns where such companies are located?

	Per gallon.
Batavia, N. Y.	3½ cents
Binghamton, N. Y.	3.58 cents
Clifton Springs, N. Y.	3.00 cents
Fishkill, N. Y.	3½ cents
Fulton, N. Y.	3.1 cents
Half Moon Gas Company, N. Y.	3.37 cents
Middletown, N. Y.	3.75 cents
Nyack, N. Y.	3.75 cents
Oneonta, N. Y.	3.95 cents
Peekskill, N. Y.	4.00 cents
Plattsburgh, N. Y.	3.63 cents
Schenectady, N. Y.	3.58 cents
Syracuse, N. Y.	3.35 cents
Waterville, N. Y.	4.00 cents
Average	3.65 cents

Q. What do you say, Doctor, regarding the item given by Mr. Addicks as to "actual replacements," 2.12 cents?

A. Referring to Mr. Addicks' item "Actual replacements," 2.12, it would appear as if the actual replacements for the twelve months ending October 31, 1905, amounting to $194,666.87 or 1.45 cents per thousand cubic feet sold for the calendar year, did not corroborate his statement of 2.12 cents for a calendar year overlapping only by two months, that is (about $284,700.00).

Referring to Mr. Addicks' item for enrichment, 1.83, it will be recalled that the average requirement for the year 1905, made by law, was 21 candles, and therefore that as this average was largely exceeded (23.1) that this addition of 1.83 cents to the cost of gas is a wholly unnecessary extravagance.

Q. What do you say as to the extra item of "Repairs and Renewals," 4.62?

2313 A. Referring to the extra item of repairs and renewals, 4.62, deduced from the discussion of repairs and renewals in the five years 1895 to 1899, inclusive, the same objection applies as did in the case of President Humphreys.

Mr. Addicks has selected a period during which smaller and less perfect gas works were operated for the purpose of deducing repairs, which period being one of the final destruction of this apparatus, was immediately followed by the period of 1900 to 1905, in which Chief Engineer Bradley says "most of the water gas apparatus has been built within the last five years, and is just as modern and up-to-date as we can contract for to-day." It is apparent that Mr. Addicks is selecting the five years, 1895 to 1899, which is a period in which the old works were tottering to their final collapse. According to Mr. Bradley's testimony they did collapse about 1900 and were replaced by the latest type of water gas plants.

Mr. Mathewson: He selected that period as he testified because the Gas Commission suggested that that period should be taken.

Mr. Burr: I object to a running commentary on my witness. I protested in vain to the helps and aids to your own witnesses.

Mr. Mathewson: I think he should be more careful.

Q. Regarding the item of "Labor," 78 cents and "Reserve," 3 cents what have you to say as to that?

A. The latter three cents is a purely arbitrary assumption for which empirical data are not even offered, and the fact is that had usual and proper methods of operating and financing gas works been observed, there would have been in the treasury of the Consolidated Gas Company in 1905, a more than ample reserve for all possible needs. In this way Vice-President Walter R. Addicks obtains a net cost of 69.36 cents which coincides very closely with the 70.95 cents per thousand cubic feet of gas sold, reached by President Humphreys. 2314

Q. Do these periods selected by them show properly existing conditions of the works?

A. They do not.

Mr. Mathewson: I object to the word "properly."

Mr. Burr: Existing conditions.

Mr. Mathewson: How does he know except from the testimony? He has not examined the plant.

Mr. Burr: If he knows from the testimony here. If he knows they have not and he is given the period, and now he may characterize them that they are not proper to base their assumptions upon.

Mr. Mathewson: That is not the point. Your question is as to whether they represent the present condition of the works. Now he does not know whether they do or not, if he has not examined the works.

Mr. Burr: I ask for the period they take for their computation.

The Master: You might be able to show there is some failure in their line of argument based on an improper selection of periods other than that applicable but I do not think you can prove it by questioning this witness.

Q. Isn't it a fact that Mr. Addicks and Vice-President Humphreys have selected periods for the deduction of items of repairs which do not cover the existing condition of the works?

A. They have.

Mr. Mathewson: Objected to on the same ground as I did before.

2315 The Master: It is answered. You can ask him if you care to, to point out any defect or error which he claims to exist in that allowance for repairs, whatever it is.

Mr. Burr: He has stated the statements that have been made with regard to the condition, and also state the testimony of these gentlemen with reference to a particular period, and this is his conclusion.

The Master: It is proper for him to state why in his opinion the period stated by them is not fairly representative, but the question as you put it I think is objectionable, but you can get at the same thing by modifying the question. He has answered it now practically.

Q. What have you to say with regard to their statements regarding the use of oil for enrichment?

A. The oil has been used in excessive quantities, unnecessarily used for an expensive illumination.

By the Master:

Q. Do you mean to say they have made gas of richer quality than the law required?

A. 2.1 candles ordinarily.

Mr. Mathewson: We have been spending unnecessary money in order to reduce our own profits.

Mr. Burr: We will show you how to run the business after a while.

By Mr. Burr:

Q. What does the statement of Dr. Love show, Dr. Marks, with regard to the use of excessive candle-power?

A. In the first six months of the year 1905, the legal requirement

was 20 candles. Dr. Love's observation on the photometer
2316 either personally or by his assistants show that the average
illuminating power of the gas at the city station was 22
candles. In the last six months of the year 1905, the requirement by law was 22 candles. Dr. Love's observation during that six months made at the City's test station shows an average of 24.19 candles; nearly 24.2 candles.

Q. In excess of the legal requirements?

A. In excess of the legal requirements, and the consequence is that the average excess has been about 2.1.

Q. So that in your opinion, the oil necessary to make that candle-power was unnecessary and was wastefully used?

A. Yes, sir, and therefore Mr. Addick's addition of 1.83 cents or any addition whatever was entirely unnecessary.

Q. What is the method in your opinion, which should be pursued to avoid theories and to follow authoritative precedent as to the factors and items which enter into the cost of gas?

Mr. Mathewson: I object to the form of the question.

The Master: I think that is rather an objectionable question, Mr. Burr:

Mr. Burr: It seems to me he has pointed out some basis of the accounting of these experts on behalf of the Consolidated Gas Company which he believes he has demonstrated were improper, and I am asking what in his opinion is the proper way of figuring upon those subjects as factors going to make up the cost of gas.

The Master: Do you mean that the question generally was based on some of the evidence which already appears here in this case?

Mr. Burr: Based upon the evidence in this case and upon his experience and knowledge as an expert.

2317 The Master: Well, I will let him answer it then.

Mr. Mathewson: Exception.

A. There have been several suggested methods of obtaining the cost of gas.

Q. What is the practice in England, for instance?

A. The practice in England has been established by accountants and also approved and enacted by Acts of Parliament. There are other processes on this side which have not met with universal acceptance, such as the American Gas Association.

Q. What is the practice in England, for instance? Do they take in consideration anything——

A. In England the necessity of taking into consideration anything else than the actual cash expenditures incurred in the manufacture and distribution of gas is avoided by having the actual depreciation for each term of a year or six months, written off on the books, upon a carefully prepared report of the engineer of construction and carbonizing or the distributing engineer, or the superintendent of by-products works, and also requiring of each of these officials a further statement that the apparatus in his charge is in good order, and in a thoroughly efficient state of repair. These reports are attached to the regular report of the governor [president] of a gas company.

Q. While on that point I want to call your attention to the practice there with regard to furnishing accounts or keeping accounts. What is the rule? Is it not a fact that a taxpayer or consumer on the payment of a shilling may demand and is bound to receive a copy of the accounts of the gas company?

Mr. Mathewson: Objected to. The question here is what is the cost of gas. Whether a consumer is entitled to examine the 2318 accounts of the company upon paying a shilling, it seems to me does not have much bearing on the cost of gas.

The Master: Wouldn't it be better for you to refer me to the statute, if there is one, and put it on the record?

Mr. Burr: Yes.

Mr. Mathewson: I shall object to it even as a statute.

Q. What do you find is the result of the precautions and the insistence upon a thoroughly efficient state of repairs?

Objected to as immaterial and irrelevant.

Mr. Burr: This is on this point of depreciation and now we want to find out what is the system with other companies, the recognized standard, which differs from the standard set up by the Consolidated Gas Company and of which we now complain, so the Court may be enlightened on that subject and draw its own deductions.

The Master: It seems to me if you go into that sort of thing you are opening the door very wide by raising any quantity of collateral issues which the other side have got to come in and meet. I assume that the conditions of manufacturing gas are as different in different countries and different localities as day is from night—different rates of wages, different freight rates, different local conditions—a thousand considerations, and it cannot be that we have got to go in here and draw out the merits of each individual gas company all over the world and compare it with this. I think it is quite proper of course for you to put your expert on the stand here, one skilled and experienced in this business, and let him speak in a 2319 general way as to his knowledge of conditions prevailing elsewhere, and in the light of such knowledge let him test and criticise the statements of the complainant's experts; I think that is right enough, but when you ask him to go into details and the merits or demerits of the English system I think that is going pretty far.

Mr. Mathewson: I make these objections, among other things because before the Gas Commission I did not make them and let the witness go on and explain all the time on what seemed to me utterly immaterial and irrelevant matters and then when I desired to put on my experts in rebuttal I was met with the proposition I should have objected, that these things went in without objection and I could not meet them. I do not wish to be put in that position here.

The Master: Of course if I sustain the objection the answer is nevertheless taken. It is only a question of saving time. Is there much of this line?

Mr. Burr: Not at all. I just want to ask another question with reference to Exhibit 94.

The Master: Well, then, let him answer it.

The Witness: What is the question?

The Stenographer (reading): What do you find is the result of the precautions and insistence upon a thoroughly efficient state of repairs?

Mr. Mathewson: I object to that. I thought that question was ruled out.

The Master: I will overrule the objection and let him answer.

Mr. Mathewson: Exception.

A. The result is that the depreciation of manufacturing
2320 plants and the depreciation of meters usually form the principal items, and the depreciation charge is a very small percentage, sometimes only a fraction of 1 per cent. of the total structural cost of the plant.

Q. For the purpose of reaching the apparent cost of gas after the English method, have you examined and arranged Exhibit 94?

A. In order to——

Mr. Mathewson: I shall object to going into this. It seems to me utterly unprofitable to arrange Exhibit 94 after the English method.

Q. I will ask you what you consider is the proper method of segregating the accounts in Exhibit 94?

Mr. Mathewson: Has not the witness testified to that already and gone over it?

The Master: Let him answer.

Mr. Mathewson: Exception.

A. In order to confirm any personal opinion that I may have formed, I have taken the clearly defined and specified method used by English accountants in giving the cost of gas each year for public and judicial use. I have seggregated the accounts and the items stated in Exhibit 94 according to this method and having done that, have deduced a cost of gas by this segregation under the following heads:

1905.	Total.	Cost per M sold.	Percentage cost.
Net Coal	$2,647,276.18	25.40	
Mfg. Charges	807,818.19	7.77	
Distribution Charges	1,095,123.87	8.23	
General Expenses	751,345.94	5.65	
Management Charges, Law etc.	812,090.55	6.11	
Total, or apparent cost per M. sold	$6,113,651.73	53.16	

Q. Have you taken any measures to check that total with a comparison of Exhibit 94?

2321 A. To check this total with Exhibit 94 we add the following items. Total cost as above $6,113,651.73.

Item 53, Street Lamps..............	$289,259.09	
" 54, Interest on Consumers' Deposit...........................	51,391.52	
Item 59, Fixed Charges............	972,423.44	
" 67, Contingent Expenses.......	1,328,316.27	
Less.......................	194,666.87	1,133,649.50
Item 47, Repairs to Gas Stoves......		122,322.60
Item 66, Taxes....................		219,763.77
" 43, Cost of Gas Mfg. Agency Agreement....................		997,039.89
Item 63, Real Estate Rents..........		37,408.88
		$3,823,258.69

which added to $6,113,651.73 gives a check total of $9,936,910.42, corresponding to item 70 in Exhibit 94.

Q. And by that method the apparent cost of gas used is 53.16 cent per thousand cubic feet of sales?

A. That is right.

Q. That differs from the apparent cost of gas previously deduced, doesn't it?

A. That differs, in this respect, this .35 cents difference is the difference between Item 42, station costs, and Item 44, total cost at holder, and checks the computation in both cases, as in the first case total cost, Item 44 included Item 42, Station cost, and Item 43, gas manufactured under Agency Agreement.

Q. Did you take pains to further check the total result of these computations with Exhibit 94, and if so, state in what manner?

A. In order to further check the total amount of these computations with Exhibit 94, omitted items and partially omitted
2322 items have been added together and then added to the total
of the items, giving the apparent cost as 53.16 cents per thousand cubic feet. Item 70, Total Operating Expense, $9,936,910.42 exactly equals this amount and proves there are no errors in the computation, and further, Exhibit 94 has been carefully checked in every figure for the purpose of eliminating any possible numerical errors.

Q. Now, Doctor, what have you to say in regard to the items charged here on Exhibit 94 for insurance and reserve funds? Is that a proper charge or are these proper subjects for special allowance if required or demanded by a company which has confessedly, as in the case of the Consolidated Gas Company, made for a long term of years, the profits that the Consolidated Gas Company has?

A. It is obvious that the surplus applicable to both these funds would have been more than ample, had not the Consolidated Gas Company gone out of its province as a gas manuufacturer in the endeavor to obtain the monopoly of all forms of lighting in the Island of Manhattan and in Greater New York.

Mr. Mathewson: I move to strike that out. There we are again. He is not answering the question at all. The only question is whether it was a proper charge and he is entering into a discourse on our holding a monopoly of lighting. The question was whether that was a proper charge on the manufacture of gas.

Mr. **Burr**: I assume he was going to state his reasons. If you want to object——

Mr. **Mathewson**: I do object. I move to strike that part out.

(Question and answer read by stenographer.)

The **Master**: It is very difficult to separate that so as to strike out the objectionable portion.

2323 Mr. **Burr**: I will ask to have the answer stricken out and take the answer yes or no, and then ask for his reasons.

The **Master**: That is proper. It may be stricken out.

Q. What is the answer?

A. It is not under existing conditions.

Q. Why?

A. Because the Consolidated Gas Company appear to have spent their surplus in an endeavor to obtain control of all forms of lighting on the Island of Manhattan.

Mr. **Mathewson**: I move to strike that answer out.

The **Master**: I will let it stand.

Mr. **Mathewson**: Exception.

By the **Master**:

Q. What you mean by that is that the surplus has been expended in the purchase of securities of other companies?

A. Yes, sir.

The **Master**: That is the way it should have been stated.

Mr. **Mathewson**: Whereas the evidence is directly to the contrary.

Mr. **Burr**: I ask to have that stricken from the record.

The **Master**: Strike it out.

Mr. **Burr**: I do not believe Mr. Mathewson should make such statements.

The **Master**: No, but if you let your witness go on and get loose from the facts, you render yourself liable to that sort of interruption.

By Mr. **Burr**:

2324 Q. If the Consolidated Gas Company was in need of a reserve or an insurance fund, its proper procedure would be to form these funds out of the profits of these other purchases of securities in other companies.

A. It would seem entirely proper.

Q. Now, what have you got to say, Doctor, from your examination of the testimony here and your knowledge with regard to the situation at Astoria and the proposal of the Consolidated Gas Company to acquire the plant at that point?

A. It would seem to me that any suggested claim for an allowance to be devoted to the erection of gas works at Astoria is extortionate. Brooklyn and Queens County being rapidly populated and put into communication with the Island of Manhattan by bridges and tunnels as well as ferries, in another decade a gas consuming territory will be closely populated, in comparison with which the demands of the Island of Manhattan will be relatively small indeed.

Astoria with its proposed works of 240,000,000 c. f. daily capacity or 48,000,000,000 c. f. of annual capacity is an enterprise which can on an independent footing easily command unlimited capital and consumers on the Island of Manhattan are being subjected to either 3 cents or 5 cents or 10 cents per M. c. f. of sales for the purpose of building up this vast enterprise, whose future is guaranteed by every condition favorable to an almost unlimited sale of gas.

Q. I call your attention to the profits per M. c. f. of gas sold. What do you find the facts to be from your investigation?

A. By using the cost of gas manuufactured by the Consolidated Gas Company and the English method of computing the cost of gas, we have obtained an apparent cost of 53.16 cents per M. c. f. of gas sold.

Q. All of the information upon which these figures are based is derived by you from the transcript of the accounts of the company which have been furnished you?

A. From the unverified transcripts.

2325 Q. Except in the few instances such as Item 47, Repairs to Gas Stoves, Item 53, Street Lamps, Item 54, Consumers' Deposits, Item 62, Real Estate, Item 66, Taxes, and Item 67, Contingent Expenses, which have been partially analyzed and explained, is that true?

A. Yes, and they lead to the inference that every other item needs a thorough investigation——

Q. On Exhibit 94?

A. On Exhibit 94, needs a thorough investigation, not by an accountant for the purpose of seeing whether 2 and 2 makes 4, but by some expert in the gas business.

Q. And what in your opinion, what would be the actual cost of gas if an impartial and fair audit of vouchers relating to this item on Exhibit 94 were had?

Mr. **Mathewson**: Objected to as pure conjecture and speculation of the barest kind. If those figures are not correct, what can he conjecture if they were properly gone over?

The **Master**: I do not think that is very valuable testimony.

Q. Well, I will ask, in addition to that, based on your experience and upon your knowledge of the gas making business, and the conditions that you have ascertained exist here, from the investigations heretofore had and the present inquiry before the Master.

Mr. **Mathewson**: I object to that. The witness is not an expert in this line and he has not been shown to be and he never made gas in the City of New York.

The **Master**: I will let him state his opinion on the subject.

Mr. **Mathewson**: Exception.

A. It is difficult to say how low the price or rather the cost
2326 of gas may go under the conditions of enormous manufacture and quantity put out here in New York, and more particularly on the Island of Manhattan. It appeared to me at the outset

from figures which I had been able to obtain from smaller companies that there was a probability that the cost of gas would be somewhere between fifty cents and fifty-seven cents, that it would be found to be about that; but as I have gone on going into these matters, I have felt certain that the cost of gas would be found below fifty cents—I refer to the cash cost—how much below I do not know, but probably something above 44 cents.

Q. And less than fifty cents?

A. And less than fifty cents.

Q. Have you any knowledge of the gas situation as it exists in other cities in the United States in comparison with the conditions which have been revealed here by this testimony to exist in the City of New York?

A. The nearest approach——

Mr. Mathewson: I object.

The Master: Have you any knowledge, is the question?

A. I have.

Q. Of what cities?

A. In the City of Chicago I have the recent report of Hon. Lynn H. Young, Chairman of the Committee on Gas, Oil and Electric Light of the City of Chicago.

Q. What is gas manufactured and sold for there?

A. His statement is——

Mr. Mathewson: I object to that as immaterial and irrelevant, in the absence of testimony as to the local conditions, cost of material and other items.

Mr. Burr: I am asking for the fact: If he cannot justify
2327 it, it does not amount to anything.

The Master: I will take it.

Mr. Mathewson: Exception.

A. His statement is that the cost of gas in the City of Chicago of 22 c. p. based on an interrupted investigation made by accountants has reached 45.45 cents per M. c. f. sold.

Q. There was an investigation, was there not?

A. There was an investigation made.

Q. What was the holder cost of gas stated to be in that investigation?

Mr. Mathewson: If you have the record of the investigation there and the testimony exact, and if it is relevant at all, why not produce it instead of getting this witness to go over this subject.

The Master: I think that is a fair suggestion, Mr. Burr.

Mr. Burr: If he will state the fact, I will produce the evidence.

The Master: If the witness's only knowledge is the report of which he speaks, we might as well have the report here.

Q. Have you the report?

A. I have the report here.

The Master: I regard that evidence as of very little value, but I think under all the circumstances we might as well get all the light we can on this question under reasonable limits and put in the cost of gas in Chicago; but what I cannot understand is how it is at all relevant to what the gas companies claim was the cost there. Suppose they lied. He has testified that the cost was 45.45 cents at the holder. Now suppose the gas companies claimed it was $1.45.

Mr. **Burr**: But the condition is entirely different. They 2328 were yanked into an investigation and protested that they were being unjustly dealt with, and they admitted that the cost at the holder was something around 45 cents.

Mr. **Mathewson**: I do not think they ever admitted that, and I think that the professor is stating something about which he knows nothing, and that the computation is entirely wrong.

The **Master**: But all this evidence is open to the objection that I pointed out before, that it raises a vast number of collateral issues, some of which it may not be practicable to meet.

Mr. **Burr**: I can have the accountant here who made this examination and whose result it was, if we are going into it. I only wanted to get the fact that the cost of gas in Chicago was so much.

Mr. **Mathewson**: But it is not the fact.

Mr. **Burr**: Now, if we can show that the conditions are not the same, it will have very lit-le value.

The **Master**: Produce your report and let us see what it is.

(Book produced.)

Mr. **Burr**: That is from the report of the accountants to the Board of Counsel there.

The **Master**: Do you want to offer this report?

Mr. **Burr**: Yes.

The **Master**: Then it seems to be hearsay 3 degrees removed. The Doctor here is testifying about something of information he gets from a chairman of a committee in Chicago who bases his report on the report of a firm of New York accountants. Is that very valuable?

Mr. **Burr**: And the official report published by the City.

2329 The **Master**: Is not that Marwick & Company in New York?

Mr. **Burr**: Yes.

The **Master**: I should think if you want to prove anything about the cost of Chicago gas you had better call Mr. Marwick.

Mr. **Mathewson**: I call the Master's attention to the fact, too, that he is selecting one item out of this. Following that is Prof. Bemis, who was trying to make the cost appear as low as possible, 51.91 cents, virtually 52 cents, and not 45 cents, and following that is another one from Mr. Cawdrey of Laclede, who figures 53.52, and we are dosed here with 45.45 cents, when their own expert says it was 52 cents, Bemis, who I suppose is retained here to testify in this case.

By Mr. **Burr**:

Q. I call your attention to this report of the committee on Gas, Oil & Electric Light for the City Council of Chicago, January 28, 1906, page 40, Exhibit A. Will you be good enough to state from looking at that what the cost of gas was at the holder?

Mr. **Mathewson**: Objected to as immaterial and irrelevant and the witness is incompetent to testify on the point.

The **Master**: I will take it for what it is worth, as I stated. I do not regard it as of very great value, but I will take it. I assume that the witness having testified here on the facts in this case as to his opinion regarding what ought to be the cost of gas, that he ought to be allowed to get out here any facts that have influenced him in forming that opinion, and if this report about the cost in 2330 Chicago has any bearing on it, I think it is quite proper he should put it in. On that theory I will take it.

Mr. **Mathewson**: Exception.

A. From the report of the committee on Gas, Oil and Electric Light to the City Council of Chicago, January 29, 1906, I obtained the following figures of the revised cost by accountants who have made an investigation of gas of 22 candle-power. Cost of manufacturing in the holder, 28.22 cents per thousand c. f., cost of distribution including renewals at the consumer's meter 17.23 cents per M. c. f. Total cost 45.45 cents per M. c. f.

Q. Now, Doctor, if you for the purpose of computation take the apparent cost of gas to the Consolidated Gas Company at 53.50 cents and with the price of gas is fixed at seventy-five cents, what do you find remains of profits on each thousand cubic feet?

A. There remains a profit on each thousand cubic feet of gas sold of 21 and one-half cents.

Q. During the year 1905?

A. During the year 1905.

Q. If instead of the price of seventy-five cents for the city, you fix the selling price at eighty cents, what do you find there remains of profit on each thousand cubic feet of gas sold at the consumer's meters?

A. There remains 26½ cents for every M. c. f. of gas sold at the consumers' meters.

Q. By what method would you be able to arrive at the percentage of this profit on the actual structural cost of the gas works?

A. By finding out the actual structural cost of the gas works per M. c. f. made in each year and then finding out by the ordinary methods of computation what the percentage of profit would be on the actual structrual cost of each M. c. f. delivered.

Q. Now adopting that method what do you find the ap- 2331 parent fact to be regarding the Consolidated Gas Company and its plants?

A. From previous investigations or investigations in other companies——

Mr. **Mathewson**: I object to that unless the witness is shown to have some competency to judge as what the cost or value of the property here is. He certainly has not been shown yet to have any information on that score.

The **Master**: Let him finish his answer.

Mr. **Mathewson**: If he finishes his answer it will be up to me to move to strike it out and his answer is there. May I ask him two questions before he answer that question, as to his competency?

The Master: Certainly.

Mr. Burr: All right, I have no objection.

By Mr. Mathewson:

Q. Have you made a personal examination of the plants of the Consolidated Gas Company, Doctor?

A. As previously stated, I have been denied the opportunity.

Q. Have you seen any of the vouchers or any of the records as to the original cost of these lamps?

A. As I have previously stated, I have been denied the opportunity.

Q. Did you construct any of them?

A. I have not.

Mr. Mathewson: I object to this testimony as incompetent and the witness is not qualified to state what the cost of these plants is or was.

The Master: I will let him answer it and overrule the objection.

Mr. Mathewson: Exception.

A. I have been inclined to place the actual structural cost 2332 of the Consolidated Gas Company's station at $2.00, but a more minute and careful examination of the original reports of Jay Yeldon, accountant for the Commissions of 1885 and 1886, proves that the original and actual structural cost, when we take into consideration subsequent additions, is in the neighborhood of $1.91 per annual thousand cubic feet of gas sold. Thus, calling it $2.00, would for 75c. gas give a profit of 10¾ per cent. or over, and for 80c. gas a profit of 13½ per cent. or over, on the actual structural cost.

Mr. Mathewson: I move to strike it out on the ground it appears by the witness' answer that he bases it on the statement or report of Jay Yeldon, which is not in evidence here and of the accuracy of which there is no evidence presented.

The Master: I will let it stand.

Mr. Mathewson: Exception.

Mr. Burr: It is the basis of the report which you have offered in evidence.

Mr. Mathewson: The record shows differently.

By Mr. Burr:

Q. Have you examined Complainant's Exhibit 96?

A. I have.

Q. And from an examination of that and the testimony given in this case by the complainant what have you to say as to the total cash profits to the Consolidated Gas Company?

A. From Complainant's Exhibit 96, 1905, we have the following: Gas Sales, $13,552,482.97; operating expenses including taxes, $8,964,486.98; net earnings, $4,986,995.99. If we deduct arbitrary charges added to the cost of gas as a reserve, we have been 2333 given the following figures for the cost of gas per thousand cubic feet of gas sold.

By Mr. Addicks, 69.36 cents less reserve 3 cents, difference 66.36

cents. By Mr. Humphreys, 70.95 cents less reserve 5 cents, 65.95. Average of these two, 66.15 cents and if we further multiply this average of 66.15 cents by 13,283,164,000 cubic feet, we obtain $8,786,812.97, which is somewhat less than the operating expenses given in Exhibit 96.

From the figures of Messrs. Humphreys and Addicks it would appear as if

Gas Sales	$13,552,482.97
Less Operating Expenses, inc. taxes	8,786,812.97

would give net earnings of $4,765,670. This amount approximately corroborates the figures taken from the company's books.

Q. That is as they appear upon the statement in evidence?

A. Yes. It would be of interest to compare this net earning with the probable net earning, resulting in 1907 from a reduction of the price of gas to 75 cents to the city and to 80 cents to private consumers. We have from Mr. Addicks' affidavit, the statement that about four hundred million cubic feet annually are sold to the city authorities of the Borough of Manhattan by the Consolidated Gas Company, so that the 5 cents reduction to the city makes a negligible difference of about twenty thousand dollars, in this very large total.

Referring to the discussion of the probable sales of gas in 1907 it would seem as if it was probable that the total amount sold at 80 cents by the Consolidated Gas Company would be 15,342,981,000 cubic feet, and referring to the figures deduced for the cash cost of gas per thousand cubic feet sold of apparently fifty-three and a half cents we have the following:

2334 Gas Sales, 15,343,000,000 c. f. at 80c	$12,274,400.00
Apparent operating exp	8,208,505.00
Net Earnings	4,065,895.00

If, however, it should prove after a thorough investigation of the books, accounts, vouchers and works of the Consolidatedd Gas Company that the true cash cost of gas delivered at the consumer's meter is, as in Chicago, 45.50 cents or less, we would have

15,343,000,000 at 80 cents	$1,227,440.00
to add to the preceding	4,065,895.00
Making	5,293,335.00

cash profit on the sales of gas during the year 1907.

Q. What have you to say, doctor, as to the duty of a gas engineer with regard to the procurement of materials at fair prices.

Mr. MATHEWSON: I object to that as immaterial what the doctor has to say on that point. We concede that he ought to get them as low as he can.

Mr. BURR: He has given testimony as to the consumption of an unnecessary amount of oil in the additional candle-power which was not required by law. Now he as an old experienced gas engineer——

The MASTER: Don't you think I am capable of drawing that deduction?

Mr. **Burr**: No doubt about that, but I wanted to get what he had to say on the subject.

The **Master**: I know, but he might have a great deal to say that wasn't evidence.

Q. Now what do you conclude from the statements you have made will be the result with the price of gas fixed at 75 cents to
2335 the city and at 80 cents to private consumers, assuming that your prognostication as to population and consumption proves to be true?

Mr. **Mathewson**: What way?

Mr. **Burr**: Result to the Consolidated Gas Company in the way of profits.

Mr. **Mathewson**: Hasn't he already testified what he thinks there will be?

Mr. **Burr**: On the structural cost.

Mr. **Mathewson**: He has not testified what the structural cost was.

Mr. **Burr**: Per annual thousand feet of gas.

The **Witness**: I have made the annual structural cost at $1.91 previously, and suggested $2.00 as being in a rude way a sufficient factor of computation of the profit, or in the neighborhood of 10 per cent. or over in one case and in the neighborhood of 13 per cent. or over in the case of 80-cent gas——

Q. Thirteen or seventeen per cent.?

A. Thirteen per cent. in the case of the figure $2.00 being taken.

Mr. Burr will you pardon me, my eyes are beginning to hurt me, and if you can kindly suspend now——

Q. Just one moment. Referring to Exhibit 81, if you please Doctor, investment in gas business October 31, 1905, $40,500,455.99, did you examine that exhibit and what have you to say with regard to it and to its relation to what you have previously testified regarding this structural cost and the price of 75c. to the city and 80c. to the consumer?

A. It would appear that net earnings or profit for the sales of gas in 1907 would be about five million dollars on an actual structural cost of something less than thirty million dollars, or referring to Exhibit 81 investment in gas business October 31, 1905, $40,500,454.99 claimed structural cost, or of $49,110,454.99 tangible
2336 investments claimed as required in the gas business actively, this five million dollars would show a percentage ranging all the way from 17 per cent. or over in the first case to about 10 per cent. in the last case.

Mr. **Burr**: With your permission we will conclude to-day.

Adjourned to October 2, 1906, at 11 a. m.

2337 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *October* 2, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

MR. BURR: The statement of which the total figures were given on page 2320 was omitted from yesterday's proceedings and is now inserted here.

2338 SEGREGATION OF EXHIBIT 94.

				Cost per M sold.	
	Net coal, including coke, oil and spirit:				
Item	1, Bituminous coal	$729,606.21		7.00

2340 WILLIAM D. MARKS resumed.

Direct examination continued by Mr. BURR:

Q. Doctor, was the method which you adopted to ascertain the true cost of gas from the figures in evidence here based on Field's Analysis?

A. It was.

Q. What is Fields' Analysis?

A. Fields' Analysis is a compendium of the results published yearly in England giving the cost of gas made in the various gas works throughout England, in conventional form.

Q. Is it a standard form?

A. A standard form, and is used for comparing the results of the various gas works throughout England, Ireland and Scotland.

Q. Have you Field's Analysis of the accounts of the gas companies in England, Ireland and Scotland for the year 1905?

A. I have. It is in your hands.

Q. And was your analysis of the accounts of the Consolidated Gas Company based upon that method pursued in the Fields' Analysis?

A. It was.

Mr. **Burr**: I offer in it evidence.

Mr. **Mathewson**: I object to that book going in evidence. I do not see how it is material or relevant. He stated he followed the methods there, and if we find he did not——

Mr. **Burr**: It is a standard method.

The **Master**: He testifies it is a standard and proper method, and unless it is contradicted it stands, and it is not necessary to put the book in evidence.

Mr. **Burr**: I will not burden the record with that book, if that is the understanding.

The **Master**: Well, I would not take it.

2341 Q. Have you made an investigation of the actual structural cost of the stations of the Consolidated Gas Company?

A. So far as it has been permitted, I have made approximate estimates based upon comparisons with the actual structural cost of gas works in Massachusetts and upon their outputs and capacities.

Q. As you have testified, it is impossible without an inventory going into detail and involving a personal examination to give the actual structural cost?

A. In individual instances it cannot be given with great precision without a personal examination and a careful inventory.

Q. But are there, as the result of experience and to your knowledge, certain precedents and constants of construction and of capacity of gas works which are recognized among engineers as sufficiently approximate to afford a safe estimate of the actual structural cost of proposed or existing gas works?

A. There are, and they have been used in this investigation.

Q. And is it customary to use these constants of costs and capacity for the purpose of checking precise inventories of gas works?

A. In order to avoid the possibility——

Q. Well, is it?

A. It is.

Q. You may continue about that.

A. In order to avoid the possibility of large errors or to check unusual constructions, a competent engineer would not regard an inventory as complete unless it had been carefully checked from precedents already in existence and of a somewhat similar character, if such a thing were possible.

Mr. **Burr**: I offer in evidence Mr. Yalden's report attached to the report of the Senate Committee of Investigation of Lighting Companies in the City of New York, March 1st, 1886. 2342

Mr. **Mathewson**: Senate Document 47?

Mr. **Burr**: Senate Document 47.

Mr. **Mathewson**: I object on the same grounds that I objected to the offering of page 776, which was part of Mr. Yalden's report; that it is incompetent, and, furthermore, that it is immaterial, in view of the terms of the statute under which the complaint was formed.

The **Master**: I will take it.

Exception.

Received in evidence and marked City's Exhibit 48.

Mr. **Burr**: I meant the report and the tables attached to City's Exhibit 48 of October 2nd, 1906, embracing from page 635 to and including page 781.

The **Master**: Exactly what is that? Is it an accountant's report attached as a schedule to a report of a Senate Committee?

Mr. **Burr**: Yes.

Mr. **Mathewson**: That includes City's Exhibit 31, already offered on page 776 of this Exhibit 48 to-day.

Q. Now, you have familiarized yourself, Doctor, have you not, with the consolidation of the companies in November, 1884?

A. I have. I have made a very careful study of the records and reports upon that consolidation.

By Mr. **Mathewson**:

Q. Won't you specify what records and reports?

A. The report, Senate Document of 1885, and also Senate Document 47 of 1886.

2343 By Mr. **Burr**:

Q. What did you find was the method of consolidation adopted by the six companies in 1884?

Mr. **Mathewson**: Objected to, the witness being incompetent to state. It is already fully in evidence, covering the method pursued.

Mr. **Burr**: Well, he is going to base—— It won't take more than ten lines.

The **Master**: But it is all in evidence as to how it was done.

Q. In 1884, is it not a fact that the six companies which had been operating under the pooling agreement fixing the price of gas to the inhabitants of the Borough of Manhattan, consolidated as one company under the statute of 1884?

Mr. **Mathewson**: Objected to as improper in form, and the witness is incompetent to answer. There has been no testimony about a pooling arrangement. I do not suppose Professor Marks was connected with the companies or has any knowledge on that point. It is in evidence six companies consolidated.

The **Master**: If it does not appear here already in evidence it must be susceptible of better proof than this, Mr. Burr. I will sustain that objection.

Mr. **Burr**: I offer in evidence pages 782 and 783 of Senate Document No. 47, being the pooling agreement and apportionment tables attached to the report of the Senate Committee.

Mr. **Mathewson**: Objected to as incompetent, irrelevant and immaterial. I cannot see how it affects the issues in this case at all. It does not make their property more or less valuable.

2344 The MASTER: I will take it.
Exception.

Received in evidence and marked City's Exhibit 49.

Q. Is it not a fact, or is it the fact, that by reason of the consolidation that the actual and true structural cost of the companies was hidden through the capitalization which resulted from the consolidation of the companies?

Objected to as purely a conclusion and as something which, if it is of any value at all, should be drawn by the Referee or Court and not by this witness; furthermore, that the witness is incompetent.

Mr. BURR: Well, the Referee can learn it in two words here and we can go on with the testimony without pausing here to——

The MASTER: Do you not think we had better get in the facts on which that conclusion is based? I might possibly draw the same conclusion as the witness. The witness might think something was concealed and say so, and somebody else looking at the facts might not think that something was concealed and say so.

Mr. BURR: I want to get the facts on which he bases the conclusion, if that is his conclusion.

The MASTER: Your question rather called for a conclusion.

Mr. BURR: Because I thought he objected to giving the facts.

Mr. MATHEWSON: Your facts are admitted, so far as you have offered them.

The MASTER: You can show, and I think it has already been shown, what the capitalization was of all those constituent
2345 companies and what the capitalization of the new company was, and you can produce the figures if you like of the structural value of the plants and then it would be open to the Court to draw a conclusion based on those facts, as to whether there was any concealment or shuffling around of capitalization.

Q. You have examined the report of the Committee of 1886 and you have also examined the report of the accountant employed by that Committee, Mr. Yalden?

A. I have.

Q. And you are familiar with the facts and figures brought out by Mr. Yalden in his report and his schedules annexed to his reports?

A. I am.

Q. And as a result of the examination of Mr. Yalden's account, which is now in evidence here, what do you find was the situation in 1884 when this consolidation took place, as to whether there was anything sold by the constituent companies to the Consolidated, or whether it was merely an aggregation of these companies coming together and changing their name to the Consolidated Gas Company?

Mr. MATHEWSON: I object to that, on several grounds. In the first place, he has asked what these reports show. The reports show what they show. His testimony cannot make it any more or less emphatic. In the second place, the testimony sought is purely a conclusion, and you might call a witness to say that some other conclusion was correct, neither one of which would be of any value as against the language of the documents themselves. It seems to me we are going very far afield and opening a wide field if we are going into these things—conclusions of witnesses.

The **Master**: It seems to me there is considerable force in that, Mr. Burr.

2346 Mr. **Burr**: I simply desired to show now by this witness what I think will not be denied by Mr. Mathewson or by anybody, that these companies simply changed their name, that is all, by adopting a partnership name called the Consolidated Gas Company.

The **Master**: Isn't that a matter for you to argue if you choose in your brief at the proper time from these facts now in evidence? How does it add any strength to it to have one witness or another say what he admits to be shown by those figures?

Mr. **Burr**: I am simply trying to have him tell you what he finds existed at the time with regard to the structural value, and in the absence of such an investigation as he has been able to have had he can deduce from that——

The **Master**: He can comment on these facts in this report in evidence from which conclusions such as you want might be drawn possibly, but beyond that I do not think he ought to go. Your question is pretty broad.

Mr. **Mathewson**: We consolidated under the statute of 1884 expressly authorizing such consolidation of such companies, and whether the effect of the statute was to change the name of the company, or whether it formed a new corporation, it seems to me is not for this witness to say.

The **Master**: I will sustain the objection. I think the question is objectionable.

Mr. **Burr**: You may answer.

A. From my investigations, so far as the stockholders were concerned, nothing was sold and nothing was paid for in money. The stockholders of the six companies received in exchange for their stocks certificates in these companies, an average of about 2347 what was twice their face value in the stock of the Consolidated Gas Company.

Q. And was the capitalization increased?

A. The capital stock of the six companies was $17,000,000. It was increased in the Consolidated Company to $39,078,000.

Q. Was that from your opinion or investigation a fictitious capitalization?

Objected to.

Objection sustained.

Exception.

The **Master**: You can answer it.

A. It was a fictitious capitalization to a very large amount.

Q. And to that extent is it your opinion that the actual structural cost of the gas plants of the Consolidated Gas Company was concealed—the true structural cost?

Mr. Mathewson: I make the same objection, that it is a conclusion and as incompetent.

Objection sustained.

Exception.

A. The actual structural cost of the six companies was concealed by the opening of the new books of the Consolidated Gas Company with very large increased values to correspond with that increased capitalization.

Q. Have you sought to ascertain with some approximation the probable structural cost of the gas works of the Consolidated Gas Company?

A. I have.

Q. Will you state what methods you pursued in such endeavor?

Mr. Mathewson: I object on the ground that this witness
2348 has not been shown to possess knowledge or to be competent
to testify as an expert on the cost of gas plants.

The Master: He may state what method he pursued.

Exception.

A. I have been obliged to take the figures as to the output or gas sales of the Consolidated Gas Company and having those figures to endeavor to obtain the actual constructural cost by careful comparison with the carefully kept figures of Massachusetts Gas Companies and the relation which existed between their structural cost and their gas sales.

Q. And will you tell us the result of such investigation by you?

Mr. Mathewson: I make the same objection.

The Master: When you say the result, you mean what is the structural cost of those plants as arrived at by him by the application of this method?

Mr. Burr: Yes.

Objection overruled.

Exception.

A. In order to learn the sum approximately of the probable structural cost of gas works it would be necessary to refer to the report of the Massachusetts Gas and Electric Light Commissioners for the calendar year 1905. On page 26, Appendix, we find the statement of assets of the Cambridge Gaslight Company as follows:

Real Estate	$321,737.21
Machinery and Manufacturing Appliances	472,589.58
Street Mains	461,269.43
Meters	50,000.00
Works in Process	263,394.14
Total Structural Assets	$1,568,990.36

2349 On page 114 the daily capacity is shown to be 4,000,000,
c. f., making an average cost per thousand c. f. of daily capacity of $392.25. The gross output of these works December 24, 1905, was 2,125,000 c. f. The annual output of these works is

439,162,251 c. f., or dividing this by 365 gives an average daily sales of 1,203,184 c. f. The water gas used as ordinary coal gas, 140,300,000 c. f. for the year. The population supplied was 97,434 in 1905. It is customary to divide the structural cost of daily output by 200 to obtain the required structural cost of the annual thousand feet sold, which in this case is $1.96.

Referring to the Fall River Gas Works, page 51 appendix of same report, we have:

Real Estate	$215,006.46
Machinery and Manufacturing Appliances	385,952.43
Street Mains	337,789.86
Meters	58,704.83
Office Furniture	2,648.18
Total Structural Assets	$1,000,101.76

By Mr. MATHEWSON:

Q. Is that the total structural assets or cost?
A. Yes.
Q. Which?
A. Both.
Q. Which is carried out in the report?
A. As assets.

The daily capacity of works is 2,500,000 c. f., making an average cost of a thousand c. f. of daily capacity $400. The gross output of these works December 24, 1905, was 1,509,000 c. f. The annual output of these works is 321,119,341 c. f., or dividing by 365 gives us a daily average sale of 879,779 c. f. No coal gas was used. The total manufactured being water gas. The population supplied
2350 was 105,762 in 1905. The structural costs required per annual thousand feet is $2.00.

Referring to the Lowell Gas Works, Page 80, Appendix of same Report, we have:

Real Estate	$804,741.08
Machinery and Manufacturing Appliances, Street Mains and Meters	620,619.12
Total Structural Assets	$1,425,360.20

The daily capacity of works is 4,400,000 c. f., making the cost per thousand c. f. of daily capacity of $323.95. The gross output of these works December 28, 1905, was 2,234,000 c. f. The annual output of these works was 482,088,600 c. f. Dividing this by 365 gives a daily average sale of 1,320,791 c. f. Of the gas made 235,271 c. f. was low carbureted water gas and the remainder was coal gas. The population supplied was 94,889 in 1905. The required structural cost per annual thousand c. f. is $1.62.

By Mr. MATHEWSON:

Q. Per thousand cubic feet of what? I don't understand.
A. Annual sales.

Q. Per thousand cubic feet of annual sales?

A. Yes.

Q. Not of capacity?

A. Of capacity. I beg your pardon.

Referring to the Worcester Gas Works, page 151, Appendix of same report, we have:

Real Estate	$536,477.34
Machinery and Manufacturing Appliances	626,399.51
Street Mains	114,278.44
Meters	19,415.75
Total Structural Assets	$1,296,571.04

2351 The daily capacity of works is 4,200,000 c. f., making an average cost per thousand cubic feet of daily capacity of $308.69. The gross output of these works December 24, 1905, was 20,196,000 c. f. The annual output of these works was 410,641,700 c. f., or dividing by 365, gives a daily average sales of 1,125,046 c. f. Of the gas made 226,400,000 c. f. were low carburated water gas. The remainder was coal gas. The population supplied was 128,136 in 1905. The structural cost per annual thousand cubic feet capacity is $1.54.

It is of interest to note on page 117 of the Mass. report of 1905 that the total sales of coal gas in the State of Mass. for 1905 was 10,410,347,847 c. f. as against 13,283,163,767 c. f., in the island of Manhattan sold by the Consolidated Gas Company.

Tabulating these results we have:

Name of city.	Population served in 1905.	Total annual gas sales, c. f.	Structural assets.	Daily capacity, c. f.
Cambridge	97,434	439,162,251	$1,568,990.36	4,000,000
Fall River	105,762	321,119,341	1,000,101.76	2,500,000
Lowell	94,889	482,088,600	1,425,360.20	4,400,000
Worcester	128,135	410,641,700	1,296,571.04	4,200,000
Totals	426,220	1,653,011,392	$5,291,023.36	15,100,000
Average	106,555	413,262,973	$1,322,755.84	3,775,000

Cost per M daily capacity.	Greatest output, c. f.	Average daily sales, c. f.	Structural cost annual M. Divisor 200.	Structural cost annual M sales. Divisor 111.3.
$392.25	2,125,000	1,203,184	$1.96	
400.00	1,509,000	879,779	2.00	$5,291,023.36
323.95	2,234,000	1,320,791	1.62	1,653,012 M.
308.69	2,019,000	1,125,046	1.54	
$1,424.89	7,887,000	4,528,800	$7.12	
$356.22	1,971,750	1,132,200	$1.78	$3.20

2352 By Mr. Mathewson:

Q. If you will permit me to ask, do I understand by this that the assets represent $3.20 for each thousand of annual sales?

A. Structural assets, yes.

Q. And your average is obtained by dividing by four in each case, the total?

A. Yes.

By Mr. Burr:

Q. By using the divisor 200, what do you obtain?

A. In the above calculation, by using the divisor 200 we obtain $1.78 structural cost for annual thousand c. f. capacity, and using the actual sales we obtain $3.20 structural cost per M annual c. f. of sales, the divisor being 111.3. It is obvious if these works were run to their full capacity under the ordinary method of engineering that the structural cost obtained by a competent engineer would be $1.78, and also that the cause of the abundance of precaution used in establishing these works that a useless expenditure has been made of $1.42 per annual M c. f. of capacity. It will be observed that the greatest daily output, 7,887,000 c. f., is 1.74 times the average daily sales of 4,528,800. Further it will be observed that if we divide the daily capacity 15,100,000 c. f. by the greatest output, 7,887,000 c. f., we obtain 1.91, showing that the promoters of these works had over-estimated the greatest output of these works by 91 per cent. for 1905. Possibly they have intended to build their works so as to provide for the growth of population and the sales of gas for many years after 1905.

Q. Applying the result of your investigation into these companies to Exhibit 94, in this case what do you find?

A. Referring to Exhibit 94 we find gas sold and also made at the Consolidated Gas Company's stations 10,419,461,000 c. f.
2353 Referring to Chief Engineer Bradley's first affidavit, page 35, we find that he gives the capacity of the Consolidated Gas Company's plants at 51,000,000 c. f. per day. If we divide the first figure by the last we obtain a factor of capacity of 204, which proves that the present stations of the Consolidated Gas Company are run slightly beyond their average of standard capacity, as reckoned by Chief Engineer Bradley with a capacity factor of 200. This 200 has been used in the case of the Massachusetts Gas Companies and, therefore, the actual structural cost per annual thousand sold should be in the neighborhood or less than 1.78 for the existing works of the Consolidated Gas Company. If we multiply 10,419,461,000 by $1.78 we obtain $18,546,640.58 as the true and approximate structural cost of the Consolidated Gas Company's existing stations. Referring now to the gas made by other companies and sold by the Consolidated Gas Company, Exhibit 94, 2,863,702,000 c. f. and multiplying this by $1.78, we obtain $5,097,389.56, which is an amount justifiably invested in other stations and in the mains, service pipes and meters for distribution. Adding these two together, we obtain Consolidated Gas Company's Stations, $18,546,640.58.

Other investments in stations....................	$5,097,389.56
Or a total of....................................	23,644,030.14

This is the fixed or structural investment which can approximately be claimed on the basis of the Mass. State's precedents for fixed or structural cost of the main and subsidiary plants controlled or acquired by the Consolidated Gas Company, which is to-day using a capacity factor of 204 which is slightly in excess of the standard capacity of 200. It is obvious that the above reasoning is based on the fact that if the plants of the Mass. Gas Company had been employed to their full annual capacity as is at present the 2354 case of the Consolidated Gas Company the proper actual structural cost would be $1.78 per annual M and the cost of the entire works required by the Consolidated Gas Company, from real estate through all details to meters, would be about $23,644,030.14.

Q. Now in addition to the fixed or structural assets of a company is a certain amount of capital required for operating the works?

A. There is.

Q. And does that bear a certain relation to the annual sales of gas?

A. It has been stated to bear a certain relation to the annual sales of gas and it will therefore be necessary to learn from these Massachusetts companies the amount of capital per annual M. furnished by the stockholders and the amount ordinarily borrowed on short term notes or furnished in the form of consumers' deposits or unpaid bills.

Referring to Massachusetts Gas and Electric Light Commission's report for the calendar year 1905, we find the total assets of the four Massachusetts companies as follows:

Cambridge Gas Company	$1,742,581.88
Fall River Gas Company	1,228,760.41
Lowell Gas Company	1,732,486.24
Worcester Gas Company	1,439,444.77
Total	$6,143,273.30
Substracting fixed or structural assets	5,291,026.36
We have a Working Capital of	$852,246.94

Part of this Working Capital is obtained in the form of Consumers' Deposits, and part on short term notes and unpaid bills, as follows:

2355 Cambridge Gas Company—Consumers' Deposits	$11,415.00	
Cambridge Gas Company—Notes Payable	225,000.00	
		$236,415.00
Fall River Gas Company—Consumers' Deposits	$429.85*	
Fall River Gas Company—Unpaid Bills	13,580.92	
Fall River Gas Company—Notes Payable	180,000.00	
		194,010.77

---

* See correction on page 2562 $2,193 and Consumers' Deposits changed to "Interest accrued but not due."

Lowell Gas Company—Consumers' Deposits	$2,832.51	
Lowell Gas Company—Notes Payable	75,000.00	
Lowell Gas Company—Unpaid Bills	8,670.38	
		$86,502.89
Worcester Gas Company—Consumers' Deposits	$25,237.00	
Worcester Gas Company—Notes Payable	95,000.00	
		120,237.00
		$637,165.66

If we subtract the total of these floating liabilities, $637,165.66 from Working Capital, $852,249.94, we obtain $215,084.28, being the active capital furnished by the stockholders for the ordinary needs of the gas business. If we divide this amount by the total annual sales of 1,653,012,000 c. f. we obtain $0.13 per annual M. sold as the amount of capital actually and practically necessary on the part of these Massachusetts companies. If we multiply 2356 13,283,164,000 c. f. in Exhibit 94 by this, we obtain the proper allotment of active capital furnished by the stockholders of the Consolidated Gas Company from Massachusetts precedents, which is $1,726,811.32. These figures would appear to prove that the required and practical investment of the Consolidated Gas Company, provided it had built its gas works with the skill and prudence of Massachusetts engineers and managed its working capital by methods actually in existence in Massachusetts to-day would be as follows:

Fixed or Structural Assets	$23,644,030.14
Active Capital Furnished, or Quick Assets	1,726,811.32
Total Required	$25,370,841.46

Q. How close does that corroborate your former statement?

A. This figure closely corroborates my statement in my first affidavit, page 41, cost of property, $25,000,000. That is quite as closely as could be expected. Or the same affidavit, page 57, the entire cost of plants, $26,600,000. It would appear from the results obtained in Massachusetts as also from the deductions of the three commissions which have already——

Mr. Mathewson: Now——

Q. Never mind, leave that out. Now, do these four Massachusetts companies form a group resembling in any manner the group of Consolidated Gas Company's stations in the Island of Manhattan?

A. These four companies were selected because they formed a group resembling very closely the five stations in the Island of Manhattan, differing, however, in the fact that they were not driven to their utmost capacity, as Chief Engineer Bradley states. May I ask, Mr. Burr, in connection with the figure which I have just 2357 referred to of $25,370,841.46, that in referring to my other figures of $25,000,000 and of $26,600,000 that I did it for the purpose of stating frankly that in averages of this sort it is necessary to allow a *liability** one way or another which sometimes may reach five, six and even ten per cent. above or below under conditions of this sort, and that my object in mentioning the $25,000,000 and the $26,600,000 in addition to this figure was to state clearly in advance that such variations and percentages are acknowledged as being right and often used by engineers.

Q. Now the Massachusetts stations have smaller sales of gas, have they not?

A. They have smaller sales of gas than the New York Companies, but they are engaged, as is the Consolidated Gas Company, in making ordinary coal gas and low carbureted water gas, requiring for this purpose like apparatus. Their actual structural cost per annual M. c. f. of capacity or of sales of gas, referring to the Massachusetts companies, will somewhat exceed the structural cost of the New York companies, even though driven to the same limit as are the Manhattan stations. Particularly in the matter of mains for gas distribution is the Consolidated Gas Company of New York favored by conditions and the cost of these mains of large diameter and delivering vast quantities of gas per annual thousand feet of sales should be very much less per M. c. f. than is the case in the Massachusetts gas companies. In the matter of the original cost of the real estate and apparatus, I mean the first cost of the real estate, the money that was paid for it by the original six companies, there would appear to be very little difference indeed.

Q. With the exception of the holders?

2358 A. With the exception of the holders. In the matter of the holders, the rapid decrease in cost of holders per thousand cubic feet of capacity as their size has increased, gives the New York companies very decided advantages over the Massachusetts companies. We are justified in inferring, therefore, that in deducing the correct cost approximately of the Consolidated Gas Company's and subsidiary companies' investments, that we have not underestimated the investment required in New York City for actual structural cost.

Mr. **Burr**: May we suspend now and reassemble at two o'clock?

Recess until Two P. M.

After Recess.

William D. Marks resumes the stand.

Direct examination (continued):

By Mr. **Burr**:

Q. Doctor, have you finished as to the structural cost?

A. Before ending up with the structural cost based upon the Massachusetts estimate, I would like to say that my estimate of $25,370,000 and my estimate of $26,600,000 are estimates, and making all possible allowances for differences in the locality and also for the difference between the gas made and the gas sold, I am positively of the opinion that the actual structural cost of the works of the Consolidated Gas Company is less than the twenty-nine to thirty millions fixed by the Gas and Electricity Commission of New York State.

---

*Variation; see correction on page 2561.

2359 Q. Now, we will take up the real estate account so far as it has been presented here. Have you made an examination of the statements and have you heard the testimony or read the testimony which has been given here with regard to the real estate of the Consolidated Gas Company?

A. I have.

Q. Will you state what conclusion you came to from such examination as to the value of the real estate.

Mr. **Mathewson**: I object to this, Mr. Master. The witness clearly has not been qualified as a real estate expert, he is incompetent to testify, not qualified to give an opinion.

The **Master**: The question seems a little bit wide open, Mr. Burr, does it not?

Mr. **Burr**: He is not testifying as a real estate expert, but he is testifying as to what, by a proper arrangement of the accounts that have been presented here, in his opinion as a gas expert, fully familiar with the works and the operation of the company and the testimony that has been given, the real cost still continues to be of the real estate.

The **Master**: If you want to show by him that any part of that real estate is not desirably situated or not advantageously situated for the purposes of use in a gas plant, or that it is wastefully employed or anything of that kind, why that is right enough; you can ask him that; but to ask him if he has heard the testimony of the real estate experts as to the value of this property and ask him what conclusion he came to, without showing that he has any knowledge of real estate values, that is going pretty far.

2360 Mr. **Burr**: I am not asking him to testify to the value of the real estate, but I am asking him whether he has examined the real estate account as presented here.

The **Master**: There is nothing to show here that his conclusion is of any importance on the subject one way or the other. That is the difficulty with your question.

Mr. **Burr**: There are certain exhibits here which he has studied and he has arrived at certain conclusions from those exhibits. Now I think he is entitled to express the conclusion he has arrived at from the study of those exhibits.

The **Master**: Not unless you point out in what respect his conclusion is material or relevant.

Q. State's Exhibit S., page 728 C., give the real estate as $10,929,918.28. I call your attention, doctor, in that connection to the exhibit——

A. I have it. Balance sheet December 31, 1905.

Q. What is the real estate given there as?

A. Real estate $10,879,329.63; real estate M. $50,588.65. Total $10,929,918.28.

Q. Now, referring to that, I call your attention to City's Exhibit 48, Senate Document 47, 1886, page 779. What do you find to be the valuation given by Mr. Yalden, the accountant, of the real estate on the books of the Consolidated Gas Company?

Mr. **Mathewson**: I think I shall have to object. I do not see that it makes any difference what the witness finds in that exhibit to be stated. It obviously cannot be followed up by any testimony of the witness as to the valuations, and whatever appears does appear.

Mr. **Burr**: Well he is going to arrive at a conclusion and I think I am entitled to have spread on the record just what methods 2361 he has resorted to to arrive at his conclusion. His statement appearing offered here that such a value is placed upon the real estate for the year 1905 he takes the valuation of the same real estate that is fixed in 1884. Naturally it may have increased or it may have diminished. Now he reasons from that to a certain other conclusion and he reasons from the fact that part of that real estate that was originally the property of the Consolidated Gas Company appraised by Mr. Yalden at a certain figure has been taken by the City and paid for, which would naturally leave a certain other figure as the real estate remaining, and upon that he arrives at his conclusion as to what effect that has upon the price of the production of gas and the propriety of the charge made by the Consolidated Gas Company based upon the value of their real estate as given here.

The **Master**: What I do not understand is why that all is not a matter of argument and a matter of brief making. Why is it necessary to call a witness and put him on the stand and ask him what he thinks about it? You have got the facts here. You have got the Yalden report here. If the point is one in which the peculiar knowledge and experience of the witness as an expert in the gas business comes into question that is one thing. Then I think you are probably quite right.

Mr. **Burr**: I want to ask as to the structural value of this real estate and that is in line with his previous testimony.

The **Master**: I am not disposed to limit you at all, and I do not want to encourage any making of technical objections, although some of these questions are very objectionable, no doubt, as 2362 far as the point of view of the laws of evidence is concerned. I do not want to cut you off, but at the same time it seems to me that this is getting a little beyond the ordinary line. I am perfectly willing and I think it is right that you should bring out here whatever you want to [illegible] the way of showing Dr. Marks' criticisms from the standpoint of a gas expert on the methods according to which the other side have made up their estimates of cost. Now if you can point out by some question here what the point is that you want to bring out here regarding these real estate values so as to bring it within that rule, I do not think there would be any objection. If so, I should overrule it.

Mr. Burr: I will ask the one question and then leave it to them to cross-examine.

Q. From your examination of the real estate accounts or data, so far as they have been presented or supplied by the Consolidated Gas Company, what do you find to be the approximate constructural cost of the real estate remaining in use by the Consolidated Gas Company?

Mr. **Mathewson**: Objected to, for the same reasons. He confessedly is proceeding upon an exhibit which has been offered in evidence and which states whatever it does state, and the witness is not shown to be qualified to draw any conclusions as to the value himself.

The **Master**: It is apparent from that question that it must argue out some sort of theory based on these facts. I will let him answer it.

Mr. **Mathewson**: Exception.

2363 A. I find by a careful examination of the transcript furnished by the Consolidated Gas Company, and also of the accounts of J. Yalden of the individual companies, that the actual structural cost of the real estate remaining in active use for the purpose of gas making of the Consolidated Gas Company amounts to approximately $3,068,140.51.

Mr. **Mathewson**: I move to strike that out, Mr. Master, as a statement of opinion by this witness upon a subject respecting which he is incompetent to testify, not qualified in any sense. We might as well put on any one of our officers who had more experience in the gas business than this witness to testify as to the value of real estate. I do not know where we will come out if we are going to do that.

The **Master**: I will let it stand.

Mr. **Mathewson**: Exception.

Mr. **Burr**: We have made demand for that account and our demand was not complied with. We are doing the best we can with the material you supplied.

Q. Is that after you have made allowances for the pieces of property which have been sold or condemned by the city or are in process of being condemned and taken by the city?

A. It is after making allowance of the property sold or abandoned by the Consolidated Gas Company.

Q. What do you find the total of such property to be?

A. About $1,985,874.34. In round figures two million dollars.

Q. Give the details of that amount or that total.

2364 A. Little Italy Park, 111th and 112th Street, Harlem	$365,000.00
Purchased by New Amsterdam Co., (Exhibit 48) ...	180,000.00
Condemned by City, Bulkheads 21st and 22nd Street.	247,858.00
Abandoned Because of Condemnation Proceedings by City, Bulkheads 16th, 17th and 18th Street......	317,100.00
Land, 18th St. Station, Parcel 4, Exhibit 48 and 49, Valuation, City Expert......................	875,916.37
Purchased by Standard Gas Light Co., Exhibit 48, Price Not Given..........................	
Total	$1,985,874.37

Q. That does not include the piece of property purchased by the Standard Gas Light Company, Exhibit 48, on which the price is not given?

A. It does not, nor does it include the piece of land purchased of John D. Crimmins.

Q. The total of real estate, bulkheads and office buildings as appearing in the account of Mr. Yalden on page 779 (1401 in Exhibits) of City's Exhibit 49, appears to be:

Real Estate	$8,617,000.00
Bulkhead Piers and Water Rights	1,390,000.00
Office Buildings	325,000.00
Total	$10,332,000.00

And at page 674 (1272 in Exhibits) the value of the same real estate belonging to the various companies consolidated appears to be given as follows:

2365 Page 674, Manhattan Gas Light Company	$930,872.45
Page 712, New York Gas Light Company. Exhibits P. 1334	1,957,000.00
Page 734, Metropolitan Gas Light Company. Exhibits P. 1356	1,445,779.79
Page 748, Municipal and Knickerbocker Companies. Exhibits P. 1360	561,462.83
Page 760, Harlem Gas Light Company	158,899.81
Total	$5,054,014.88

Do you deduct the total of the property condemned and sold, $1,985,874.37, from the $5,054,014.88?

A. I do.

Q. And you then obtain the $3,068,140.51, as appears?

A. I do.

Q. (Continuing:) In the account of Yalden to have been the original cost to these companies of such real estate?

A. As taken from the books of the original six companies.

Q. Now, will you take up plants, tanks and holders, foundations and damages as they are given on State's Exhibit 8?

A. It is given as $16,175,382.67.

Q. Referring again to City's Exhibit 48 of this date, I find on page 674 of Mr. Yalden's report:

Page 674, Manhattan Gas Light Co., Manufacturing, Building	$447,819.00
Page 674, Manhattan Gas Light Co., Apparatus	1,890,810.82
Total	$2,338,629.82
Page 712, New York Gas Light Co., Works and Apparatus	2,893,767.35
Page 734 (see page 847), Metropolitan Gas Light Co., Construction	2,608,195.64

Page 748, Municipal and Knickerbocker Co.'s Gas Works	$2,327,330.32
Page 750, Harlem Gas Light Co., Buildings in Construction	569,495.57
Total	$10,737,418.70

2366 Q. Now, referring to Complainant's Exhibit 89, page 371, what is the statement made in that exhibit as to the increase in the real estate, plant, property and construction since 1884?

A. Complainant's Exhibit 89, comparative condensed balance sheet, real estate, plant, property and construction, variations, meaning by that increase, $9,693,565.90.

Mr. MATHEWSON: Beginning from what time.

The WITNESS: From November 11th, 1884, to October 31st, 1905.

Q. And is the increase in the value of the real estate stated by the books, given?

A. The increase in the value of the real estate stated by the books——

Q. What books?

A. Of the Consolidated Gas Company is $597,918.28.

Q. Making a total of what amount?

A. Which leaves according to accounts $9,095,647.62 for additions exclusive of real estate applied upon plant, property and construction.

Q. Now, will you refer to Exhibit 81, at page 350?

A. Exhibit 81, October 31st, 1905—shall I give the figures?

Q. Yes.

A.—

Mains	$7,852,151.03
Services	1,212,071.09
Meters	3,802,544.50
Total	$12,866,766.62

Q. What do you find the same items appraised at in Exhibit 48 of the City?

Mr. MATHEWSON: They were not appraised.

Mr. BURR: Well, stated to be.

Mr. MATHEWSON: They were what they stood on the books of the original companies, according to the testimony.

2367 A. In Senate Document 47, page 652:

Mains	$5,217,000.00
Services	1,005,000.00
Meters	1,195,000.00
Total	$7,417,000.00

Q. A difference in the increase then claimed by the Consolidated Gas Company of $5,449,766.62?

A. This being the difference between those two totals.

Q. If you subtract that amount of $5,449,766.62 from the amount of $9,095,647.62 what do you obtain?

A. $3,645,881, and that is a residue which is claimed to have been applied upon the manufacturing plants and holders.

Q. Making a total of how much?

A. Making a total of $14,385,299.70 as against $16,175,382.67.

Q. For what?

A. For the value of the manufacturing plant and holders.

Q. Now I refer you to the testimony of Mr. Mayer as it appears at page 1381 regarding the value of the abandoned plant at 18th Street. It is stated by him to be $1,508,035.00. As you have stated it, it appears to be $569,495.57, as the value in 1884 of the abandoned plant, 112th Street, Harlem, of which the holder now remains?

A. That is correct.

Q. What do you find the total to be?

A. The total property abandoned, that is, out of active use, amounts to $2,077,530.57.

Mr. **Mathewson**: What kind of property?

The **Witness**: The abandoned plant at 18th Street and the abandoned plant at 112th Street, Harlem.

Q. Now, if you deduct that from the $14,385,299.70, what do you find to be the remainder?

2368 A. It leaves $12,307,769.13 for the value of the actually operating and going manufacturing plants and holders of the Consolidated Gas Company.

Q. Calling your attention to the testimony of Mr. Simpson regarding the mains, do you find any discrepancy between the number of miles in use and the amount previously stated as being operated by the Consolidated Gas Company?

A. It would also appear from the testimony of Mr. Simpson that instead of 822 miles of active mains there are 795 miles, a difference of 27 miles of mains, of sizes which have not been specified by him.

Q. Well, what have you to say with regard to that, the subject of mains?

(Witness produces chart.)

Q. You produce a chart, Doctor. Does that show the estimated cost of laying gas mains in 1905 of all sizes and descriptions as stated to be in use by the Consolidated Gas Company in that year?

A. It is the estimated cost of laying mains during the year 1905, and is the result of the accumulation of a very large amount of data at various times and finally putting it in the form of a chart which enables us to immediately learn the cost of any size of main under any pavement that is in ordinary use per lineal foot laid with the surface restored. It has been used and checked in a good many different ways by a good many different authorities.

Mr. **Mathewson**: Well, they are not here, the authorities are not here, except you, Professor.

Q. Well, will you explain a little further what this shows, more in detail?

A. For instance, beginning at the bottom the prices of 10 cents, 30 cents, 50 cents and 90 cents up to $1.00 are laid off in the first half and the prices from $1.00 on to $25.00 are laid off in
2369 the second half or right hand side; the sizes of the various mains placed under consideration, that is to say their diameter in inches, is laid off vertically beginning with the 2 inch and running through as far as a 60 inch diameter main. The method of using it is to select the size of main as for instance a 36 inch main and tracing the horizontal line from 36 inches across, find out the cost per lineal foot where it intersects the heavy lines or curves shown. As for instance, the cost per foot of straight pipe not laid of 40 inches diameter, is $6.48; the cost of the same pipe per foot in streets with macadam tops laid and restored is $9.65 and so on through.

Mr. Mathewson: What is the $9.65?

The Witness: Beginning at 36, and then off horizontally, $9.65 for a 40 inch pipe per lineal foot laid. This chart has been used in computing the lengths and sizes of pipes put down as stated by Mr. Simpson and his statement checks out to within a very small percentage as being as near as an engineer can come to being entirely correct provided the lengths and sizes given are correct.

Q. As given by Mr. Simpson?

A. Yes.

Mr. Burr: I offer it in evidence.

Mr. Mathewson: Then this corroborates him instead of contradicting him, so far as it goes?

The Witness: Mr. Simpson's statements are correct so far as the lengths and diameters put down are given.

Mr. Mathewson: I should like to ask the witness one or two questions before the chart is received in evidence.

Mr. Burr: I have no objection.

2370 By Mr. Mathewson:

Q. Have you ever laid any mains in the City of New York?

A. I have not.

Q. Where have you ever laid mains?

A. In St. Louis.

Q. How long ago?

A. Some thirty years ago.

Q. Have you laid any since anywhere?

A. In Durham some two years ago.

Q. Durham, North Carolina?

A. Durham, North Carolina, some two years ago.

Q. Were there asphalt streets there?

A. No. And in Fostoria, Ohio.

Q. How long ago,

A. Four or five years ago.

Q. Did you yourself lay them or were you the superintendent of the laying at that time in Fostoria?

A. I did pretty nearly everything but dig the ditch and caulk the pipes.

Q. Did you meet there the rock conditions you meet in New York City?

A. No rocks there at all. That is provided for, however, in the chart.

Q. How many miles of mains did you lay in Durham and Fostoria?

A. Some ten or twelve miles, if I remember rightly, in Durham and in Fostoria there was something more, I cannot recall it now.

Mr. Mathewson: I press my objection, Mr. Master. It does not seem to us that he is qualified to state the cost of laying mains in the city of New York, and I make the objection as a matter of principle, although it corroborates Mr. Simpson, because I do not think the witness is justified in making it.

The Master: I will overrule the objection.

Mr. Mathewson: Exception.

Mr. Burr: It corroborates Mr. Simpson to a certain extent.

Mr. Mathewson: Fully as to prices and cost.

2371 Paper received in evidence and marked City's Exhibit 50.

The Witness: May I go on?

By Mr. Burr:

Q. Yes.

A. It has been stated repeatedly in the evidence that these mains are largely duplicated, sometimes triplicated and sometimes quadruplicated in the streets of New York City——

Mr. Mathewson: I move to strike that out, Mr. Master. I do not think it is a correct statement, and if it were it would not add anything to the testimony, whatever it is.

Mr. Burr: He is going to base something upon that statement. Do you want to strike out the original statement?

The Master: I do not think you will save a great deal of time by making these objections, although I think most of them are well founded, but I think you had better go on and let the Doctor make his speeches——

Mr. Burr: I do not think he is making speeches; he is giving testimony. If he has to give it in the form he is now giving his testimony, it is due to the fact that the Company has refused to allow him access to the books and——

The Master: If the evidence shows that it is a fact that the mains are duplicated, it is not necessary to call a witness to testify to it.

Mr. Burr: He is going to base some testimony on that fact.

The Master: But that is not the question you have asked him, which is a different thing.

2372 Q. Proceed, Doctor.

The Master: The motion to strike it out is granted. It is not responsive to any question that I know of.

Q. What is this other diagram that you have prepared?

A. It shows what a system of mains laid as a substitute for a duplicate system would cost, on the same chart.

Mr. BURR: I offer that in evidence.

Mr. MATHEWSON: I object to this. No foundation has been laid for any such table or testimony as this. It does not appear where mains have been duplicated or between what streets, and the witness is not competent or it seems to me to testify as to laying a duplicate set of mains. He is not familiar with the requirements of this city and could not possibly be, or with the location of mains.

The MASTER: I will take it.

Mr. MATHEWSON: Exception.

Paper received and marked City's Exhibit 51.

Q. Now will you explain this diagram, City's Exhibit 51 in detail, Doctor?

A. Taking the total cost minus 15 per cent. contractor's profit and the statements as to lengths and sizes made by Mr. Simpson, a computation, assuming the pipes to be under cobble pavement as an average, is $7,901,682.26, which is very close indeed to what he has stated. Taking a single pipe substituted of equal or greater capacity than a double pipe we obtain $5,935,155.12 or in round figures about $2,000,000.00 less cost for a regularly laid out system of mains of equal or greater capacity.

Mr. MATHEWSON: What is this total cost?

2373 Q. Than is charged by the Consolidated Company here?

A. Than is charged by the Consolidated Gas Company here.

By Mr. MATHEWSON:

Q. What is this total cost?

A. It approximates to their taxed cost.

Q. What is your total cost, $6,982,535.44?

A. It includes the contractor's profit you know, which Mr. Simpson did not make.

Q. Will you turn your attention to the meter account presented by the Consolidated Gas Company, page 1904. What items of——

A. I find under the head of meters, scows $19,816.15; gas stoves $287,619.77, a total of $307,435.92, which can bear no possible relation to meters or their expenses.

Q. Then as the result of this analysis, what have you found with regard to these items of land, manufacturing plants, mains, services and meters?

Mr. MATHEWSON: What do you mean by that?

Mr. BURR: Adding up the totals that he has now given.

A. Land, $3,068,140.51; manufacturing plants and holders, $12,866,766.62; mains, $7,700,151.03; from which should be subtracted, if a duplicate system is deemed improper, about two million dollars; services, $1,212,071.09; meter, less scows and gas stoves, $3,495,108.58.

Q. A total of——

A. A total of $28,342,237.83.

Q. And deducting the $2,000,000 to which you referred?

A. $26,342,237.83.

Q. What does that represent?

A. This is the structural cost of the active stations of the Consolidated Gas Company so far as it can be gathered from the books.

Mr. **Mathewson**: By you.

2374 Q. So far as it can be gathered from the testimony?

A. And from the books accessible.

Q. And the exhibits here?

A. And the exhibits here. The discussion and investigation was made more particularly for the purpose of locating the sophisticated accounts.

Q. How does that compare with the structural cost required from the Massachusetts precedents that you have testified regarding?

A. When comparing with the Massachusetts precedents, it gives a structural cost of about $5,000,000 more than that obtained from the Massachusetts precedents.

Q. And that is not adding the $2,000,000 which you say should be deducted from the mains?

A. No.

Q. So that would make $7,000,000,

A. $7,000,000—no, it would make three millions more, not seven millions.

Q. Now, if you use the valuation that has been given of the existing Consolidated Gas Company's stations, $18,546,640.58, and subtract it from your figures just given, what do you find?

A. If we subtract $18,546,640.58 from the $28,342,237.83 we obtain $9,795,597.25, and it is probable that the proper cost in Massachusetts precedents is somewhat less, making every allowance, than the $29,000,000 to $30,000,000 stated by the Gas and Electricity Commission.

Q. How can exact figures be obtained with regard to these matters you have been testifying to?

A. By a careful inventory of the works as they stand and by a thorough examination of the books continued back through every book to the vouchers and checks and check stubs, and only in that way.

Q. Now, will you, so we may have the record complete, briefly give us a resume of your statements as given here?

2375 A. In 1905 the sales of gas in the Borough of Manhattan amounted to 19,540,343,000 c. f., of which the Consolidated Gas Company sold 13,283,164,000 c. f. or about 68 per cent.

If the Consolidated Gas Company and other gas companies accept 80 cents to private consumers and 75 cents to the City, the sales of gas in 1907 on the Island of Manhattan will amount to 22,569,,846,000 c. f., of which the Consolidated Gas Company will sell about 15,340,000,000 c. f., realizing a gross revenue of $12,274,000.

From the unverified figures of Complainant's Exhibit 94, summary of operations for the calendar year of 1905, it would appear as if the cash cost of gas had been about 53½ cents, and might be anything below this to 44 cents per M. c. f. of sales at the consumer's meter for gas averaging 23.1 c. p.

Using English accountants' methods for computing the cost of gas and the unverified and doubtful items of Complainant's Exhibit 94, summary of operations for the calendar year 1905, the apparent cash cost of gas is found to be 53.51 cents per M. c. f. of gas sold and the total net earnings $6,175,342.94 as against net earnings $4,587,995.99 (Complainant's Exhibit 96) or a somewhat larger sum, $4,765,670.00, derived from the figures of Messrs. Addicks & Humphreys.

With the price of gas at 80 cents and its cost at 53½ cents, the net earnings for 1907 will be $4,065,895.00, or if we take the cost of gas of 22 candle power as found at Chicago to be 45½ cents per M. c. f. of sales, we would have a net earnings of $5,293,335.00.

The matter of a reserve fund of five cents per thousand cubic feet of sales claimed by Pres. Alexander C. Humphreys and for three cents per thousand cubic feet of sales as claimed by Vice-President Walter R. Addicks can well be eliminated since it is clearly shown that a very large surplus accumulated by the Consolidated 2376 Gas Company from the profits of its business has been invested in other enterprises, from which any future surplus required could be obtained.

The matter of an extra allowance for oil for increased illumination is also shown to be unnecessary, since the average illuminating power for the first six months of 1905 is proved to be 22 candle and for the last six months to be 24.19 candles. The excessive use of oil at prices far above those obtained by many lesser companies has added considerably to the apparent cost of 53½ cents per thousand cubic feet of sales.

Concerning the actual structural cost of gas works, it appears that so far as the stockholders were concerned in the consolidation of 1884 nothing was sold and nothing was paid for in money. The only things that were done were to produce an exaggerated inventory of the cost of the works and then to sophisticate the new books of the Consolidated Gas Company to conform to the fictitious capitalization effected.

It was simply a case of the old firm trading under a new name with 2.3 times as much capitalization.

A careful comparison of the structural cost of the four gas companies operating in Massachusetts, has revealed the fact that under similar conditions to those to-day existing in the works of the Consolidated Gas Company, their structural cost is $1.78 per annual M. c. f. of sales or of capacity, and the total cost of the works of the Consolidated Gas Company should be $18,546,640.58 with an allowance of $5,097,389.56 for investment in other companies or additional structures and an active capital of $1,626,811.32 required for the operation of the works, making a required total of $25,670,841.46.

The investigation of the accounts of the consolidated Gas Company has not been possible in any proper sense, but the frag-2377 ments accessible have been used primarily to show in instance after instance the sophistication of nearly every account which has been presented in any form in the testimony given by the witnesses of the Consolidated Gas Company.

Mr. MATHEWSON: I move to strike out the last statement of the witness.

The MASTER: Strike it out.

Q. What would you say with regard to the capitalization of the gas companies on the Island of Manhattan being limited to less than $2.00 per annual thousand.

Mr. MATHEWSON: I do not understand the question. I think if I do, it is objectionable.

(Question read by Stenographer.)

Mr. MATHEWSON: This is not a question of what capitalization shall be issued by the companies. It is a question, it seems to me, of value of property and returns upon that property.

The MASTER: I do not understand the question. Will you read it?

Mr. BURR: I will withdraw the question.

Q. As the result of your experience and your study of the situation as presented here by the testimony and the exhibits and your study of the proceedings before the Gas Commission and before the Commission of 1885 and 1886, what in your opinion should be the capitalization per M. fixed for gas companies in the Island of Manhattan?

Mr. MATHEWSON: Objected to as irrelevant and immaterial, and the witness is not competent to testify.

2378 The MASTER: Well, that is probably all true, but I will let him answer and give you an exception.

Mr. MATHEWSON: Exception.

A. I should be inclined to fix the limit to capitalization of gas companies situated as is the Consolidated Gas Company and the other gas companies also on the Island of Manhattan to not more than $2.00 per annual M. c. f. of gas sales.

Q. And have you any opinion to express with regard to the advisability of adopting a system of accounting similar to that used by the English gas companies, than that which reveals itself to be used by the Consolidated Gas Company in the testimony presented here?

Mr. MATHEWSON: Objected to as immaterial and irrelevant. I do not want to make technical objections, but it is worth while for us to call witnesses to show that they think otherwise?

The MASTER: I do not think that is valuable, and if you want to press it, I will sustain the objection.

Mr. BURR: In other words, as the result of his experience and previous study of this subject——

The MASTER: No doubt they could improve their methods. Everybody can. There is no question about it. That is all it amounts to. He thinks it would be better to keep their books in the English style rather than the way they do.

Mr. BURR: Yes.

The MASTER: What difference does it make if he does think so?

Mr. Burr: I thought it might be interesting.

2379 The Master: I will sustain the objection and you may take the answer.

Exception.

A. Both for the sake of the company and for the public, it appears to me an imperative need that the accounts of the quasi public corporations should be kept after the manner, although perhaps varying in detail, prescribed by Acts of Parliament in England and that there should be the same publicity, not only to the stockholders but to the public, insisted upon in the opening of accounts to the authorities, to the justices and to the general public, if they are willing to pay the trifling sum demanded for the printed accounts.

Q. Have you the English Statute to which you refer, Doctor, handy?

Mr. Burr: This I might say is nothing new and is entirely pertinent to this inquiry because I find before the Commission in 1886 that a recommendation similar to the one he now speaks of was made and a form of the English accounting system was attached to the report. I won't bother about offering that in evidence, but I want to call attention to this statute which exists.

The Witness: Referring to Michael & Will on the law relating to gas and water, page 219, Model Gas Bill as amended in 1900 prescribed——

Mr. Mathewson: What edition?

The Witness: Fifth edition. Model Gas Bill prescribed the form in which franchises——

By the Master:

Q. What Act of Parliament is it?

A. Companies Clauses Act, 1863, was amended by subsequent acts and the Gasworks Clauses Acts 1847, 1871, Companies 2380 Clauses Consolidated Act of 1845, except the provisions relating to the conversion of borrowed money into capital. Pages 220 and including 228. That is in this third edition of Will.

Mr. Burr: I offer in evidence the Gasworks Clauses Act of 1847, Tenth Victoria Cap. 15, an Act for consolidating in one Act certain provisions usually contained in Acts authorizing the making of gasworks for supplying towns with gas, appearing on pages 36 and the following pages of Reeson's Complete Gas & Water Acts, 1817 to 1902, published in London by Butterworth & Company, 1902. I am referring to the modern Gas Bill as amended, 1900, used in England, as the same is printed on page 220 of Michael & Will on the law relating to Gas & Water, fifth edition by J. Shiras Will, K. C., published in London by Butterworth & Company, 1901.

Not marked in evidence.

Q. Now, something has been said here with regard to electrolysis, and were you here when Mr. Simpson testified regarding that?

A. I was.

Q. You heard his testimony?

A. I did.

Q. And you heard him testify that he in two instances found what he thought to be electrolysis effects upon the mains at two different points. Is it a fact that the effect described by him as he was informed by the expert who examined these mains was found, namely, pits in the mains. Is it a fact that that is due entirely or solely to electrolysis?

A. The formation of pits in cast iron gas pipe and sometimes in steel pipe was going on long before the wandering earth currents due to trolley systems and other power systems were in existence.

2381 Wherever a main is laid in alkaline soil and wherever this alkaloid comes in contact with the iron and carbon of cast iron it is very apt to produce pits. That is there is an iron and carbon alkaline battery going on. This is nothing new. It was written about half a century ago and it does not necessarily follow that a power current is required to produce the peculiar form of pitting called electrolysis, because the iron itself in conjunction with an alkaline fluid can do it without any assistance from the outside.

Q. Is there any well known authority who made reference to that situation as you have stated it?

A. There is. I take a very old book on gas engineering, Hughes & Connor, Gas and Gas Works, London. On page 302——

By the MASTER:

Q. London, what is the date? What is the imprint there?

A. There does not appear to be any date on it. This edition was printed in 1904. It was written a good many years ago.

By Mr. BURR:

Q. Proceed.

A. Page 302 (reading:) "There are, however, certain destructive " agencies which materially affect the durability of mains. But it is " said that the worst of all ground in which pipe can be laid in that " containing, ashes, cinders and moisture. In these the pipes are " speedily covered with marks throughout similar to pock marks " some of them eventually penetrating the metal.

"This action is undoubtedly due to the electrical agency by each " of the numerous particles of carbon being in contact with the iron, " which aided by the moisture form little batteries and produce rapid " decay."

2382 Q. So that the so-called electrolysis affected gas and water mains long before the trolley systems having return earth currents of electricity were in use?

A. It did, and consequently you cannot say what would have been done if there had been no wandering earth currents.

Q. And under the conditions you have read there electrolysis *is* will affect pipes in the absence of return earth currents?

A. In the absence of return earth currents.

Q. What is your opinion as to their being any danger in the future of electrolysis to the Consolidated Gas Mains?

A. It appears to be very slight, shall I give my reasons?

Q. Yes, sir.

A. If we take the case of the subway, all electrical engineers take particular pains to make a return circuit through their rail as perfect as they possibly can, either by bonding the ends of the rail with copper bands or by cast joints or by solder joints, so as to allow the current to come back as rapidly as possible to the dynamo which has generated it. The object of this is economy. They desire above all things not to lose power and if the return of the current is obstructed the consequence is that the power is lost in getting back to the dynamo. But assuming an imperfect joint or rail in the subway the structure itself has involved the use of a vast amount of iron, thousands and thousands of tons, and it is much easier for the current, if it has to leave the rail, to take the iron track of the subway than it would be to go off and hunt up a pipe somewhere. Now that is equally true with regard to the surface railways. The conconductors for the surface railways in New York are laid in immense cast iron conduits weighing a great deal and of very great thickness and strength. If the current has to leave the rail the gas or water main is as nothing in presenting a direction to the current as
2383 compared with this immense conduit, and this immense conduit leads directly back to the neighborhood of the generator or dynamo; and, of course, in the case of the elevated railroad, if the current has to leave the rail there, I do not see how it is possible for it to get off the vast mass of iron that leads back. It is a well known law of electricity that the amount of current is inversely in proportion to the resistance. That is to say, an electric current will not take one channel and run along as a stream of water does. It divides itself inversely as to the resistance which is opposed to it; the less resistance the bigger the amount of current. Now it would be hard to find anything that would present less resistance than the enormous iron work of which the subway is constructed, the large cast iron conduits of the surface railways or the complete iron structure of the elevated railway. And so the pipes will probably be left alone for all time.

Q. You heard the testimony of President Humphreys regarding the necessity in his opinion for an allowance of five cents extra to be collected from consumers for the reserve fund?

A. I have.

Q. What have you to say as to that?

A. It would appear to me that President Humphreys neglected to place any limit as to the length of time within which this five cents extra should be collected from the consumers. He also neglected to place any limit as to the amount of accumulation which should cause an end to the collection of five cents extra per thousand cubic feet from the consumers. He also overlooked the fact that under ordinary conditions there was either in cash or invested a very large surplus due to the immense surplus profits of the Consolidated Gas Company in current years.

Q. Did he fix any sum for insurance and reserve for which any further charge should be made of five cents per thousand cubic feet for reserve?

A. He did not.

2384 Mr. Mathewson: Is it worth while to get the witness to testify to that when he has directly contradicted the testimony? Professor Humphreys distinctly stated it would be limited to 10 per cent. on the capital.

The Master: Well, Mr. Mathewson, if that is all so, so much the better for you when you come to make your argument.

Mr. Mathewson: It shows the very cursory examination of the witness, to make a statement of that kind.

Q. Do you know what candle-power the gas that is used in Philadelphia is?

A. 22 candle-power.

Q. That is the same candle-power as called for by this law in question here?

A. It is.

Q. What is the cost of the gas in Philadelphia, if you know?

Mr. Mathewson: I would like to ask the witness whether he has any personal knowledge on the cost of gas in Philadelphia for the year 1905?

The Witness: I was going to say to Mr. Burr that I had no knowledge of the books or the cost of producing gas in Philadelphia. I have knowledge only of the price at which it is sold. I have an opinion, however.

Mr. Mathewson: Oh, well, that is another thing.

By Mr. Burr:

Q. What is your opinion as to the probable cost of the gas as manufactured and sold in Philadelphia and state the ground for your opinion?

Objected to.
Objection sustained.
Exception.

2385 Q. I believe you have been supplied with some data by the officials of Philadelphia with regard to the manufacture and sale of gas in that city?

A. I have been supplied with complete data with reference to the sale of gas in the City of Philadelphia by the Mayor and by the Director of Public Works.

Q. Now, as a result of the data so supplied to you and which is incorporated in the affidavit made by you, submitted to Mr. Justice Lacombe, have you arrived at any opinion as to the cost of gas in Philadelphia?

A. I have.

Mr. Mathewson: Objected to.

The Master: Now, Mr. Burr, do we want that? You know if it is in his affidavit it is already before me under the Equity rule.

Mr. Burr: I am unwilling to waste a moment. That whole subject was gone into in his affidavit, so I shall not pursue it any further.

Mr. Mathewson: Do I understand, Mr. Master, that statements of that sort in the affidavit, are evidence upon which he can present and make a finding?

The **Master**: No, it is before me to show that such an affidavit was made containing such-and-such statements and what was before the Court. I can make a finding to that effect, that an affidavit of such a date, presented on the motion herein, did contain so-and-so and was according to such statements. Of course, it is not primary proof of the facts contained in the affidavit. But, of course, neither would the testimony of the Doctor to-day be. That is my only point, that his testimony could not add anything to what was already in his affidavit.

Mr. **Mathewson**: The point I had in mind was this, if that was to be taken as proofs of the facts and we had not in our affi-
2386 davit met those facts for the reason either that we did not consider it material or for other reasons, that then would leave it uncontradicted, and we should not be put in that position.

The **Master**: No, it would have no evidentiary force at all.

Q. In the affidavit which I have referred to you stated in your opinion that the price at which gas was sold in the City of Philadelphia during the past four years under an arrangement which the U. G. I. or the United Gas Improvement Company had with the City, was 78.1 cents per thousand cubic feet of gas.

A. I did.

Mr. **Mathewson**: Now wait a minute. I object to the testimony of the witness on that subject unless he knows something about it.

The **Master**: The question is not finished yet, as I understand it. It may be superfluous, as the affidavit is already on the files in the case. I understood it was preliminary to asking some question and on that understanding I allow it?

A. I did.

Q. Upon what information or investigation did you base that statement?

A. I based that statement on authoritative documents furnished by the Director of Public Works of Philadelphia, and duly verified.

The **Master**: That all appears in evidence, doesn't it?

Mr. **Burr**: You just said it was not evidentiary proof and I naturally want it as a piece of evidence.

The **Master**: His statement is not any higher quality of proof than the affidavit.

Mr. **Burr**: I should like to have the answer.

2387 A. It was duly verified by public officials.

By the **Master**:

Q. It is hearsay, as far as you are concerned. You have no knowledge of it?

A. Why not at all. It was a duly verified document which was sent to me. If that is hearsay, all right.

The **Master**: I am speaking from the legal standpoint. From that standpoint it is what we call hearsay.

By Mr. **Burr**:

Q. Do you know whether the U. G. I. under its arrangement with the City of Philadelphia supplies free of charge the public lamps there?

A. It does. It supplies a very large number, some twenty thousand lamps free of charge, and supplies the public buildings and the city free of charge. And, besides that, it pays the city ten cents on every thousand feet of gas it sells to the consumers.

By Mr. **Mathewson**:

Q. You know all this from the same source, I suppose?
A. Yes.

By Mr. **Burr**:

Q. I call your attention to a statement appearing upon page 29 of your affidavit and ask you to state what that is and upon what it is based?

A. The statement on page 29 is the tabulated computation of the actual price per one thousand cubic feet received by the United Gas Improvement Company furnishing gas to the city and citizens of Philadelphia, under a contract dated November 12, 1897, figures used to January 1, 1906, candle power of gas, 22.

2388 Q. From whom did you procure that statement?

A. This statement was computed by myself from the original documents furnished by the Director of Public Works of the City of Philadelphia.

Mr. **Burr**: I offer that in evidence.
Mr. **Mathewson**: Same objection.
The **Master**: It is already before me, as I say, under that rule.
Mr. **Burr**: All right, sir.

Q. What have you to say, Doctor, regarding the statement appearing in your affidavit as to the prices of mains and services? You said in your affidavit, page 49, "I have carefully recomputed the "cost of the mains owned by the Consolidated Gas Company "from the inventory given by him (Simpson) and I am of the "opinion that the cost of installation, $7,542,151.03, as given on the "books of the Company, is probably correct and moderate." Have you changed your opinon as the result of this hearing or the evidence produced here or any of the exhibits that have been offered, and if so, please state?

A. Referring to the computation merely on the basis given by Mr. Simpson I have no reason to change my opinion, but referring to subsequent development as to the actual location and as I have said before a duplication and triplication of mains in the streets it appears to me that an allowance should be made for excessive capital investment in mains.

Q. What have you to say, Doctor, if anything regarding the services of the Consolidated Gas Company?

A. I of course have had no opportunity to make a detailed examination of services and I don't know that I could do much better

if I had. It would appear however as though Mr. Simpson's
2389 statement with regard to the cost of putting in the services
was correct and moderate.

Q. You are assuming that the figures given are correct?

A. Assuming Mr. Simpson to be as stated.

Q. That you don't know?

A. That I don't know. I have had no opportunity to examine or check them off.

Q. I will ask you a little more specifically regarding depreciation as it is applied under the English system. Is not depreciation covered in the English companies each year by specific entries upon the Company's books made before computing the year's profit?

A. That is the usual custom.

Q. Is there any allowance made for a depreciation in English companies by adding an estimated sum to the cash cost of making gas?

A. It has never appeared in any statement as to the cost of gas to which I have had access.

Q. Under that system is not the insurance fund made up from the clear profits after dividends have been paid and limited to 5 per cent. of the paid-up capital of the company, allowing only 1 per cent. of that to be set aside each year?

A. That is the usual custom.

By Mr. MATHEWSON:

Q. When you referred to the insurance fund I suppose you mean what we ordinarily call a reserve fund?

A. A contingent fund.

Q. A contingent or reserve fund, whichever you please.

A. A contingent fund, yes, sir.

By Mr. BURR:

Q. Do you know what the investment of the U. G. I. in Philadelphia is claimed to be per thousand cubic feet of gas sold?

A. At the time of my first affidavit it was claimed to be
2390 2.15 dollars per annual thousand cubic feet of gas sold, by
presentation of bills to the city.

I would like to make a little correction in my testimony. I would like to say that on thinking the matter over that I recall that lately President Humphreys has agreed that the reserve fund should be terminated when 10 per cent. of the capital or investment was reached. But I also recall that he did not state this at first.

Q. Is there any other correction that you wish to make just now?

A. None other.

Mr. BURR: That is as far as I can proceed to-day.

At four o'clock p. m. adjourned to Wednesday, October 3rd, 1906, at eleven o'clock a. m.

Last Exhibits:

Complainant's 255.
State's W.
City's 51.

2391 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *October* 3, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby, Mr. Mathewson.

2392 WILLIAM D. MARKS resumed.

Direct examination by Mr. BURR (continued):

Q. Doctor, what did you find the approximate actual cost of the land on which the manufacturing plants of the Consolidated Gas Company are located—I mean land in use?

Mr. MATHEWSON: I object to that on the same grounds, that he is not an expert.

Mr. BURR: He is not testifying as an expert—what he found to be the cost.

The MASTER: Perhaps he means from the testimony.

Mr. BURR: Yes.

The MASTER: Objection overruled.

Exception.

A. As I stated yesterday, about $3,000,000.

Q. You have read the affidavit of Prof. Humphreys which was submitted in rebuttal in this case before Mr. Justice Lacombe?

A. I did.

Q. In that affidavit reference is made to a model gas bill of 1900. Will you explain what that model gas bill is to which he refers?

A. The model gas bill is a form suggested by the members of Parliament or by their advisers, under which companies desiring to obtain franchises for the manufacture and sale of gas are forced to apply, filling in spaces left for the amount of their capital and also for other details in which they may vary from the general run of gas works.

Q. And that is the bill to which you made reference yesterday?

A. That is the bill to which I made reference yesterday.

2393 Q. Now, referring to the English companies to which President Humphreys referred and of which you spoke yesterday, what did you find was the average profit or capital allowed by England on capital invested in gas companies?

Mr. MATHEWSON: I object to that question. It is well known that the basis of capital return abroad is substantially different, particularly in England, from this country. It seems to me it does not aid us any.

The MASTER: I will allow it.

Mr. MATHEWSON: Exception.

A. On page 54 of my first affidavit I tabulated the profit on capital employed by London Metropolitan Gas Companies in 1904 from Field's Analysis, the candle power of the gas being from 14 to 16 candles. The average profit on capital employed as stated from the résumé given in Field's Analysis is 8.24 per cent. This is rather more than would be claimed, because I have subtracted meter rentals, stove rentals and miscellaneous receipts from the net cost of coal and working expenses instead of adding them to the price of gas in order to obtain the profit on capital employed.

Mr. MATHEWSON: May I ask which Field's Analysis you refer to? For which year?

The WITNESS: 1904.

Q. Is the standard dividend allowed gas companies in England fixed by statute, by law?

A. It ranges all the way from 3 to 10 per cent. in some few cases, the majority of standard dividends being 7 per cent. or below.

Q. Is it stated in Field's Analysis, and, if so, will you please refer to it or state it in detail?

Mr. MATHEWSON: Give us the year, because there is one for each year.

2394 A. Referring to Field's Analysis of the principal gas undertakings in England, Scotland and Ireland for the year 1905 on folio 1, the Metropolitan Gas Companies, I find the standard rate of dividends to be as follows:

Gas Light Company—3½ to 5 per cent. There is no 10 per cent. dividend allowed.

The Commercial—3½ to 4 per cent.

Q. When you say Commercial, you are speaking of a company?

A. The Commercial Gas Light Company. I am using the exact abbreviated verbiage of Field's Analysis.

The South Metropolitan—4 per cent.

Of the suburban companies of London, the Brentford 10 per cent. standard dividend allowed on £380,000; 5 per cent. dividend allowed on £50,000; 7 per cent. dividend allowed on £576,920.

Bromley Company—No 10 per cent dividend allowed. 3½ per cent. dividend on £265,700, 5 per cent. on £100,000.

The Croydon Company—10 per cent. dividend on £76,600; 7 per cent. dividend on £100,000; 5 to 7 per cent. on £519,400.

South Suburban—No 10 per cent. dividend allowed; 5 per cent. on £685,767.

Hornsey—10 per cent. dividend allowed on £20,000; 7 per cent. allowed on £278,460.

Mr. MATHEWSON: When you say "allowed," do you mean paid according to that book?

A. Standard rate of dividend.

Q. What is your meaning of the word "allowed"?

Mr. **Burr**: Permitted.

A. Permitted.

Q. Does it say in that book it is permitted?

Mr. **Burr**: It says in the book standard rate.

2395 A. Standard rate, at the heading; you will see it there.

Q. Then what you mean is the standard rate when you say allowed, is that it?

A. That is it.

Leabridge—No 10 per cent. dividend; 5 per cent. on £271,737.

Mitchan—10 per cent. on £100,000; 7 per cent. on £80,000.

Richmond—No 10 per cent.; 5 per cent. on £218,425.

Tottenham—No 10 per cent; 3½ on £400,367; 5 per cent. on £120,000.

Wansworth—No 10 per cent.; 3½ per cent. on £550,905; 5 per cent. on £30,000.

West Ham—5 per cent. on £1,167,401.

West Kent—10 per cent. on £50,000; 7 per cent. on £100,000.

For suburban companies 10 per cent. standard rate of dividends on £626,600 and from 3½ to 7 per cent. on £5,514,882.

By Mr. **Burr**:

Q. The three Metropolitan Companies are the Gas Light, Commercial and South Metropolitan?

A. They are.

Q. And the suburban companies are Brentford, Bromley, Croydon, South Suburban, Hormsey, Leabridge, Mitchan, Richmond, Tottenham, Wansworth, West Ham and West Kent?

A. Yes. I would like to make a note with regard to the Metropolitan Companies, that in the case of the Metropolitan Companies, at the outset some of them were allowed 10 per cent. standard rate of dividend on a portion of their stock, but subsequently, by act of Parliament which specially provided that they should not increase the price or cost of works in case of sale, they were allowed to 2396 convert this 10 per cent. to 4½ and 5 per cent., enabling the same gross profit to be distributed.

Q. And as I understand it, the standard rates of dividend for the Metropolitan Companies is to the Gas Light 3½ to 5 per cent., the Commercial 3½ to 4 per cent. and the South Metropolitan 4 per cent.?

A. It is.

Q. When you refer to these various amounts with the different rates, what distribution is there to be drawn, if any? I notice the column is headed there Capital Authorized and Capital Raised.

A. In the case of the English companies a very complicated method of issuing capital stock and of loaned capital is frequently practiced. For instance, in the case of the Gas Light and Coke

Company, we find at the outset the stock divided as follows (on page 53 of my first affidavit):

(1) Ordinary Stock.
(2) Preference Convertible Stock, first issue.
(3) Preference Convertible Stock, second issue.
(4) Preference Convertible Stock, third issue.
(5) Preference Stock, fourth issue.
(6) Preference Stock, fifth issue.
(7) Stock.

And of loaned capital:

(8) Debentures.
(9) Debenture Stock.
(10) Bonds.

The object apparently being to obtain capital as it is needed in the increase of the demand for gas, and consequently for the capacity of the works.

Q. Do you know what the average price per thousand cubic feet is sold in the city of London?

Mr. MATHEWSON: Objected to as immaterial.
Objection overruled.
Exception.

2397 A. Referring to my first affidavit, page 54, the average price of all metropolitan gas companies of London is about 62 cents for gas ranging from 14 to 15 candle power.

Q. Referring to the English Acts regulating gas companies, what provision, if any, exists regulating the converted stocks in the event of the purchase of the company's undertaking?

A. I read Article 19 as follows:

"Whereas the conversion by this Act authorized may affect the market price of the company's stock, therefore be it enacted that in the event of any purchase of the company's undertaking by a public or a local authority the market price of the company's stock shall not be taken into consideration in determining the price paid for the said undertaking."

Q. Are not these converted stocks especially limited to a low rate of 4 per cent. or 5 per cent. dividend?

A. 3½ per cent. to 5 per cent., the highest.

Q. What do you find from all the data procurable by you is the probable cost of the 22 candle-power gas at the consumers' meters in Philadelphia?

Mr. MATHEWSON: I object to that as irrelevant, and the witness is incompetent to testify. How can we meet it?

The MASTER: I do not think it is of any value at all. I do not think you have to meet it. I will allow it.

Exception.

A. It is my opinion, based on the fact that the geographical locality of Philadelphia is very close to that of New York City, and from what figures I have been able to gather, that if Philadelphia is free of tax owing to its being a municipal gas works to the extent of 6½

cents, or thereabouts, that the probable cost will be in the
2398 neighborhood of 47 cents, with a possibility of being reduced
somewhat below that—47 cents for sales, for gas sold.

Q. The price of gas you know in Philadelphia, do you not?

Mr. MATHEWSON: He testified on that, Mr. Burr, so far as he did know, or did not know, rather.

Mr. BURR: He said the net price was a certain amount yesterday. I want to know what the regular price is in Philadelphia for gas.

A. The price to consumers in Philadelphia is one dollar, of which the City Councils take ten cents for the use of the city.

Q. And besides which the company furnishes free the public lighting?

A. And furnishes free the lighting of public buildings and streets.

Q. And taking that into account, you estimate it sells gas there for 78.1 cents?

A. It has sold gas for the last eight years of 22 candle-power at an average of 78.1 cents per thousand cubic feet.

Q. In President Humphreys' affidavit he refers to the book which you have informed us you have written, and to the 15 per cent. usually allowed to cover profit and depreciation on investment. To what size of towns is this confined and limited?

A. May I ask what page?

Q. He refers to pages 213 and 217 of your book. He quotes from your affidavit, Doctor, the statement made there, to wit: "With a profit ranging "from 8 to 10 per cent. the present price of gas "should be fixed at not more than 75 cents per thousand cubic "feet to consumers in New York City," and then refers to what he claims are some contradictory statements in that regard, appearing in that book at pages 213 and 217. What have you to say in regard to that?

2399 A. Referring to page 213 of "The Finances of Gas and Electric Light and Power Enterprises," near the middle of the page I make the following statement:

"It should be remembered in a general way that one dollar in "the price of each long ton of gas coal means about ten cents per "one thousand in the cost of gas, and that one cent per gallon in "the price of oil used in carbureted water gas means about five cents "per one thousand feet in the cost of gas."

I wish to particularly emphasize the qualifying sentence which follows this:

"These latter three factors, then, should control any attempt to "go below the price of $1 per one thousand cubic feet for gas."

Referring to page 217, I would say that it is quoted from a report on new gas works for a small city.

Q. What is quoted, the statement?

A. The statement: "It is of interest to observe in the following "table that the profit on gas at $1.75 would be somewhat greater "than the 15 per cent. usually allowed to cover profit and depreciation on investment."

In addition to that, I wish to say that wherever I speak of cost of gas in my work on the Finances of Gas and Electric Light and

Power Enterprises I am talking about the actual cost of gas as deduced by an engineer from a thorough investigation of the books and not from accounts which may or may not be correct if written up by a mere accountant not familiar with the technical part of gas making.

Q. In your opinion, is there a difference where a company has newly started as distinguished from a company that has been long in existence?

A. The best example I can give of that is the English practice, where it will be observed that at the outset in many of the companies the stock was limited to a standard dividend of 10 per cent. on the comparatively small sum required to start, 2400 and as the works expanded and the works became greater the result was that subsequent issues of stock came out at lower rates of standard dividends. Take, for instance, the case of the suburban companies referred to in Field's Analysis for 1905. I have not made the figures, but I think that the 10 per cent. stock standard rate dividend amounts to in the neighborhood of only one-tenth of the total issue of the stocks of the surburban companies, nine-tenths of the stock of the suburban companies, speaking in valuation, being limited to a dividend ranging all the way from three and one-half to seven per cent.

Q. Does that apply also to the metropolitan companies?

A. The metropolitan companies appear to have been set apart in many ways. In the early history of London, a period of great depression occurred in the prosperity of the various gas works. There were a large number of gas works, none of them making any dividends, or if they did make dividends they were making small ones, and many of them losing money. They were finally, I think, many of them consolidated in the Gas Light and Coke Company, and a great many investigations were made, and finally they were erected into one company, more particularly the Gas Light and Coke Company, with two other companies which followed. I don't know much about the history of the two subsequent companies. And they had a lot of 10 per cent. standard dividend stock at the outset granted to them, being because of the severe usage which apparently they had received at the outset, but even that has since been converted as related in what I have already stated.

By Mr. MATHEWSON:

Q. It has been about doubled, hasn't it?

2401 A. I looked up the figures once, but I have forgotten them. I could look it up—anybody could look it up.

By Mr. BURR:

Q. Now, in President Humphreys' affidavit he takes 62.56 cents as the cost of gas and uses your methods to produce the selling price. What would you use to produce the selling price of gas proper for New York City?

Mr. MATHEWSON: Dr. Humphryes takes the amount mentioned by the Commission in their statement of cost as 62.56. He does not state that as his own estimate at all.

Mr. **Burr**: The language he uses is this. I will read it as long as Mr. Mathewson objects:

"If for the Consolidated Company we take the cost per thousand " as allowed by the Commission of Gas and Electricity, namely, " 62.56 cents, and adds Mr. Marks' minimum profit of twenty-five " cents, we have a selling price of at least 87.56 cents. If we now " add for depreciation the difference between my 2.6 per cent. " (=6.87 cents per one thousand) and Mr. Marks' 5 per cent. " (=13.21 cents per one thousand), =6.34 cents per one thousand, " and then we have 93.90 cents as the selling price without any allowance for reserve."

What have you to say about that statement which appears in his affidavit?

A. In that statement Doctor Humphreys has taken the price adopted by the Gas and Electricity Commission of 62.56, and he has then added a minimum profit of about 25 cents. Now, had that question been put to me by the Gas and Electricity Commission, I would have stated the actual cash cost of material and labor for gas to have been somewhere between 45 cents and 50 cents per
2402 thousand cubic feet sold. I would further have stated the
actual structural investment to be somewhere in the neighborhood of or less than $2.00 per annual thousand cubic feet of sales. If I took 15 per cent. of two dollars I would have thirty cents to cover the depreciation and the profit, which depreciation was in a rough and ready way intended as a reserve or contingent fund, not using in this book the verbiage which has been so carefully worked out, and when I add this thirty cents first to forty-five cents actual cost of gas, I get as the proper price of gas in New York City seventy-five cents. If I add this thirty cents to fifty cents, which is a higher cash cost of gas, I would, of course, get eighty cents. I intended in this work and all through to write for the average gas manager, who would know these figures pretty closely, or who should know them.

Q. Which figures?

A. Figures of the actual cash cost of gas and paid out for materials and for labor and for current small repairs.

Q. Have you prepared a chart covering the Borough of The Bronx and the estimated increase in population and increase in the consumption of gas in that Borough for the year 1907?

A. I have.

Mr. **Mathewson**: What has the Borough of The Bronx to do with the Consolidated Gas Company?

Mr. **Burr**: It is in evidence here that the Consolidated Gas Company controls all the lighting companies in both Manhattan and The Bronx except the Bronx Gas and Electric Company.

Mr. **Mathewson**: Isn't that another proposition? We are not entitled to charge the consumers of the Northern Union or the Central Union any more than if we did not own that stock.

2403 Mr. **Burr**: We have shown the connection between the Northern Union and the Central Union and the Consolidated Gas Company, so we are taking the precaution to show you the estimated population of The Bronx and the estimated consumption of gas for the year 1907.

Mr. **Mathewson**: I object to it as immaterial and irrelevant and as uselessly cumbering the record.

The **Master**: I will take it.

Exception.

Q. What do you show by that chart?

A. This is a chart giving a graphic record of the sales of gas and the relation between the average price for the gas and the per capita consumption for the Borough of the Bronx for the years 1888 to 1906, including the sales of gas of the Central Union Gas Company, the Northern Union Gas Company, the Westchester Lighting Company, the Yonkers Gas Light Company, the Bronx Gas and Electric Company. It is prepared for the purpose of showing the relation, by means of a heavy line or curve drawn, which exists between the price of gas and the per capita sales of gas resulting from variations in the prices and variations in the population.

Mr. **Burr**: I offer it in evidence.

By Mr. **Mathewson**:

Q. From what source were these sales of gas for each of the companies obtained for each year?

A. Referring to the key in the right-hand upper corner, "T," testimony before Gas and Electric Commission, 1905-1906; "B. D.," Brown's Directory; "P. L.," estimated from public lamps; "I.," information obtained from President of Company; "E.," estimated.

2404 Q. Nothing before the Commission of Gas and Electricity in the shape of testimony as to output for these companies except for 1904 and a very short period theretofore, was there?

A. Each and every figure given for these companies has a key letter to it. For instance, the Central Union Company, 1904, "T" has a gas sales of 1,010,119,700; the Northern Union, marked "T" (testimony before the Gas Commission), has a total gas sales of 371,504,900. The Westchester Lighting Company, marked "E," has a total annual gas sales of 45,635,020.

Q. "E." means estimated, doesn't it?

A. "E." means estimated.

Q. Estimated by you?

A. Estimated by me.

Q. You had no information except your own conjecture on that?

A. Oh, not at all. Every possible means of figuring and information has been exhausted in this matter.

By Mr. **Burr**:

Q. What sort of information did you seek in making up this estimate that you speak of?

A. Always from the president of the companies, with the exception of the Northern Union and the Central Union Gas Companies, and being referred either myself, or by my assistants, to men qualified to give the figures, and in that case the men sometimes very frankly confessed—I refer to the officials of these companies—that they did not have correct figures, but that they could give us an estimate that would be near enough for all practical purposes, meaning by that it would be a very small percentage of error, namely, say, three per cent. either way, something of that sort. It was close enough to establish what I was in search of, corroborative evidence to the truth of the relations generally existing between the output per capita, sales per capita, and the price of gas.

2405 By Mr. MATHEWSON:

Q. Do you mean to say the officers of the Northern Union or the Central Union, any of them, told you they could not tell you the sales of that company for the year?
A. They were not consulted at all.
Q. And as to the other companies they could not tell you the exact sales?
A. In some cases they could not.
Q. *D. B.* means Brown's Directory again, doesn't it?
A. Yes, sir.
Q. What is Brown's Directory?

The MASTER: You asked him that the other day.
Mr. MATHEWSON: I object to this because I do not know whether it is correct or not, and in the second place it seems to me immaterial and irrelevant in any event. I do not think it has been proven sufficiently correct so it is worth anything for statistical purposes if the subject be relevant at all.
The MASTER: Even assuming that it may not have been technically proved, I think it is proper to allow it as it is undoubtedly the basis of some line of testimony that the Doctor is going to give here, and as a part of it I will allow it.
Mr. MATHEWSON: The difficulty is, Mr. Master, that the very purpose of using it as a basis, it not being shown to be reliable whatever, renders all the testimony on it unreliable.
The MASTER: Mr. Burr has to take that risk. You have saved your rights by objections and have called attention to what you regard as the defects in the proof, and if he chooses to rest
2406 his case on some theories that are based on figures that are only estimates instead of as you claim accurate figures, that is his lookout. I do not see that you are hurt. I will overrule the objection and take it.
Mr. MATHEWSON: Exception.
Paper received and marked City's Exhibit 52.

By the MASTER:

Q. As I understand it, this diagram is a continuation of the similar diagram which you introduced the other day, is it not?
A. It is.

Q. Only that it continues that line of work into The Bronx instead of confining it to Manhattan, is that it?

A. By request of the Corporation Counsel.

By Mr. Burr:

Q. This is as far as possible making it for the Borough of The Bronx similar to what you made it for Manhattan?

A. It is.

Mr. Burr: Before I forget it, I want to offer extracts from the English law regulating accounts, 34 and 35 Victoria Chapter 41, as taken from Reeson's Complete Gas and Water Acts, 1817 to 1902.

Paper received and marked City's Exhibit 53.

Q. What do these four columns headed approximate refer to, Doctor?

A. The four columns headed approximate are the results of the additions and other mathematical operations upon the four columns headed C. U. Company, N. U. Company, W. L. Company and B. G. Company. And they give first, the sales per capita in cubic 2407 feet; second, the total sales in cubic feet; third, the sales per capita in dollars and cents; and fourth, the total sales in dollars and cents.

Q. And what is given in the four columns to the right?

Mr. Mathewson: Don't you think it should appear that the last two columns *mean dollars and cents?* There is nothing to indicate it.

The Witness: At the bottom you will find the dollar sign shown. It should have been put at the top.

Q. And the four columns to the right, what do they contain?

A. The four columns to the right take up the individual companies and the data derived from the individual companies.

Q. What kind of data is it, what does it purport to be?

A. Beginning at the top on the right hand side, C. U., or Central Union Company, the total annual sales in cubic feet is given. Under the head of N. U. Company, the total annual sales is given; under the head of W. L. Company the total annual sales is given, and under the head of the B. G. Company the total annual sales in cubic feet is given. These four are added together and carried out to the left hand side under the second column headed "Approximate."

Q. What is the meaning of the irregular line running through the center of the chart?

A. The irregular line is drawn in order to show the variations occurring in the output per capita as variations are made in the price of gas per thousand cubic feet.

Q. Where are the dates fixed?

A. The dates are placed on horizontal lines, for instance, estimated population 257,405 in 1904 has in the same horizontal line with it all of the figures.

Q. In the approximate column?

A. In the approximate column and also in the individual 2408 company's columns.

Q. And that applies all down that line, does it?

A. All through.

Q. And that applies to the chart for the Borough of Manhattan?

A. Also to the Borough of Manhattan. That is the horizontal line—all figures for any given year are always on one horizontal line.

Q. From what source have you taken your statements as to population?

A. The State census for the year 1905 and the United States census for the years 1900 and 1890. In between, the population has been estimated and is so marked, but in many cases in a rude way only from such figures as I could get from the Board of Health and from some election statements as to population.

Mr. Mathewson: I do not see the year 1906 there. Is it in there?

The Witness: The year 1906 is not in. It has not yet passed.

Mr. Mathewson: Then the heading should be changed to 1905?

A. It is to 1906 which is not included.

Q. I assumed this was a chart showing all you have stated from 1888 to and including 1906.

A. No, it is to 1906.

Q. It is to and including 1905?

A. To and including 1905.

The Master: But it includes 1888.

The Witness: It includes 1888.

Q. This is a statement from you, not an estimate as to the future. You have confined yourself to the year 1905?

2409 A. Yes. This is a statement in the case of The Bronx more particularly for the purpose of confirming the work done in the case of the Borough of Manhattan.

Q. And do you find that there was an increase in the consumption of gas as there was a decrease in the price of it in The Bronx?

A. In every case on the average in a general way.

By Mr. Mathewson:

Q. But you have the Westchester Lighting Company and the Yonkers Gas Company in here. Are not part of their sales and operations outside of The Bronx?

A. I can give you all the figures on that if you——

Q. Well, I merely asked a question——

A. They have some. You will notice that Yonkers Company previous to 1900, under the head of W. L., that is, under the head of Westchester Lighting Company, you will observe.

Q. Yes, but my inquiry is as to whether the Westchester Lighting Company does not operate and whether part of its sales are not made outside of The Bronx?

A. Well, there was a great deal of difficulty about that and finally from the president, or rather from the employees of that company, to whom we were referred by the president, the figures were obtained and confined within the Borough of The Bronx. All that is in the form of a memorandum which I can give.

By Mr. Burr:

Q. What do you find to be the increase in the consumption per capita in the Borough of The Bronx between 1888 and 1905?

A. The consumption per capita for the year 1905 was 5,636 cubic feet and the price was $1.01 on an average. In 1888 the consumption per capita was 1,165, and the price of gas was $1.59.

2410 Q. What do you find the variations of price to be if any between those years?

A. At each reduction of price there appears, perhaps not immediately but ultimately, an increase in the consumption per capita, which can be followed along the line; this line is traced for that purpose, so it can be regularly followed from end to end.

Q. Now, Doctor, we will take up the subject of pressure if you please. You are familiar with the statute in the respect that it fixes the minimum and maximum amount of pressure in the city of New York, are you not?

A. I have familiarized myself with it.

Q. What is the object of regulating the pressure of gas, or what good purpose is served by it?

A. For the purpose of consuming gas we have various forms of burners, of mantle lamps, of gas stoves and of heaters, and these require certain pressures in order to operate uniformly and safely. With this object in view it has been found necessary to establish the average pressure or the fixed pressure or a minimum pressure, and of late in this case, a maximum pressure of gas which shall be held in mains and in the service pipes of any gas company furnishing gas to the public.

Q. How is the pressure ascertained, the amount of pressure?

A. The pressure is ascertained in terms of a column of water. There is a glass tube used for this purpose which is bent in the form of a U., and being half-filled with water, one side is put into communication with the gas main and the other left open to the atmosphere; the gas main, having a slightly higher pressure, drives down the water on its side of the U tube and consequently the water rises on the atmospheric side of the U tube as the tube is open to the atmosphere. It is usual to state pressure in inches or in tenths of inches, measured between the two surfaces of water in the U tube.

2411 Q. Won't you demonstrate that for the Master?

A. Unfortunately I forgot that U tube at the last moment, but I will send the boy for it.

Mr. Burr: I thought you might want to see it demonstrated.

Q. What is the English rule with regard to pressure that prevails in London, if you know?

A. As prevailing in London, it is required that the pressure shall not fall below .6 of an inch at any period during the day, and during the hours when lighting is on fall below .10 or ten-tenths, or one inch.

Q. Based upon this column of water which you have described?

A. Based on this column of water that I have described.

Q. Now you have heard the testimony of the witnesses called by the complainant, Mr. Bradley and Mr. Addicks and Prof. Humphreys, I think, was also asked about the pressure, that it was a physical impossibility to comply with the terms of this statute fixing the pressure between one inch and two and one-half inches maximum. Do you agree with that opinion?

A. I do not agree as to the physical impossibility of furnishing gas at all parts of New York at a pressure ranging from a one-inch minimum to a two and one-half inch maximum.

Q. The geographical configuration of New York shows that there is an elevation at certain points of upwards of 250 feet; is not that the fact?

A. That is the fact.

Q. If the Consolidated Gas Company should ask you to do what was necessary to comply with this law, could you do that?

A. I could if I were allowed to expend whatever sum I deemed necessary for the purpose.

Q. What would be necessary to commence with?

2412 A. First of all, the complete survey of the City of New York, giving its topography and differences of level. In turn, then the pressures would have to be established according to these levels and the mains isolated or segregated according to levels throughout New York. It would then be necessary to see that in some method the pressure which comes from the holder usually should be so regulated or modified for each level that it would never go above two and one-half inches or below one inch, and this is physically possible.

Q. During all the years you have testified you have been engaged as a gas engineer and in gas works and electric works, have you familiarized yourself with pressures and the laws regulating pressures, and the operation of pressure as applied to gas?

A. I have.

Q. If you were called upon to interpret this law as a gas engineer and from a scientific standpoint in what way would you construe this law to be operated?

Mr. Mathewson: Fortunately, the witness, perhaps, is not called upon, as I understand it, to interpret this law. That is for the Court.

Mr. Burr: As I understand it, the Court may call in those who are familiar with technical conditions and this is a highly technical situation, and get from them their views as to whether this law could be given a reasonable interpretation. Is not that so?

The Master: Did not some of Mr. Mathewson's witnesses undertake to put an interpretation on the law and did not you gentlemen object to it? How was that?

Mr. Kirby: They were permitted to do so, however.

Mr. Mathewson: No, they were not.

The Master: I think they were.

2413 Mr. Mathewson: We were not permitted to put an interpretation on it at all. It was excluded.

The Master: I do not see how it is competent for a witness to construe the law. I did not see when the question was raised before, nor do I see now. If there are any expressions in it, technical expressions or phrases as to which you think it is proper to ask his expert opinion, I think that you should be allowed to do so.

Mr. **Burr**: I will ask this question.

Q. If the object of a law was to preserve a uniform variation in pressure and assuming the conditions which exist in the City of New York and in the Borough of Manhattan, having the elevation at points that you speak of of 250 feet and taking the pressure at sea level, what way would that uniformity be preserved?

Mr. **Mathewson**: I object to that, Mr. Master, as attempting to get the same point in in a different way. If there is any word in the Act that is technical, perhaps the witness might testify as to what it meant in the art, but I do not think——

Mr. **Burr**: I think the Court is entitled to get all the information he can on this subject. I ask, assuming certain conditions were existing and it was necessary or desirable to have and keep a uniform variation in the pressure, and assuming that there are variations in the levitation of the Borough of Manhattan, how could that uniformity of pressure be preserved with that varying levitation?

The **Master**: He can answer that. I will give you an exception.

Mr. **Mathewson**: Exception.

2414 A. It would be necessary to assume the maximum pressure at sea level at 2½ inches and the minimum pressure at 1 inch. At any point above the sea level the maximum and minimum pressures would rise. At a point 100 feet above the sea level, from the experiments of Doctor Love, I would say that the maximum pressure should be 3 inches and the minimum pressure 1½ inches, as observed with the open U tube. At a point 200 feet above the sea level I should say the maximum pressure should be 3½ inches and the minimum pressure 2 inches at a point 250 feet above the sea level, which is said to be the highest point of Manhattan Island I should say that the maximum pressure would be 3¾ inches and the minimum pressure 2¼ inches; and this would be in an ordinary technical and scientific way a proper construction from an engineer's and gas man's point of view of the law——

Mr. **Mathewson**: Now wait a moment. Is that quite fair for the witness after having heard the ruling of the Court to say what the proper construction is? I move to strike it out.

The **Master**: No, I think you can omit that, Doctor.

Motion granted.

Q. Would this necessitate any change in mains in the City of New York?

A. If the mains of the City of New York as presently existing are adequate in a good and sufficient engineering way to the supply of gas, there is little probability that any change would be required. If, however, it should prove, as it probably has proved, that the sales of gas have so enormously outstripped the anticipation of even those best qualified to judge, it is probable that in some cases they

2415 would have to put in larger mains than they have, but that would be equally true if all their mains happened to be on a dead level.

Q. When pressure is spoken of by gas engineers where is it taken from, is it taken from sea level?

A. If the level is not mentioned.

Q. If the level is not mentioned, is it assumed to be sea level?

A. It is assumed to be at sea level and ordinary atmospheric pressure.

Q. And do you know of any instance in your investigation in the gas business of the City of New York where that assumption is demonstrated by a table or statement by the officials?

A. I do.

Q. Will you point it out, please?

A. In the year 1881 a report of the bureau of Lamps and Gas, January 17, was made marked Exhibit F. in my first affidavit. The pressure of public lamps of the several gas companies——

Mr. BURR: I offer it in evidence.

Mr. MATHEWSON: Is it of any value?

Mr. BURR: Except to corroborate the statement he has made, that in figuring out pressure the pressure has been taken by the officials and is taken and gas engineers take it when not otherwise specified as being at sea level and there is the statement taken at the various elevations in the City of New York commencing at sea level.

Mr. MATHEWSON: I do not think the table shows it, and if in the next place, the companies for their own purposes took the pressure and reduced it to sea level, that would not at all affect the statute passed by the Legislature, and which this tribunal cannot amend, I assume.

Mr. BURR: It helps to show the usual and customary way of figuring out pressure.

2416 Mr. MATHEWSON: No, it does not show anything of the sort. If it did, it would not be of the slightest importance in my judgment.

The MASTER: I will take it.

Mr. MATHEWSON: Exception.

Paper received and marked City's Exhibit 54.

The WITNESS: May I explain it?

Q. Yes.

A. In this table not only the distance in miles from the stations is given but also the elevation above mean high water as established in New York Harbor. In the case of the New York Gas Company, corner of Grand and Gouverneur street, the station is 1.8 miles away from the point of observation, and the point of observation is 34 feet above the level of mean high water. It is very easy to see at once that this was intended for no other purpose than the correction of the observed pressure, the observed pressure below, say——

Mr. MATHEWSON: I move to strike that out. If it is very easy to see, why does the witness have to testify to it? We can make our own deductions from the tables.

The **Master**: Strike it out. It is a matter of argument.

Q. What does that chart show from your experience and in your opinion?

Mr. **Mathewson**: Does it not show what it shows, Mr. Burr? He may say it shows something that we do not think it does show, and will have to put on a witness to say that it shows something else?

Q. This shows the distance in miles from the various stations named in this chart?

A. It does.

2417 Q. And it also shows the elevation above mean high water of each station?

A. It does.

Q. And it shows the hours at which the pressure was taken?

A. It does.

Mr. **Mathewson**: I assume it shows the pressure in tenths, doesn't it?

Q. In your opinion as an expert and gas engineer, what is the meaning of this column, elevation above mean high water?

Mr. **Mathewson**: Objected to as perfectly clear.

The **Master**: It does not require any explanation. As ignorant as I am, I know what that means.

Mr. **Burr**: I mean, if he knows whether it was taken for any special purpose.

Q. What is the meaning——

A. It was taken for the purpose of correcting the observed pressure.

Q. What, if any, need exists for the use of that column?

Mr. **Mathewson**: I object to that as another conclusion which is called for.

Q. Well, in your opinion that was for the purpose of comparing the pressures at these different stations above the level of the sea?

Objected to.

The **Master**: I will allow it.

Mr. **Mathewson**: Exception.

A. It certainly was.

The **Master**: As I understand it, it corroborates his previous testimony.

Mr. **Burr**: Yes.

2418 Mr. **Mathewson**: We do not think it does, at all.

The **Master**: Well, that is your view of it.

Mr. **Burr**: Yes. That is all.

The **Master**: Now Mr. Mathewson.

Mr. **Mathewson**: I considered the subject, Mr. Master, and I do not see how I can properly cross-examine the witness until he has completed his testimony. The counsel on the other side declined absolutely to proceed with Mr. Carter and finish any lines before he had finished, and I find that all these matters are so co-related that it is simply chopping off a little here and there and then stopping before I am through, and I do not think it will hasten it at all if I started. I will say this, that I think the defendants should put the witnesses on as suggested, the real estate witnesses and others, and if it comes to a stop and I can then take up some of these matters and touch on them and save a little time, reserving the balance of my cross-examination, I will try to do so. But I am not prepared now to do so.

Mr. **Burr**: Do I understand the counsel for the complainant refuses to proceed with the cross-examination of this witness whose testimony on the direct has just been concluded?

Mr. **Mathewson**: I do not understand the testimony has been concluded. I understand you intend to ask this witness further questions hereafter.

Mr. **Burr**: I have finished with him.

Mr. **Mathewson**: Finished completely with him?

Mr. **Burr**: Except if I need to call him again for any other purpose.

Mr. **Mathewson**: I would like to know when he proposes to recall him.

2419 Mr. **Burr**: I notified Mr. Mathewson many times that we wanted an inspection of the books and of the plants, and at the last session prior to the adjournment he definitely understood both at an informal meeting before the Master and with counsel for the defendants that we proposed making an application to the court for an inspection of the plants and for an examination of the books, because both those had been refused by counsel for the complainants. Such motions have been made during the recess between the session of September 14 and the first day of October, and they are now returnable before Mr. Justice Lacombe on Friday next. When we reassembled on last Monday, counsel for the defendants presented the situation to the Master and begged leave to have an adjournment until after the application pending before Justice Lacombe had been disposed of, counsel for the complainant protested against any further adjournment and insisted that we proceed, and under the ruling of the Master, we proceeded. Subsequently, Mr. Mathewson, counsel for the complainant, stated that he at last would concede that we had a right to the inspection of the plants——

Mr. **Mathewson**: No, I never conceded it.

Mr. **Burr**: Now, having gone on with Dr. Marks, who is our chief expert for the City of New York and finished with him on the direct, and in view of the fact that they now allow us to inspect the plant, which inspection will take undoubtedly about 30 days, they refuse at this time to go on with the cross-examination of Doctor Marks upon the testimony he has given, based upon all the testimony they have given up to the present time, and I think it is a very unfair position to take, and I think it will be doing an injustice to
2420 the City, and I therefore protest against it.

Mr. **Mathewson**: I have not conceded that you were entitled to the inspection of the plant, and never have and do not now concede it. It is a matter of courtesy. Secondly, Mr. Kirby stated to me yesterday that Dr. Marks was to be called on the valuation of the plants and was to go over them. I understand that is not disputed and I do not propose to be thrown off by any subterfuge that he may be recalled for any other purpose.

Mr. Burr: If there has been any subterfuge, it has been on your side.

Mr. Mathewson: When we had Mr. Carter on, it was said that a motion would be made to strike out his testimony if he was not presented for cross-examination.

Mr. Burr: That was because of the tabloid form in which you presented his evidence.

Mr. Mathewson: Now, if you have other witnesses to put on, whom you do not intend to continue the examination of later on, I will endeavor to cross-examine them as they conclude their testimony.

Mr. Burr: I hardly think that is fair. We were forced to go into the cross-examination of all their witnesses. As far as we could get the information we demanded. Now they have got the information of our witness, and they want 30 days to prepare to cross-examine.

The Master: It seems to me that we will have to pursue a middle course in this to be fair. I do not think Mr. Mathewson ought to be compelled to go on and cross-examine Doctor Marks on any matter that is at all concerned with this inspection of the plants. On the other hand, I think he ought to go on and cross-examine him 2421 as to matters which are fairly and entirely disconnected from the inspection of the plants; as, for example, this last subject you have had this morning, the question of pressure. I presume he will want to cross-examine on that and I see no earthly reason why he could not proceed to cross-examine on that and several other branches of his testimony.

I have no doubt perhaps it would be more convenient to have the cross-examination all at once, but still all these matters are more or less matters of discretion, and it seems to me the fair thing under the circumstances would be to have the cross-examination proceed now so far as it can on matters which are not involved in the inspection.

Mr. Mathewson: The matter of pressure would be involved in the inspection. They would probably inspect our pressure appliances and so forth and will probably testify as to their adequacy.

The Master: You can cross-examine him on that further testimony again, but I think there has been enough here this morning for you to cross-examine him on. That is my view of it.

Mr. Mathewson: Of course, if the Master insists I shall have to do it, but it does not seem to me that I ought to have to do it.

Mr. Burr: We would be ready with Doctor Marks and the expert retained by the State, commencing on Monday——

Mr. Kirby: If I may suggest, on each day of this hearing during this week it has been stated that if the matter is adjourned over until Monday we will be in a position to go on with some real estate experts and witnesses who have not anything to do with the inspection of the plants, but we have made no preparations for 2422 any such testimony during this week for the reason that we understood the examination of Doctor Marks would be lengthy, as it undoubtedly will be, and we cannot go on until we are prepared.

Mr. **Burr**: It disarranges all my plans, because I had no reason to anticipate that we would not proceed at once to cross-examine Dr. Marks, and I had made my arrangements to present my evidence in an orderly way, calling one witness after another, and it seriously interferes with that arrangement.

The **Master**: Those considerations do not appeal to me very strongly. You have had plenty of time to arrange for your real estate experts and you have had all summer and all this recess, and counsel in presenting the case have got to take the ordinary risks of the progress of litigation. I did not perceive that the other side had a great deal of consideration. I made them go on from day to day and stump along the best they could and without much assistance from you, as you delayed them to some extent by asking for statements, and they had to go on. I cannot apply any easier rules to you than I did to them. All requests for delay and every indulgence it seems to me comes from the defendants in this matter, and I do not see any reason why I should grant it.

Mr. **Burr**: I cannot see where we have been indulged.

The **Master**: And any time there has been any suggestion of an early adjournment of the session or a postponement of any kind, they have all come from the defendants with one or two trifling exceptions. And as I say, I made the other people go on, and I
2423 do not see why you defendants, with all your talent and associate counsel and all that cannot go on as well as the other side.

Mr. **Burr**: I have no associate counsel.

The **Master**: Well, I mean that there are two or three of you and that it makes it easier for you to go on.

Mr. **Burr**: I represent the City of New York.

The **Master**: And I think, Mr. Mathewson, you had better proceed as far as you can. Of course, I will not make you go on as to any matter connected with this inspection, and it is going to be difficult for me to say how long you should go on, because these matters are dove-tailed to some extent; but there are certain matters you can go on with. But at the same time, that must not relieve the other side from going on with another witness when the cross-examination is suspended.

Mr. **Burr**: Upon that subject, we telephoned to Mr. Mathewson's office last evening, and he was not there and so we communicated with Messrs. Shearman & Sterling, and Mr. Garver said it would not be necessary to have Mr. Gawtrey here because we have the records of the petitions presented by the Consolidated Gas Company for a reduction in the taxes upon various parcels of property, so we could use time in getting those on the record without Mr. Gawtrey, if that is agreeable.

Mr. **Mathewson**: No doubt, if you will present the petitions he signed or any affidavits he made or anything of that sort, I shall not ask you to have him identify them. There will be no doubt about that. I do not think it will be necessary to have him.

Mr. Burr: If you will go on as far as you can with the
2424 cross-examination of Doctor Marks——

Mr. Mathewson: You know his testimony was only delivered a few moments before the session this morning and I have not had time to look at it.

The Master: The other side had similar disadvantages while you were going on.

Mr. Mathewson: No, but they got adjournments so they could examine these statements.

The Master: No, but they had to work some nights, and I think you will have to, too.

Mr. Mathewson: Is it the instruction of the Master that I shall proceed?

The Master: I think so. I do not think any other way would be fair. I do not see any reason why the whole cross-examination should be held up.

Recess until 2 o'clock.

After Recess.

William D. Marks resumes the stand.

Cross-examination by Mr. Mathewson:

Q. What was the date of the construction of the Laclede Gas Works at St. Louis?

A. During the years 1872 and 1873.

Q. Were you employed by the company or by the contractor constructing the works?

A. I was employed by the contractors, four gentlemen associated for that purpose.

Q. What were your duties?

A. I was primarily constructing and resident engineer for
2425 William Farmer, and confidential accountant, secondarily, for all of the contractors.

Q. Was the contractors' employment merely to construct the plant?

A. It was merely to construct the plant.

Q. The contractors never operated the plant, did they?

A. The contractors did operate the plant?

Q. For how long did they operate it?

A. So far as I was there, for some three or four months.

Q. As a test?

A. No. It was one of those arrangements by which the contractors took pay in stock and bonds for the work and appeared at the inauguration as stockholders and bondholders of the company and became the Board of Directors themselves; in part, at least.

Q. But did the contractors as such operate the works, or did the company operate the works after they were completed?

A. The company operated the works.

Q. Were you the executive officer of the company in charge of the operation of the works?

A. During the time of the contractors' construction I was not. At the time the works were started in, the gentlemen turned the whole matter over to me up to the point where, a large consumption coming on, it was necessary to enlarge their staff, which they did, by the addition of a great number of men, and I left to take work in other engineering matters.

Q. That was three or four months?

A. I should say that. It is a long way back; as near as I can recall it.

Q. What was your position during the operation of the works for the three or four months?

A. I held no official position by name. Mr. S. L. Husted, who was the largest owner and a promoter, as well as one of the contractors for the works, deputed me to act in his stead when he 2426 or Mr. Frederick Cromwell were absent; and they were absent a good deal of the time.

Q. Did you purchase the material during that three or four months for the manufacture of gas, personally?

A. The company made a contract for Youghi-eny coal which was signed by some of the officials there, the terms being arranged by William Farmer, then the engineer in chief.

Q. My question was whether you had charge of the purchase of material?

A. I did not.

Q. Have you ever constructed a gas plant?

A. Yes.

Q. The contract running to you for the construction?

A. Do you mean did I ever take a contract to construct works?

Q. Yes.

A. I never acted as a contractor in the construction of gas works.

Q. Were you ever engaged with any other company than the Laclede Gas Company, except with the Durham, North Carolina, Company—and what was the other you mentioned?

A. The Fostoria Company.

Q. The Fostoria Company?

A. For quite a while I was placed by the president of the Brooklyn Gas Light Company in the position of a factotum to, as he phrased it, "learn the business," anterior to going to the Laclede, in St. Louis.

Q. Previous to that?

A. Previous to that.

Q. Well, subsequent to that had you been connected or had you had charge of the operation of any companies except the Durham Company and the Fostoria Company?

A. I don't recall any now. I may have had.

Q. With the Durham Company, what was your position?

A. First of all, I was employed as engineer, to plan the works, and if I remember rightly—I am not clear on that point—I was made president of it at the time we started in and after some 2427 little time was engaged in getting up the account books in proper shape and operating the works.

Q. Did you have charge of the operation of the works in the purchase of material and supplies and work of that character?

A. At Durham, do you mean?

Q. Yes.

A. At the outset I think everything was entrusted to me. There were gentlemen interested in it who may have acted personally in the matter, but if they did so it was simply to assist me as I was busy with a good many other engineering projects at the time.

Q. Had you any superintendent at Durham who had direct charge of the operations?

A. There was a man there whose name I have forgotten who did a lot of laying of pipes and attended to the brick work and that sort of thing. He was a relic of the previous arrangement of parties who had failed.

Q. Well, I don't care about the details. I am merely asking you direct and rather brief questions.

A. He was utilized as the foreman on the ditch. I don't know that he had the position of superintendent.

Q. How large a plant was Durham, as to sales?

(Witness proceeds to get a book.)

Q. Oh, somewhere near it; I do not care to have it to a thousand feet.

A. The annual sales of gas for the year were estimated at from 16,000,000 to 20,000,000 cubic feet.

Q. What was the output of the Fostoria plant?

A. I am not entirely clear on that, it is too far back, but it was somewhere between 16,000,000 and 24,000,000 cubic feet. I cannot recall.

Q. How far back?

A. Was that?

Q. Yes.

A. Four or five years, I think.

Q. Four or five years ago?

A. Yes.

2428 Q. What was your position there, at Fostoria?

A. I was, I think, made president of the company at the time that I arrived for the purpose of putting in operation, more particularly, a water gas plant which was there, and attended to getting the accounts in proper shape.

Q. Wasn't your connection with the company more in connection with the accounts than it was with the actual operation of the plant?

A. No. They could not get the plant going.

Q. You mean the wheels would not go around?

A. They didn't know apparently how to run a water gas plant, the people out there, and they were operating a little coal gas plant and incidentally I discovered that the accounts were in very bad shape and on saying so I was instructed to get them into proper working shape.

Q. Did you have charge of the purchase of material there, or was that in charge of some one else, the superintendent or purchasing agent?

A. I had charge of the purchase of material there.

Q. Did you personally make it?

A. Yes. I remember now half a dozen different instances in which I purchased material for the company, although I should much prefer that the people who owned the company should have done so.

Q. Have you within the last thirty years operated or had charge of the operation of any gas plants under metropolitan conditions such as prevail in New York City or other large cities in the East?

A. No, I have not.

Q. You have never constructed a plant in any of the New England or Middle Atlantic States, have you?

A. No, I have not. I beg your pardon, if you will allow me to correct that. At the time that Professor Low was engaged in his experimental work on the water gas plant I was deputed by the people of the Brooklyn Gas Light Company to stay with him 2429 and work with him and I remember at that time something was done, but that was away back in the '70's and was nothing more than a trivial matter, comparatively speaking.

Q. Referring to the pressure, you spoke of a minimum requirement in London of one inch in busy hours and .6 at other hours. Is there any maximum requirement as to pressure in London?

A. There is none that I know of.

Q. In your affidavit in this case did you swear that "at a height of 100 feet above the sea or works level, it will be necessary to accept a minimum pressure of 1½ inches and a maximum pressure of 3 inches?"

Mr. **Burr**: What page?

Mr. **Mathewson**: Page 46.

A. I did.

Q. And also that "at a height of 200 feet above the sea it will be necessary to accept a minimum pressure of 2 inches and a maximum pressure of 3½ inches water column?"

A. I did. The assumption being——

Q. Do not give the assumption. I merely asked whether you so swore. I ask you whether you also swore that "at a height of three hundred feet above the works or sea, it will be necessary to accept a minimum pressure of 2½ inches and a maximum pressure of 4 inches water column."

A. Under the existing conditions and connections of the mains of the Consolidated Gas Company, I did so.

Q. And you believe that to be true?

A. It is a law of nature.

Q. Now, did you also say that it is to the interest of gas companies to keep their pressures in their mains just as low as possible in order to avoid a great loss by breakage and excessive use of gas in street lighting?

A. I did.

2430 Q. That is true, isn't it, too?

A. It is true.

Q. Did you also say, that with the great increase of incandescent lighting by means of Welsbach mantles, and of cooking by means of gas stoves, it has been found necessary of late years to increase the gas pressure to about two and one-half inches which pressure is required for the best operation of both incandescent mantle lights and gas stoves?

A. I did.

Q. Did you also say that within reasonable limits, or say not exceeding four inches, the modern high pressures of gas distribution are not in deponent's opinion productive of excessive use of gas, because it is within the power of every user, by means of a stop-cock, to adjust the flame and the flow of gas according to its needs?

A. I did.

Q. And you still believe that to be the fact, do you?

A. Yes, sir, I do.

Q. And in taking record of pressure at any point, is it not the object to show whether the pressures at the particular point of observation are suitable ones for the consumers?

A. It is.

Q. If the pressure to a consumer at any altitude is four inches registered upon a gauge there, it is of no importance, is it, to the consumer what that pressure would be if reduced by formula to sea level so far as it affects him?

A. No, it is of no importance to him.

Q. Referring to the table which you put in, do you know of your own personal knowledge that the pressures which are registered in that table were ever in fact reduced to a sea level uniformity?

A. I certainly have not seen anything more than what is printed there.

Q. In the table?

A. In the table.

Q. Did you take record of pressures in the Durham and Fostoria Companies?

A. It was not necessary.

2431 Q. Well, did you take any?

A. Very careful records in both cases at the station and also at the office, keeping an automatic record on a float gauge of the pressures.

Q. Upon taking those pressures did you reduce those to sea level and have you such a record?

A. I did not.

Q. Do you know of any gas company which in practice does customarily reduce the pressure shown at various points to sea level?

A. The London gas companies prescribe a difference of one-tenth of an inch for the height of a lamp-post above the main which it is served from, the burner of a lamp-post.

Q. But do you know of any company which in fact, reduces upon its records the pressure which is taken at any particular point to sea level, customarily?

A. I do not.

Q. Do gas engineers generally guide themselves as to practical results at any point or points as to the use of appliances by pressures reduced to sea level or to pressures which appear at those points?

A. They guide themselves by the pressures which appear at those points.

Q. Now in reference to the mains of the Consolidated Gas Company you stated that pressure could be equalized and brought as a matter of possibility within the limits of the present law at some future time by installing new lines of mains or by setting off the various districts. How many districts would be required in New York City for that purpose?

A. I stated that the first necessary move would be a careful topographical survey of the whole field served by gas and then on the determination of the various tracts having various levels.

Q. You have not made such a survey?

A. I have not, but I have listened to what Dr. Humphreys had to say in regard to the matter and studied the Geological Survey's charts.

2432 Q. Is it not true that smaller pressure was required twenty years ago than is now required by reason of the fact that flat-flame burners were then more generally used and Welsbach burners and gas stoves were not generally in use?

A. That is true.

Q. Is it not also true that larger mains are now required in order to give a larger pressure than was required when a less pressure was needed for operation of appliances?

A. Exactly the reverse is true.

Q. Will you explain why?

A. Because, in order to get a large quantity of gas through a small main it is necessary to increase the pressure.

Q. Then larger mains are required now, you think, that was my question?

A. I beg pardon, the first question was what, that you asked me?

Q. Whether larger mains were not now required than were required when it was necessary to deliver gas to the flat flame burners?

A. May I ask for the question to which I gave the answer first?

Question read by Stenographer as follows:

"Q. Is it not also true that larger mains are now required in order to give a larger pressure than was required when a less pressure was needed for operation of appliances?"

A. My answer was, exactly the reverse is true.

Q. Is it not true that the London companies in using their one-tenth inch reduction to which you have referred, do this simply to enable them to state with greater accuracy what would be the pressure in the mains below?

A. It is.

Q. The observed pressure, of course, I refer to.

A. Yes.

Q. Did you hear the testimony of Mr. Bradley and Mr. Simpson as to the condition of many of the streets of the City of New York regarding sub-surface structures and that it was impossible 2433 in some of them to put in more mains, to say nothing of larger mains?

A. I did.

Q. How does that affect the possibility of laying out a system of mains towards this pressure regulation?

A. I have had a great deal of experience in putting down electrical conductors and large bodies in the last fifteen or twenty years, and wherever the streets were, I never found any difficulty, if I had to get there, that was insuperable. It was a question of depth and of cost generally.

Q. And any cost of laying a system of mains would naturally add to the capitalization of a company, would it not?

A. It would, yes.

Q. And would require a larger allowance more or less of profit to pay a return on it?

A. Of course.

Q. Did you conclude how many different lines of mains you would have to lay out in the City of New York in order to establish this uniformity of pressure in the future?

A. It will be impossible for anybody to do so until they are furnished with a complete and exact map of the existing mains in the streets of New York.

Q. Would not that be a very expensive proposition to run mains under the subways existing and projected in the City of New York?

A. It is impossible to say until a study has been made of the locality.

Q. Would you think that it would probably be less than millions of dollars to rearrange the mains with the present and proposed subway structure?

A. It would be utterly impossible to say because there is no information furnished.

Q. You have not prepared any estimate of the cost of installation of such a system then?

A. I have not been able to do so.

Q. You from time to time in walking the streets have seen the
conditions down town, I suppose, and in other sections of
2434 the city as to sub-surface structures?

A. I have noted them with a great deal of interest and care.

Q. And you know the lines the subways follow?

A. Yes.

Q. And the projected subways?

A. No, I do not.

Q. Now you have made an estimate of the increased sales of gas to and including the year 1907, and you have testified that the sales you believed of the Consolidated Gas Company in 1907 will be 15,342,000,000 feet and some over. Does this include the gas which is acquired by the Consolidated Gas Company from the other companies as well as of its own manufacture?

A. That point was not taken into consideration at all, as to where the gas was to be produced from.

Q. You gave an estimate of the entire sales of all of the companies in Manhattan for 1907 as 22,569,000,000 feet and something over. Did that include all the gas put out by those companies, including the gas which they have been delivering to the Consolidated Gas Company?

A. It had nothing to do with any company or companies. It was simply the amount of gas which it was probable that the consumers of the Island of Manhattan would demand for their use and would be willing to purchase at 80 cents, irrespective of its source.

Q. That was limited then to sales and not to manufacture, so there is no possibility of duplication there?

A. That is it.

Q. What percentage of increase did you assume in reaching that conclusion?

A. No percentage of increase was assumed.

Q. Did you take the rate of increase as shown in 1899 and 1900 during the gas war in getting a unit from which you could deduce the increase?

A. During the gas war, a period of two years, of which it occupied the middle twelve months very nearly, the price of gas was
2435 reduced by about thirty-three cents. In order to find the
amount of increased sales per capita due to each cent, I took the increase of sales per capita in that two years and divided it by thirty-three cents, which gave me 46½ cubic feet in round figures as the increase per capita due to a reduction of one cent. I then took the proposed reduction of twenty cents and multiplied it into 46½, and it gave me about 929 cubic feet as the probable increase per capita due to reduction in price of twenty cents. That then was taken and added to the existing sales per capita which I had, without reference to anything that had been stated to me, deduced as about 9,250 cubic feet. I ought to say, by the way, that Dr. Humphreys and Vice-President Addicks, one or both of them, agreed upon 9,150 to 9,250 cubic feet, in other words, without any attempt on my part, it corroborated my figures to within about one per cent.

Q. Present output per capita?

A. Yes, 1905. I then added 929 cubic feet to the 9,250 and it gave me 10,179 cubic feet as the probable output per capita during the year 1907, on the assumption that all the gas companies would accept a price of eighty cents.

Q. Did you take into consideration whether that increase at the time of the gas war was due to extraordinary expenditures on the part of the companies or whether it resulted in a corresponding profit to the companies or whether the new business was acquired at an unnatural expense?

A. All of those matters are, of course, outside the possibility of my knowledge. The influence that most strongly urged me, I should say, is my knowledge of the enormous quantities of gas sold where natural gas, costing nothing, is offered at forty cents, thirty-five cents, thirty cents and so on down to ten or twelve cents.

2436 Q. There is no natural gas delivered in New York, is there?

A. No.

Q. You know, do you not, that during the period in question, these companies were making every endeavor, even to laying mains in the streets where the Consolidated Gas Company already had mains, to procure business at almost any expense?

A. I know that has been done in New York City.

Q. Is it not your information that that was the situation at that time, Professor? You lived in New York City at that time?

A. I was here off and on during that time.

Q. Is not that your information, that they were using every expedient to procure business?

A. I cannot say that it was anything more than a general impression.

Q. Was that you general impression?

A. That was my general impression.

Q. Did you compare the increase per capita during those two years with the increase per capita at the time of previous reductions in the price of gas to see that that was not an excessive increase compared with normal conditions?

A. In a general way the curve shown to you here on the chart shows verly clearly that every reduction in the price of gas has, without any very exact figures being attached, always immediately been responded to by an increase in the output per capita. It is apparently a general law. As for instance, when the price of gas in 1897 was $1.20, the output per capita is shown as 6,311 feet, and again in 1898 at $1.15 as 6,595 feet. That is not a long enough period, nor does it happen to coincide so perfectly with the existing conditions as does the period for 1898 and 1900, which was selected for that reason.

Q. Was it not selected for the reason that there was a gas war at that time and the price of gas was reduced somewhat?

2437 A. If I had not known of the existence of a gas war, I would from this curve, in seeking what I wanted, have selected that as as fair and impartial a basis as I could find, acting entirely without any partisan spirit of any sort or kind.

Q. Is it not true that the sales of gas per capita is increased and has increased at just as great proportion when the price remained stationary as when it has been dropped, does it not so appear from your chart to be the case?

A. It does not. On the contrary it shows that the increase per capita in the year 1905 became a decrease as compared with the year 1904, and that from 1903 the increase to 1904 per capita was very small. This is verified too, by a reference to the chart of The Bronx.

Q. During the years 1902 and 1903 the price remained a dollar in the City of New York, didn't it?

A. It did.

Q. According to an exhibit in evidence, the sales per mile of main increased from 14,340,225 feet to 16,112,865 feet during that twelve months.

Mr. Burr: From what exhibit are you reading those last figures?

Mr. Mathewson: I cannot tell you the exhibit.

Mr. Burr: What statement is it?

Mr. MATHEWSON: Average sales per mile of mains and average sales per active meter, which was put in evidence some time ago.

Q. That had no relation to any change in price. What in your judgment was that due to?

A. Looking at the charter for 1901——

Q. 1902 to 1903?

A. And 1902, taking those as consecutive, there appears to be an increase in sales per capita of 563 cubic feet, an increase of sales per capita; and I am not talking about the gross sales; and 2438 the population going forward steadily. Following that now, further to 1903, there appears to be an increase of 730 cubic feet per capita. In both those cases that increase is due to the life and the increased population of a metropolis. The study of the case shows decidedly that with the increased population and the manner of life of a metropolis that the demands, the individual demands per capita are greater than they are in smaller cities. Going up to 1904 a reverse movement begins. It has slowed down very much there.

Q. Do you know what the increase in sales of the Consolidated Gas Company was for 1905 compared to 1904?

A. I can figure it for you if you like.

Q. Gross sales?

A. It appears from the chart to be in the neighborhood of 113,404,000 cubic feet, if I have not made a mistake in my figures.

Q. In output 113,404,000?

A. In both of these cases it is taken from the testimony, in 1904 and 1905, the testimony before the Gas and Electric Commission. It is the sales and not the output.

Q. As a matter of fact, do not the sales per capita for 1905 appear by your chart to be less than they were in 1904?

A. Yes, they are.

Q. So there was a drop there which could not have been due to any raising in the price of gas?

A. It was due to the fact that the price was not dropped.

Q. But it was not due to any raising in the price of gas was it?

A. There was a slight raise between 1904 and 1905, of just one cent.

Q. What, one cent?

A. Yes, in 1904 the price of gas was averaged at 99 cents and in 1905 it averaged at one dollar.

Q. But don't you know that the private consumers in the City of New York paid one dollar in both these years and that any 2439 difference is due to the amount that went to the city or some other feature of that kind?

A. I presume that is the case.

Q. So that there was a drop there in spite of the fact that the price of gas remained stationary?

A. There was a drop there in the output, per capita, yes.

Q. Now, is it not a fact that in 1902 and 1903 the large increase in the sales of the company both in per capita and gross sales was largely due to the coal strike which compelled people to use gas for fuel and had no relation to price so long as the price remained identical for those two years?

A. I have had no opportunity to look into that matter.

Q. Have you any doubt about that, that the coal strike had a large influence on the increase?

A. I expect it had.

Q. Then you do not think that every increase in the sales of gas per capita and in gross is due to the price at which it is sold?

A. Speaking of specific instances, other factors can come in and influence the consumption per capita, as you have mentioned, but on the other hand it is proper to say that the reduction in price will cause an increase in sales per capita.

Q. Did you not say in your book, to which reference has been made, at page 213, that "it must not be assumed that in every instance reduction in price will insure increase in consumption per capita, as might at first appear to be the case?"

A. Looking at this in connection with the context——

Q. I simply asked you if you so stated in your book. I would like to know in the first place whether you did say so before you explain it?

A. In connection with the context, "Instance" refers to the various cities of the State of Massachusetts.

Q. You have taken the cities of the State of Massachusetts and compared them with conditions in New York in your previous
2440 testimony, have you not, certain cities?

A. I have been very careful not to do so in the matter of the cost of gas.

Q. We are speaking now about the effect of a change of price in sales per capita, and I asked you whether you did not say in your books that "it must not be assumed that in every instance reduction in price will ensure increase in consumption per capita, as might at first appear to be the case?"

A. I did so, meaning by the word "Instance," cities.

Q. Now, if you have a per capita consumption the largest of any city in the world already, there is not that same opportunity for increase in consumption per capita as there would be if the per capita consumption of New York were very small, would there be?

A. There is even greater opportunity.

Q. You think there is no limit to the increase per capita consumption?

A. There is no limit.

Q. Do you expect to continue increasing at the rate you have indicated forever?

A. If you are able to reduce the price, yes.

Q. Is not there a point where people use all the gas they need and no price will induce them to buy more gas than they need merely because it is cheap?

A. That point might be found in some of the communities using natural gas, but it is a long ways beyond anything that has ever been heard of in New York.

Q. Do I understand you to say that natural gas costs nothing?

A. To manufacture.

Q. Well, but it costs something before it reaches a consumer, doesn't it?

A. Certainly.

Q. Does it not cost something before it reaches the distributing system?

A. It has to be distributed.

Q. Does it not cost something before it reaches the distributing system at all?

A. It may cost the investment in a well.

2441 Q. Do you know how many cents per thousand it does cost ordinarily before it reaches a distributing system within a reasonable distance?

A. That cannot be stated. In every individual case of drilling for natural gas it varies and is different.

Q. Does not a period of prosperity or a period of depression affect the sales of gas like the sales of any other commodity for which people have to pay their money?

A. I can only give you my impression on that point, and it is that gas and flour and two or three other things of that sort are not varied by any season of prosperity or the reverse to any appreciable extent.

Q. You do not think then that the period of prosperity which we have been going through from 1896 down to date has anything to do with the increase in the sales of gas of the Consolidated Gas Company?

A. I could hardly say that, because it has undoubtedly caused the erection of many buildings requiring gas, but it has not varied the use of the individual consumer very much.

Q. Well, now, let me call your attention to the exhibit in evidence, which shows that in 1893 beginning for that year that the sales of gas in gross by the Consolidated Gas Company per mile of mains were 8,812,618 cubic feet, and that in 1897, which ended the period of depression five years later, the sales per mile of mains had actually fallen to 8,567,832 cubic feet. Don't you think that that failure to increase and the actual fall during those five years had some relation to the period of depression through which the country was going from 1893 to 1896?

A. Has any statement been made as to possible variation in the lengths of mains during that period?

Q. Oh, yes.

A. Is it given there?

Q. It is. It is given in one of the exhibits of the case.

A. No, but I mean in this case what was it?

2442 Q. In 1892 the miles of active mains from which services were then operating was 777 and a fraction miles, and in 1897 it was 792 and a fraction miles, that is only fifteen miles difference.

Mr. Burr: What page are you reading from?

Mr. Mathewson: It is from page 2192 of the Gas Commission record.

A. From this—I may be wrong in my computations—it appears that in 1897 the miles of active main were 792.60 and in 1893 the miles of active main were 777.75. The difference between those is 15 miles, or something over two per cent. increase.

Q. In the miles of main. Now taking the gas for the same time in 1893 the sales per miles of main were 8,813,000, and in 1897, 8,567,832 or 8,568,000, and the difference is 254,000 cubic feet, which is somewhere between two and three per cent. of the highest output which was in 1893. The one balances the other to a large extent, showing that the total output has probably not largely increased.

Q. That all may be so, but isn't it the fact if this exhibit is correct that in spite of an increase of 15 miles in active main the output per mile of mains in 1897 at the end of the period of depression was actually less per mile of mains than it was in 1893?

A. No, there were more miles of mains.

Q. But the output per mile of mains was less in 1897 than in 1893?

A. Yes.

Q. Now will you look at the same table and say whether it is not a fact that the sales per meter which were 37,863 feet in 1893 has fallen to 30,393 feet in 1897 at the end of the period of depression?

A. It is so stated.

Mr. **Burr**: You are reading from Exhibit 168 before the Gas Commission as it appears upon page 2192?

2443 Mr. **Mathewson**: I have that before me but I am quoting figures which are a part of the evidence in this record.

Q. Do you know in what city the consumption is next largest per capita to the city of New York—I mean what city in the world?

A. It is conceded in the evidence by, I think, Dr. Humphreys, if not Vice-President Addicks, that London is with from 8,000 to 8,500——

Q. You know that the price of gas was reduced there, do you not, from 1901 on substantially by the various companies, or haven't you studied Field's Analysis to that extent?

A. I know of but about one or two years of Field's Analysis of late. It is an old book that has been published a long time. I have not studied enough——

Q. But from the 1905 Field's Analysis it seems to appear that there was a very substantial percentage of reduction in the price of gas from 1901 on and that the rate of increase in London for 1901, the average rate of increase of all the Metropolitan companies, was .92 of one per cent. in 1901, .85 of one per cent. in 1902, an actual decrease of .56 of one per cent. in 1903, an increase of 2.98 per cent. in 1904 and an increase of .49 of one per cent. in 1905, in spite of the reduction in the price of gas. If that is correct, how do you account for the failure to increase at anything like the ratio you have suggested for New York?

A. I am not sufficiently familiar with London, the place is too distant, the customs and the precedents of the place are too fixed to be compared with any community in the United States.

Q. But if the increase in the United States in the use of gas is

2444 due to a reduction in the cost, is not London with its shorter days and foggy days and atmosphere in general more favorable to the use of gas than New York City.

Mr. BURR: That is not in the evidence here.

A. I was very careful in my discussion to confine this to facts in the city of New York, relating those and even avoiding the facts in cities close by New York. I know nothing about the conditions that you stated. I have not familiarized myself with them although it would be very easy to do so.

Q. I thought I heard you refer to the London companies and I supposed you had fully posted yourself on that subject, Professor.

A. I had stated that I considered New York as entirely different from any other community and that too after very careful consideration.

Q. In other words you think that the increase of gas in New York City will be different from the rate of increase in any other city in the country that you know of?

A. Take for instance the case of Philadelphia, I wouldn't think for one moment of comparing the possibilities of Philadelphia with the possibilities of Manhattan Island.

Q. But the output per capita in Philadelphia is not anything like so large now as it is in the Island of Manhattan, is it?

A. I heard the president of the United Gas Improvement Company say not very long ago that it was about 7,500 per capita in Philadelphia.

Q. Now, I would like to have you state if there is any limit, up to what consumption per capita you may select an increase of consumption of gas by the ratio which you have specified, at an increase of 46.46 feet, for the reduction of each one cent in price, or isn't there any limit whatever?

A. I was very careful to limit myself to two years.

2445 Q. My question is how long that is to continue and up to what limit of consumption?

A. I decline to answer beyond two years.

Q. Now, you based your estimate of the consumption of gas in 1907 to some extent, did you not, upon the increase in population in the city which you anticipated?

A. I did.

Q. And is it your supposition that the increase of population in Manhattan Island will continue to increase at the proportion which you took?

A. For two years, yes.

Q. For longer than two years?

A. I don't know.

Q. You have to face a more distant future than two years, have you not, when you will determine the price at which gas shall be sold for the future?

A. If you are safe for two years you are safe for what is beyond that.

Q. Are you familiar with the report of the Commission on additional water supply for the City of New York?

A. I am not.

Q. Will you look at this volume which I show you, entitled, "Messrs. Burr, Herring & Freeman, Engineers," and see what they estimate the population of Manhattan Borough to be in 1925, looking forward some distance.

A. On page 67 you refer to an estimate of Messrs. Burr, Herring & Freeman, 2,130,000.

Q. For 1925, is that correct?

A. For 1925.

Q. And what is the estimate for the other boroughs as specified in that estimate?

A. Bronx 675,000; Brooklyn, 2,705,000; Queens, 680,000; Richmond 130,000.

Q. In other words, their estimate for Manhattan in 1925 is less than your estimation of population for the Borough of Manhattan in 1907, isn't it?

A. 2,130,000, is it?

Q. Yes.

A. That allows an increase to 1925 from the present State census of population of 2,112,380 to 2,130,000.

2446 Q. In other words, they anticipate, do they not, that with the lines of communications to other boroughs and so forth, that the population of Manhattan in 1925 will not be substantially greater than it is to-day?

A. That seems to be their theory.

Q. They are all engineers of repute, are they not?

A. They are.

Q. Now, taking your estimate of the output in 1907, based upon your assumption of increase in the sales per capita and likewise upon your assumption of increase of population, you figure that at 80 cents per thousand the income of the company in 1907 will be only about one million dollars, or to be exact, $956,957.18, less than it was in 1905. But you have provided there for the manufacture and distribution of something like two billion feet of gas in 1907 beyond that distributed in 1905, have you not?

A. Yes, I have predicted that.

Q. It will not be possible then to apply whatever profits you get in 1907 to a return on the same limited capital investment which you have in 1905, will it? In other words, will it not require additional investment in capital in order to provide for the production and distribution of this extra two billion feet of gas?

A. I am not sufficiently familiar with the conditions of these works and stations of the Consolidated Gas Company to express an opinion on that point or as to the amount required.

Q. But you testified that the plants of the Consolidated Gas Company, according to the testimony, had already reached their maximum capacity, taking the daily capacity and multiplying it by 200?

A. I testified that it so appeared, but it is only apparent——

Q. Well, if it so appears and if it so is, because that is the testimoney of the officers of the company, and if you assume that $2.00 is required to provide plants for the production and distribu-

2447 tion of each 1,000 feet of gas as you testified yesterday to be your opinion, that would mean an additional plant, would it not, of about $4,000,000 in addition to the existing plant to provide for the extra two billion feet in 1907 over 1905?

A. I should say that in a general way and as a matter of opinion merely that the plant would increase in cost with the output, assuming the increase of plant to have been in the past what it will be in the future.

Q. The profit in 1907 even if reduced below the profit of 1905 by only this $956,000 must take care of and pay a return upon a plant value in excess of the plant value existing in 1905 of about $4,000,000, if you are correct in your assumptions; is that not correct?

A. If the plant had been established on the basis stated by my figures then that would be correct, partially. Of course with a larger plant you can always expect a decrease in the cost of manufacture somewhat, and certainly if you have an ample distributing system a very considerable decrease in the cost of distribution.

Q. But whatever increase there may be it will not be possible to apply the income of the company in 1907, which will be less upon your theory by $956,000 than that for 1905, to pay a return upon only the plant of the Consolidated Gas Company as existing to-day and producing the gas which it now sells; is that a fair statement. In other words, you have reduced the income by a little less than a million dollars, if your theory is correct, and you will have a greater plant and investment than you have to-day, upon which a return will properly be paid, is that right?

A. To answer you in figures on that point——

Q. I don't ask you to answer that in figures. I ask you whether that is the fact.

A. The question is not sufficiently concise and clear for a concise and definite answer.

2448 Q. I will put it this way: You expect, do you not, that the investment of the Consolidated Gas Company in its manufacturing and distributing plant in 1907, if its output is fifteen billion feet and more, will be greater than the investment required to-day with its output of thirteen billion feet and more?

A. Yes.

Q. And at the same time you estimate that the income of the company will be reduced a little less than a million dollars?

A. The gross income.

Q. The gross income a million dollars.

A. Yes.

Q. And assuming the cost of gas is the same in 1907 as it now is the net income will be reduced by the sam- sum, will it not?

A. Yes; no, the net income will not, excuse me.

Q. Well, why not. With the gas being produced at the same cost in 1907 as it is produced now?

A. Because the profit is on each thousand and the number of thousands turned out in 1907 will be larger than the number of thousands turned out in 1905, and consequently the net profit will be larger in 1907 than the net profit in 1905.

Q. We will assume that the gas costs the same in each year, Professor. You figure out in your testimony that the return in 1905 to the Consolidated Gas Company was $13,000,000 on account of its gas sales, and you then figure, do you not, that taking the output of 1907 as estimated by you at 80 cents, the company would receive only something more than $12,000,000, making an actual decrease in its gross receipts of $956,957.18, is that correct?

A. That is a correct statement, with this qualification, if you please, that I accepted the figures of the company for the sum of $13,000,000——

Q. Oh, I understand that, Professor.

A. Yes.

Q. In other words, the company in 1907 would sell something
like 2,000,000,000 feet more of gas and it would receive in
2449 gross $956,000 less in revenue, and at the same time have
an increased plant and investment in 1907 upon which it
must pay a return above its investment in 1905; is that a fair statement or is not that true?

A. The difficulty in making reply to that question——

Q. Can you not answer?

A. (Continuing)—is due to the fact that the statements of the Consolidated Gas Company's accountants were compared with the statements resulting from computations on a projected possible gas sale at a price of 80 cents. If 13,300,000,000 cubic feet of gas are sold at $1 per thousand, it will produce a gross revenue of equal amount, that is $13,300,000.

Q. If 15,300,000,000 cubic feet of gas were sold at 80 cents——

Q. Won't you look at page 2281 of your testimony——

Mr. **Burr**: Let him complete his answer, please.

The **Witness** (continuing): It will produce a gross revenue of $12,240,000.

By the **Master**:

Q. That is how much less than the other?

A. About $900,000 less.

By Mr. **Mathewson**:

Q. You testified yesterday that the receipts in 1907 upon that basis would be $956,557.18 less?

A. That is more accurate.

Q. Now, I will ask the stenographer to read to you my last previous question again, and ask you whether, assuming the testimony
of the company's officers as to the amount of gas sold and the
2450 amount received for it to be correct, my question does not
state an accurate conclusion.

The **Stenographer** (reading question as follows): In other words, the company in 1907 would sell something like two billion feet more of gas and it would receive in gross $956,000 less in revenue and at the same time have an increased plant and investment in 1907 upon which it must pay return upon its investment in 1905, is that a fair statement, or is not that the truth?

A. Under the assumption of $2.00 capitalization per thousand cubic feet this statement is correct.

Q. Well, if it was $1.00 additional investment required for an additional thousand cubic feet it would still be correct, wouldn't it, and merely involve the question as to how much the investment would have increased in 1907?

A. That is merely a question of proportion.

Q. And at the same time the company would have to pay the cost of the additional two billion feet of gas and over which it sold in 1907, would it not?

A. The cost of manufacture and distribution.

Q. Yes.

A. Yes.

Mr. **Burr**: If you have finished on that point I have a witness from Philadelphia I should like to call for five minutes to verify this statement as to the price of gas by the accountants that I referred to at the time that we offered in evidence the report of the Chicago Gas and Electric Board.

Mr. **Mathewson**: I don't know, I might want to cross-examine him at some length. I have been forced on to the cross-examination of this witness on the stand and I do not think that I ought to assume that I can get through with him immediately. I want to accommodate as much as I can, but—— 2451

Mr. **Burr**: I simply want to call him to verify the letter that is now in evidence that the accountants employed by the City of Chicago found the cost of gas to be as stated in that letter.

Mr. **Mathewson**: If they wrote that letter.

Mr. **Burr**: No, that this man directed the investigation and that was the result as stated in that letter.

Mr. **Mathewson**: I do not think I can consent to five minutes intermission for that purpose. I am afraid it would take too long, Mr. Burr. I think he had better stay over. I may have quite a cross-examination on that point, if that is supposed to be competent at all.

Mr. **Burr**: Well, I will bring all the witnesses you require on that point. Then you decline to allow me to call him for that purpose?

Mr. **Mathewson**: No, I do not decline. I merely say I do not think it would be wise because he could not get through in five minutes, I know.

Mr. **Burr**: How long would you probably take?

Mr. **Mathewson**: I don't know. I would have to look into the report to which you refer and it might take some time. I should hate to have him put on and then be compelled to cross-examine him as you might ask me to, right on the spot.

Mr. **Burr**: Would you let me put in the direct testimony and reserve the right of cross-examination to some later period?

Mr. **Mathewson**: Yes, I will do that.

2452 The **Master**: You agree to reproduce him here or else strike his testimony out?

Mr. **Burr**: Yes.

(Witness withdraws).

JAMES HALL, a witness called on behalf of the City, being first duly sworn, testified as follows:

Direct examination by Mr. BURR:

Q. Are you connected with the firm of Marwick, Mitchell & Company?

A. Yes, manager of the Philadelphia office.

Q. Marwick, Mitchell & Company are engaged in what business?

A. Chartered accountants.

Q. Are you a chartered accountant?

A. Yes, sir.

Q. How long have you been engaged in that?

A. I have been in the business thirteen years.

Q. Was the firm of Marwick, Mitchell & Company employed by the City of Chicago to invest the accounts of the People's Gas & Coke Company of Chicago, Illinois?

A. Yes, sir.

Q. In what year?

A. In the course of the year 1905.

Q. Did you conduct the examination for them?

A. Yes.

Q. Did you make a report to the City of Chicago?

A. Yes.

Q. I show you page 40 of the Report of the Committee on Gas, Light and Electric Light to the City Council of Chicago, January 29, 1906, and ask you whether the paper marked Exhibit A is a correct copy of the report made by you on behalf of the firm of Marwick, Mitchell & Company?

A. Yes, that is a correct copy.

2453 Q. And did you find, as a matter of fact, the difference which is stated here of 8.0746, being the difference as between the price stated of 53.5294 of the Gas Company and 45.4548 as revised by Marwick, Mitchell & Company?

Mr. MATHEWSON: Is that part of the report?

Mr. BURR: Yes.

Mr. MATHEWSON: Are you referring to a statement in the report?

Mr. BURR: In the report.

Mr. MATHEWSON: Then I object to it. The report is the best evidence as to what it says.

Q. Did you find, as a fact, a difference between the cost of manufacturing as stated by the People's Gas Light & Coke Company, and what you found as the result of such examination of their accounts as you have stated you made?

Mr. MATHEWSON: Objected to as irrelevant and immaterial. Is the presumption that we are doing the same thing, or what——

Mr. BURR: Well, we will not indulge in presumptions at this stage.

Mr. MATHEWSON (continuing): If he found a difference between what the company gave and the figures that he figured out——

Mr. **Burr**: It is fully stated in this report which is identified and here is a copy of the report which he swears is a copy.

The **Master**: I will have to exclude it, Mr. Burr, unless you can show something more than appears on the surface as showing it is relevant and material here.

Q. What was your examination of the books of the People's Gas Light Company?

2454 By Mr. **Mathewson**:

Q. Does that not appear in the report itself as to what the result of the examination was?

A. Yes, sir.

Mr. **Burr**: But if he knows of his own knowledge, having made the examination, he is competent to testify. If he can swear to it as a fact I think he is entirely competent to testify to it as a fact. The mere fact he has made a written report does not preclude him from testifying what he finds himself, if he knows it to be the fact.

The **Master**: Is the evidence competent anyway? That is the part that suggests itself to me.

Mr. **Burr**: I asked Doctor Marks what was found to be the price of the manufacture of gas in Chicago?

The **Master**: The cost.

Mr. **Burr**: The cost of the manufacture of gas in Chicago. He gives it at a certain figure and it is objected to and I say I will verify that by the accountants who found it. Now we went to the accountants——

The **Master**: The accountant has testified he examined the books and made a report on them. Now suppose that he testifies one way or the other about this, how is it possible in this proceeding here, without taking out a commission and going to Chicago to have his testimony of any value? How is it possible to cross-examine him? How is it possible to say whether his examination of the books was complete or accurate?

A. You have not got the books here and you cannot produce them here.

Mr. **Burr**: I will ask him this question:

2455 By Mr. **Burr**:

Q. Is it not a fact that the cost of manufacturing and distributing gas, including renewals in the City of Chicago, was stated and claimed by the People's Gas Light & Coke Company to be 53.5294, and that as a matter of fact as a result of your investigation you found the cost of manufacture and cost of distribution including renewals to be 45.4548, making a difference of 8.0746 between the cost as claimed by the company and the cost as found by you as a result of your examination which you testified you made?

A. Yes.

Mr. **Mathewson**: Objected as incompetent, immaterial and irrelevant.

Objection sustained; exception.

Q. That is the fact?

A. Yes, sir.

Q. Did you make a thorough examination?

A. Yes, sir.

Q. With assistants?

A. With assistants, yes, sir.

Q. What was the scope of the examination?

A. We went thoroughly into all the vouchers and further examined all the payrolls and work tickets as used and turned in by the laborers, checked them up against the laborers for the purpose of determining whether all the charges in the revenue accounts were proper charges.

Q. And distinguished between maintenance and capital expenditures?

A. And distinguished between maintenance and capital expenditure.

Q. Could you have made the report you submitted without having made the examination you made?

A. No.

Q. And for the purpose of ascertaining what should be applied to the cost of manufacture and distributing, was it necessary to analyze the maintenance and revenue accounts?

A. Absolutely.

2456 Mr. BURR: That is all. The understanding is that your testimony is taken now, but at a future time at the convenience of counsel you will appear for cross-examination.

The WITNESS: All right, sir.

WILLIAM D. MARKS resumes the stand.

Cross-examination by Mr. MATHEWSON continued:

Q. In reference to your chart showing, or purporting to show, the sales per annum made in 1888 down to 1905 and the sales per capita, there are no details of the chart, are there, which are within your personal knowledge, so far as the figures of output, population, etc., are concerned?

A. I have not operated any works or measured any of the gas.

Q. But it is made up from whatever information you have gathered from Brown's Directory and in some cases your estimate, without personal knowledge on your part, isn't it?

A. My main reliance has been the testimony before the Gas and Electricity Commission.

Q. But there was no testimony given before the Gas and Electricity Commission for any period back of 1900, was there?

A. The list of the total output of the Consolidated Gas Company is given beginning in 1884 and in one of the exhibits and that was utilized from 1888, and as the Consolidated Gas Company appears to have gotten out about two-thirds of all the gas sold on the Island of Manhattan, it made a preponderating quantity which rendered any estimate which might have been slightly one way or the other of comparatively little significance as sources of error.

2457 Q. Was there any such data before the Gas Commission in reference to any of the other companies except the Consolidated Gas Company—I mean sales each year from 1884 down?

A. Referring to the chart, the Standard Gas Company in 1904, from the testimony——

Q. Yes, my question was whether back of the year 1900 there was any testimony before the Gas Commission as to the output of sales of gas of these various companies other than the Consolidated.

A. In 1899 the New York Mutual Gas Company was taken from testimony——

Q. Anything back of that?

A. And the New York Mutual in 1898 and the New York Mutual in 1896.

Q. From what testimony?

A. Testimony given either in the Stevens Commission or before the Gas and Electricity Commission.

Q. Do you remember which?

A. I don't remember which. It is marked "T." It can be found. In 1897 the New York Mutual, in 1895 the New York Mutual, from testimony. And then from 1894 back to 1888, Brown's Directory——

Q. How about the other companies, the New Amsterdam and the Standard?

A. The New Amsterdam Company is from Brown's Directory with intermediate estimates.

Q. Do you know who estimated those intermediates?

A. I did, with the aid of my assistants checkers.

Q. Do you know where Brown's Directory got the figures?

A. Mr. Brown stated he got them by making direct application and sending blanks to the various gas companies. getting his figures from the officials of the companies.

Q. Did he tell you he got the statement from the Standard and New Amsterdam Company?

A. No, he did not specifically name any company.

2458 Q. And the proportions of output which apply to the Consolidated and the per capita and other items there depend then for their accuracy upon these estimates and the information from Brown's Directory, except as far as they appear in the testimony before the Gas Commission — the Stevens Committee, do they?

A. With the exception of the output per capita for 1905 on which I lay a great deal of stress, being 9,250; independent investigation and corresponding very closely to the 9,150 or 9,200 given by Mr. Addicks as a result of his presumably thorough knowledge of all the gas works of Manhattan.

Q. You know he has only been here two or three years, don't you, Mr. Marks, in New York City—do you know that?

A. I knew that he had been here for two or three years.

Q. Do you mean to say he told you he was thoroughly familiar with all the gas works of these other companies outside of the Consolidated?

A. Average ability in a man who had been here two years ought to be able in his position to obtain every figure that was necessary.

Q. If he was directing his attention specifically to getting those figures, that might be so, but do you think he would have in his mind all of these items upon those books with reference to the plants of other companies after being here two years?

A. It would certainly be part of his duty as manager of so stupendous a corporation to post himself thoroughly on all these figures.

Q. Away back to 1888?

A. As far as he can go.

Q. Do you consider that the increase of the per capita sales on which you have figured will come from sales to new consumers or from the increased sales to the old consumers?

2459 A. So far as the population increase influences from sales to new customers; so far as the reduction of price influences, from all the consumers, both old and new.

Q. Will there not be a point where there will be no new consumers except as population grows?

A. I fail to grasp the question.

Q. Well, there will be a point ultimately where there will be no new consumers except by the increase in population? I am trying to find whether there is any limit to your assumption or not?

A. That seems to be rather an academic question.

Q. Well, perhaps it is.

A. Well, I don't know, I am frank to say.

Q. Is it not true that the greater the output of gas as a rule the smaller the consumption per meter?

A. No, indeed.

Q. So that the increase in the gross output results rather from an increased number of consumers than from the consumption by each consumer of a larger amount of gas?

A. That is purely a theory.

Q. Well, is it not carried out by the testimony in this case that shows that in 1885 the sales per meter were 36,038 feet with gas at about $1.70, whereas in 1905 there were only 34,031 feet with gas at $1.00, a reduction of seventy cents. Is that not the experience of the Consolidated Gas Company, if the testimony here is correct?

A. The causes of that I cannot say.

Q. I ask you whether that is not the experience of the gas company, if the testimony here is correct?

A. The experience of the Consolidated Gas Company?

Q. Yes.

A. I presume as you state it is so.

Mr. Burr: The figures speak for themselves, if they are true.

Q. Well, what is the explanation of that?

2460 A. There is nothing so helpless as a big corporation with an antagonistic lot of consumers and patrons, and even though the corporation may be entirely fair in its attitude, really, if the community is against them they lose all the time; people must have gas but they will use just as little as possible.

Q. They use more than they need if they like the corporation, is that correct, or do they use what they need and pay only for what they need, whether they like the corporation or not, in your experience?

A. Their attitude is not rational, perhaps, but they are more generous towards those whom they feel very friendly to. I speak of that as a factor of real value in the management of any corporation.

Q. Will you state any company of which you have ever known where there has been an increase of sales per meter with a large increase in the output of gas?

A. I have never studied the question of the sales per meter, but always as a question of the sales per capita, in a community.

Q. Is it not true that where the company pushes for more business that it as a rule has the larger consumers already on its lines and that the result of its efforts is to get the smaller consumers on, thereby reducing the average and is not the same effect observable where you put out prepayment meters? Does not that all tend to reduce the average consumption per meter as you increase the number of your consumers?

A. Each and every company whether of gas or electricity is a study by itself. You cannot enunciate any generality or law of that sort. It depends upon the community that it happens to be in.

Q. You say you read the testimony before the Stevens Committee and the Gas Commission. Do you recall Professor Bemis' statement before the Gas Commission in substance that local conditions govern the cost of gas in a community and that it cannot be determined from general data? 2461

A. I do not recall it as a specific statement.

Q. You testified that in reference to the cost of gas no examination of the plants of the company has been made and that no examination by experts of the company's books has been made. Were you not aware that the Gas Commission examined all the plants of the Consolidated Gas Company with their engineer, going over them so far as they desired, including the Astoria plant and that the order fixing the price of gas recites their inspection?

A. I testified of that which I had personal knowledge. I know nothing about the doings of the Gas Commission and there was nothing specific and no reports given showing an inventory or an accountant's statement of the investigation.

Q. Did you testify yesterday that the reports of the Gas Commission and of the Stevens Committee were made without any opportunity to inspect the plants or without an inspection?

A. I should change that, perhaps, without making any report of the inspection of the plant and without making any accountant's report of an inspection of the books——

Q. Now, Professor, in view of your statement yesterday, I think it is proper to call your attention to this recital in the order of the Gas Commission fixing the price at 80 cents, page 46 of the complaint: "The said Commission having investigated as to the causes for such complaints and inspected the works, system, plants and methods used by said Consolidated Gas Company in manufacturing and distributing such gas and having examined the books and papers of such company pertaining thereto." Now, do you mean still to say

2462 that the action of the Gas Commission was without any inspection of the plants of the Consolidated Gas Company and without any examination of their papers or vouchers?

Mr. **Burr**: I object to it. How does he know? He does not assume to say——

Mr. **Mathewson**: He should not have said so.

A. I do not assume to say that their action by themselves was without due precaution so far as they are concerned but I do assume to say that they made no report which would enable anybody else save themselves to form any opinion either as to the value of their inventory or as to the value of their accountants' report.

Mr. **Burr**: There is no inventory in the proceeding and no accountants' report.

Mr. **Mathewson**: That is not the point. It is one of many statements, I am sorry to say, that should not have been made.

Q. Why did you state, if you have not any knowledge on the subject, that the action of the Gas Commission was without any examination of the plants of the Company or their books and vouchers?

A. May I see that statement?

Q. Don't you remember such a statement in substance?

A. I do not recall such a statement.

Q. Well, you have your testimony of yesterday?

A. Well, you are referring to it. If you will kindly show it to me——

The **Master**: Was it yesterday or day before yesterday?

Mr. **Mathewson**: Day before yesterday, I think.

Q. Did you read the testimony of Mr. Arthur W. Teal before the Stevens Committee?

2463 A. I read with a great deal of interest his statements as to the cost of gas for four or five years.

Q. Do you know he was the expert engaged by the Stevens Committee to examine the books of the Consolidated Gas Company at the time of their investigation in 1905?

A. I knew he was an accountant engaged for that purpose.

Q. By the Committee?

A. By the Committee.

Q. And did you observe his statement that the cost of gas for those four or five years was 61 and a fraction cents, excluding fixed charges and any reserve fund and also any amount to equalize repairs and renewals with an average term?

A. I noticed that.

Q. Well, you had at least that data to assure yourself when you proceeded to examine the cost of gas, didn't you?

A. I beg your pardon, I have no confidence in that data at all.

Q. Oh, you have not?

A. No.

Mr. **Burr**: He may state his reasons, I suppose?

Mr. **Mathewson**: No, I do not care anything about his reasons.

I assumed that the Stevens Committee expert who examined the books was worth something.

Mr. **Kirby**: Mr. Mathewson knows how far he went in his examination.

Mr. **Burr**: He totaled up the totals, which is what you wanted us to do.

Mr. **Mathewson**: I don't know, I supposed it was entitled to some consideration.

Q. Do you know that his conclusions and statements as to the cost of gas for five years were quoted by the Stevens Committee in their report?

A. Why, yes.

2464 Q. Do you know that in the present case experts representing the city and the State or one or the other have been at the office of the Consolidated Gas Company for two or three weeks going through the accounts of the Company with reference to the cost of gas among other things, that is Exhibit 94.

Mr. **Burr**: Objected to as incompetent, irrelevant and immaterial.

Mr. **Kirby**: And a misstatement of what was in fact the case.

The **Master**: Objection overruled.

Mr. **Burr**: May he explain then?

Q. Did you know that?

A. Am I to answer, Mr. Master?

The **Master**: Yes.

The **Witness**: I heard so. It had no influence on me at all, though I was perfectly indifferent to what the statement might be.

Q. Did you not state yesterday that there has been no comparison of vouchers with accounts in connection with this Exhibit 94?

A. In such a statement as that I referred distinctly to a comparison of vouchers with accounts, of which I am cognizant and in which I have some portion, at least, of authority to determine.

Q. You appear here, do you not, to testify upon the retainer of the City of New York?

A. I do.

Q. And what you mean to say then, when you do state that there has been no comparison of vouchers with accounts and no examination of subsidiary books, is that you yourself have not made such comparisons and examinations, is that correct?

A. I do not mean that.

Q. Do you mean that no such comparison or examination has been made by representatives of the city or of these defendants?

2465 A. I mean that there has been no such examination as is necessary, made by representatives of the city to my knowledge, by experts in the art of gas making.

Q. Well, Mr. Cuthbert, who made the examination, is not an expert in the art of gas making, although he is an expert accountant?

A. A mere accountant may make many blunders in adding up figures. One must have a fairly good knowledge of the business in order to see that accounts are not sophisticated.

Mr. **Kirby**: I think this is entirely misleading. Mr. Cuthbert has made no such examination and the inference of Mr. Mathewson's questions is that he has. They examined what they were permitted to.

Q. Now, do you know of the firm of accountants which made the examination at Chicago?

A. I have heard of them.

Q. They did not have any knowledge of the gas business particularly, did they, so far as you know?

A. I don't know. The first I ever heard of them was within a few days.

Q. And your view would be, if they were not familiar with the gas business and acquainted with that, that their examination would be of little value, would it?

A. Unless directed by some one familiar with the gas business.

Mr. **Burr**: Will you permit me on that subject to ask the Doctor a question?

Mr. **Mathewson**: Well, had you not better wait until I get through, Mr. Burr? If it is important that you ask him right here, I will allow you, but I would prefer to finish my examination first, but go ahead.

2466 By Mr. **Burr**:

Q. Since the adjournment of September 14 did you have any interview with any of the officers of the Consolidated Gas Company for the purpose of procuring an examination such as you thought would be necessary?

A. At the secretary's request, over the telephone, and in response to a request on my part here, to have an opportunity to examine the accounts or at least a few of the accounts of the Consolidated Gas Company, I visited No. 4 Irving Place, the principal office of the Consolidated Gas Company, and had an interview with the secretary, stating to him——

Q. Mr. Carter, do you mean?

A. Mr. Carter. Stating to him what I deemed to be necessary for the purpose of facilitating my work in examining the cost of gas and the cost of the manufacturing plant.

Q. What was the date, September 20?

A. If I remember rightly, it was about September 20.

Q. And as a result of that interview what happened?

A. Mr. Carter promised to write me a letter after consultation with his fellow officers the following morning, and I was about that time called upon on the telephone and told that it would be impossible to grant me access to one account, the real estate, which I had asked; that I was at liberty to examine and compare the ledger which had been put in evidence, and that I should have no opportunity to visit and examine the work, even in a cursory way.

Q. What action, if any, did you take upon receiving that information from Mr. Carter?

A. I at once placed the whole matter before the assistant corporation counsel, and with his approval wrote a letter to Mr. Carter covering the situation.

2467 Q. (Handing paper). Is that a copy of the letter? A. That is.

Q. Will you read it?

Mr. MATHEWSON: I object.

Mr. BURR: You brought this out yourself now. You asked him what facilities he had and I am going to show just what he had and what facilities were denied him.

Mr. MATHEWSON: No, I have not asked as to that. I am asking him as to his statement that no examination of the books had been made, made so broadly that nobody could understand but the one thing, that no examination had been made. Now, he says that he has not made any.

Mr. BURR: I will show this to the Master and let him understand the situation. That is a copy of the letter Mr. Marks sent to Mr. Carter as the result of that refusal to give him the information which he asked. Now, if Mr. Mathewson had not referred to those things I would not have brought that out.

Mr. MATHEWSON: The witness himself brought up the whole subject.

The MASTER: I do not see that it is particularly important. It is subsequent to the day of adjournment and subsequent to the complainant's resting their case. However, I will let it go in if you think it is important.

Mr. BURR: Well, I do. I will ask the witness to read it.

Mr. MATHEWSON: Exception.

The WITNESS (reading):

2468 "OFFICE OF THE CORPORATION COUNSEL OF THE CITY OF NEW YORK, *September* 20, 1906.

Mr. Robert A. Corter, Sec'y, Consolidated Gas Company, 4 Irving Place, N. Y. City.

MY DEAR SIR: Referring to our verbal interview of yesterday, I would say that I had hoped to have a letter from you (as per your promise) this morning, giving your replies to my requests for definite information on the following points:

First: An exact transcript of the Real Estate account of your general ledgers, together with transcripts of the entries from the journal and cash books, which are posted in the Real Estate account of the general ledger, and with permission to examine these accounts and vouchers.

Second: A statement as to the facilities which you could afford me, and a requisite number of assistants in comparing the vouchers and subsidiary books and payrolls, with the entries upon your operating ledgers.

Third: A reply to my request for an opportunity to make a general inspection of the stations and works of the Consolidated Gas Company, with access to the drawings and maps and records, for the purpose of facilitating this inspection, and enabling me, with my assistants, to make a sufficiently accurate inventory and valuation of the existing plants and distributing system, to be satisfactory to the Corporation Counsel.

Referring to your telephone message of this afternoon at 4.30, I understand your verbal reply to be.

First. A refusal of access to or a transcript from the Real 2469 Estate account of your general ledger and other books.

Second. A verbal statement that you will furnish me with all the facilities required for the examination of your operating ledgers in evidence, and a comparison of the vouchers and subsidiary books and payrolls.

Third. You advise me that it will be impossible to permit me to make a visit of inspection, and an inventory of the stations and works of the Consolidated Gas Company, and finally that you prefer not writing any letter at all, but merely acceding to my second request verbally.

It is apparent from this to me, that it is quite impossible to make a complete and satisfactory investigation of the cost of gas, and of the cost of gas works, and that at no time have the various investigators been afforded an opportunity, in a complete and thorough manner, to learn what is imperatively required to make a report worthy of consideration, as accurate and exhaustive.

In view of this situation, which I have communicated to Assistant Corporation Counsel Burr, it is quite apparent that the motion for an investigation of the company's books and vouchers, and an inspection of its plant, must be proceeded with as originally mapped out by the Corporation Counsel.

Yours truly,
(Signed) WILLIAM D. MARKS."

By Mr. Mathewson:

Q. I had not proposed to go further than to call attention to your statements and ask you how you confirm them with the facts 2470 as they were, but this compels me to ask a few more questions. You state in this letter that "at no time have the various investigators been afforded an opportunity, in a complete and thorough manner, to learn what is imperatively required to make a report worthy of consideration, as accurate and exhaustive." Do you mean that the report of the Stevens Committee was not worthy of consideration?

A. I have not in that any reference to anything more than the various parties who have been concerned with myself in this matter.

Q. But you say that at no time have the various investigators been afforded an opportunity, &c. To whom do you refer by the various investigators?

A. There were a number of men, Prof. Bemis is one of them; there were two or three experts who are no longer in the City's employ.

Q. Who are they, what are their names?

A. There was Mr. Witherby——

Mr. Burr: Well, is that material?

The Witness: I think not.

Mr. MATHEWSON: I think it is pretty material, if he has put such statements as these on the record.

The WITNESS: Mr. Beedle, both of whom——

Q. I simply asked you their names. Answer my question if you will.

A. Both of whom were at no time afforded an opportunity to go through the works.

Q. When and from whom did they request such an opportunity and on what occasion?

A. I don't know all the details of this transaction.

2471 Q. Well you seem to state them in your letter with great emphasis, as though you knew all about it, Professor. I am trying to get at if you know what you are talking about?

A. I am speaking of my own knowledge entirely.

Q. When you state that "at no time have the various investigators been afforded an opportunity," &c., "to learn what is imperatively required to make a report worthy of consideration," did you intend to include in the investigators the Stevens Committee?

A. I told you I did not.

Q. Did you intend to include therein the Gas Commission?

A. I told you that so far as that letter was concerned that I referred to those associated with me.

Q. Then I do not understand you to mean that either the Stevens Committee or the Gas Commission were not given an opportunity to make such investigation as they proposed, is that right?

A. I made no reference to them in any way or form.

Q. Have you conferred with Mr. Cuthbert, the accountant for the State, or Mr. Hayward, the accountant for the city, as to the facts that they found upon their examination in this proceeding, of the books of the Consolidated Gas Company?

A. Mr. Cuthbert I have never met. Mr. Hayward I have met and have heard him speak with regard to——

Q. Did you make any request or suggestion that you go with Mr. Hayward when he made his examination or when the books were thrown open to the examination of the defendants' representatives a few weeks ago?

A. I don't know that I specifically asked to go with Mr. Hayward. I have asked at all times, in season and out of season, to be given an equal opportunity with others to see the works and see the books.

2472 Q. Did you make any request or suggestion that you go with Mr. Hayward or at that time while the experts were examining the books in order to satisfy yourself?

A. Of whom do you mean should I make the request?

Q. The counsel for the city?

A. I don't recall that I did at that time.

Q. Did you make any request of any officer of the Consolidated Gas Company at that time that you be permitted to go with Mr. Hayward and join him in any examination of the books which he desired to make?

A. I have made but two requests of the officers of the Consolidated

Gas Company; one for access to the works, to the Vice-President and the other to the Secretary for access to the books.

Q. And this request to the Secretary was after the Complainants had closed their case and all their evidence was in and after the examination by Mr. Hayward had been completed, was it not?

Mr. Burr: By Mr. Hayward?

Mr. Mathewson: Yes.

Mr. Burr: Mr. Hayward never completed that examination and was never afforded an opportunity to make such an investigation as he desired.

Mr. Mathewson: You have made the statement, and I state emphatically, he was given the opportunity to make any investigation he desired, and see any vouchers he desired, as was Mr. Cuthbert, and if he did not, it was his own fault.

Mr. Burr: You gave us the shadow of an investigation while holding back the substance.

Mr. Mathewson: You stated here before the Master repeatedly, that you would wait until you saw what the state expert got, and that if that was not sufficient, Mr. Hayward could ask for anything more that he desired, and he was asked for nothing more. It is getting a little tiresome, this assuming that we have not given you an opportunity. 2473 & 2474

(At 4.40 P. M. an adjournment was taken to 11 o'clock to-morrow morning, October 4th, 1906.)

Last Exhibits:
Complainant's Exhibit 255,
State's Exhibit W,
City's Exhibit 54.

2475 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Thursday, *October* 4, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

2476 William D. Marks resumes the stand.

Cross-examination continued by Mr. Mathewson:

Q. Having computed the profits of the Consolidated Gas Company for the year 1907 on the basis of eighty-cent gas, you proceeded to state on page 2335 of the testimony that this would give the company a profit on the investment in plant as you assumed it, of from ten per cent. to thirteen per cent. What valuation of plant did you use as a divisor to procure that result?

A. At the time that I made that reply I was in great pain from my eyes and I was not as full in my answer as I should have been. It appears probable that with the price of gas fixed at seventy-five cents to the city and at eighty cents to the consumer, that the profit of operation for the year 1907 would be about five million dollars, more or less on an actual structural cost of something less than thirty million dollars. Or, taking figures from complainant's Exhibit 81, investment in the gas business, October 31, 1905, an apparent constructural cost of $40,500,454.99, which has been claimed, or again $49,110,454.99, investments of a tangible nature claimed as required in the gas business, showing a percentage ranging all the way above seventeen in the first case to about ten in the last case.

Q. And in neither case did you in your division and the four million dollars or such a matter which you said yesterday would be required to add the additional plant to produce and distribute this additional two billion feet per annum, did you?

A. From the figures——

Q. Cannot you answer directly?

A. Hardly as a technical question. It is not a technical question.

2477 Q. I merely ask you whether you did add that four million dollars or thereabouts which you said would be required to produce the two billion feet per annum.

A. Agreeing, then, with the request to be brief, that four million dollars was in there. I can explain how it was in there if you wish.

Q. Well, it was not in there if you took the forty million as the company has stated in the one case, or the forty-nine million as it stated in the other; was it?

A. I refer you to my figure of about thirty million dollars.

Q. Was it included in the forty million dollars which you say were the company's figures?

A. The company's figures were taken, as all other figures are taken by me, as being doubtful and for that reason not used as a basis.

Q. But you say you did use the forty million dollars as a basis to compute one of these per cents. Now I ask you whether that forty millions included the additional value of plant that would be required to produce the additional two billion feet.

A. It did not, because I did not think——

Q. I merely asked you whether it did. Won't you give direct answers? If not, I shall have to request the Master to instruct you to do so. Now in computing your apparent profit of about five million dollars in 1907, you take operating expenses at about $8,208,000, if I read you testimony correctly on page 2334; is that right?

A. Page 2334, apparent operating expenses, $8,208,505.

Q. But on page 2333 you state operating expenses for 1905 in the production of thirteen billion feet of gas on that valuation to be $8,786,000, or more than $500,000 more than you allowed for 1907, with two billion feet additional for the latter year; how is that?

A. On page 2333 I took the figures of results of Messrs. Addicks and Humphreys; not my own.

2478 Q. And in this $8,208,505 it is not based upon the testimony of the company's officials here, but upon your own deductions; is that right?

A. The $8,208,505 on page 2334 is obtained by multiplying 15,342,981,000 cubic feet of gas by the apparent cost deduced by myself from the company's data of fifty-three and a half cents.

Q. Eliminating these various items of taxes and one thing and another which you stated you did not eliminate in your previous testimony?

A. Very carefully stated in figures.

Q. So that if those deductions were not justifiable the amount of the operating expenses would be very much in excess of $8,208,000 in 1907, would they not?

A. They would appear to be.

Q. Well, not making those deductions, they were something like $8,786.000 in 1905, weren't they, when only thirteen billion feet or something over of gas was distributed?

A. What page?

Q. Page 2332. In fact, they appear to be stated by you as from the complainant's Exhibit, $8,964,486.98, at the bottom of page 2332?

A. Yes. In complainant's Exhibit 96 for 1905.

Q. You haven't any doubt, have you, upon that basis, the operating expenses in the production of fifteen billion and more feet of gas in 1907 would be very substantially more than the operating expenses upon the same basis for 1905?

A. As a mathematical computation, yes.

Q. So that in that event there would be a very substantial addition to the operating expenses to be deducted from the revenue as computed by you in 1907 and a corresponding reduction in the balance of profit?

A. As a theoretical, mathematical computation, yes.

Q. Now, if I understand you correctly, your theory of the increase of sales due to the reduction of price involves particularly the period from about May, 1899, to about May, 1900, when you testified the price of gas in the gas war was reduced to about sixty-five cents, and you attributed the increase at that time to the fact of the reduction, did you not? 2479

A. Not to sixty-five cents, but to eighty-two cents average.

Q. But the eighty-two cents average included, did it not, the full dollar rate during a considerable part of the year 1899 and the full dollar rate after the gas war was over, in 1900, from May on?

A. It did.

Q. Therefore, there could not be any increase in the sales due to a reduction while that dollar rate was still in existence, and the increase, if it was due at all to the reduction, must have taken place between May, 1899, and May, 1900, and been due to the rate at which gas was then selling, which was sixty-five cents, you stated, isn't that so?

A. I did not so state.

Q. Didn't you state the gas sold at sixty-five cents?

A. I stated the gas sold at sixty-five cents.

Q. During the gas war?

A. During the gas war.

Q. Well, now, let us take the rate of sixty-five cents. The statutory rate at that ime, I should have said, Professor, as stated by you, was $1.15, and not $1.00.

A. At the beginning; if I can find the chart I can find those details.

Q. Was it $1.15 in 1899?

A. From the chart it appears that in 1899 the average price obtained——

Q. (Interrupting.) I didn't ask you that——

A. (Interrupting.) Was eighty-five cents——

Q. I didn't ask you that. I asked you whether the legal rate for gas as permitted by statute was not $1.15 in 1899?

A. On that point I am not informed.

Q. How did you get your thirty-three cents which you
2480 said was the difference between the average rate for that year,
1899, and some other hypothetical or exact rate?

A. Referring to the price of gas for 1898, it has been deduced as averaging $1.15. Referring to the price of gas for 1900, it has been deduced as eighty-two cents. The difference between these two is thirty-three cents.

Q. Now, if the increase in the sales of gas were due to a reduction of price, and the price while it existed was sixty-five cents, that would mean a difference not of thirty-three, but of how much below $1.15?

A. Well, sixty-five cents and $1.15 would be fifty cents.

Q. Now, if you applied fifty cents to the increase in sales which you have testified to and which you use as the main item in getting your 46.46 feet per capita, what would be the result?

A. May I explain to you, Mr. Mathewson, that I have canvassed that question of the divisor in this case very carefully, in which——

Q. I know you have, and so have I——

A. And the thought occurred to me at the time after investigation that this fifty cents would not be a proper divisor for the purpose of drawing an inference as to the two years extending from the year 1905 to the end of the year 1907. To explain, the reasons for that is this:

During the years 1898 to 1900 two years elapsed. Of those two years, six months of which the price was very much reduced, fifty cents. Now, during the remainder of each of those two years, the price remained in the one case at $1.15 and in the other case at $1. In the existing case where I have endeavored to make some inference, the price has been held as thoroughly as it could be since 1905 at $1. The consequence is that but a trifle over a year still remains
before reduced to eighty cents. That was the cause of my
2481 limitation to any question of prediction of two years. You
have, then, two analogous periods, the period between 1898
and 1900, of which one-half was at a reduced price and the period
between 1905 and 1907, at which it was possible that about one-half

might be at a reduced price, and that caused my rejection of the fifty cents, which would naturally occur at first to anyone taking up such a problem as this.

Q. Well, we may wish to apply your theory to a period beginning with the taking effect of this eighty-cent rate, and I consequently would like to know how much per capita the increase was in 1899 and 1900, assuming that the reduction was fifty cents—that is, from $1.15 to sixty-five cents for that period during which there was a reduction, and during which period there was inducement due to a reduction to an increase- consumption of gas? If it is 46.46 cubic feet per capita increase of consumption for each one cent reduction in price of gas, I ask you to take not thirty-three cents reduction, but fifty cents reduction, and see what the result is in that regard.

A. Will you allow me to explain how the matter which you are bringing up was very carefully canvassed by myself and my assistants?

Q. I don't think it is worth while. Really I think I understand your theory, and I merely am endeavoring to have you apply the actual reduction that was made and which induced this increased consumption of gas according to your statement instead of an average price, of which a good deal was at the regular rate and no reduction at all, and which therefore could have had no effect on the consumption of gas.

The MASTER: Answer the question directly, if you can, and if not say so. Any question of explanation, you know, Mr. Burr can bring out on redirect-examination.

2402 A. Lack of exact data as to the amount of outputs and of the populations on May 1st, 1899, and of similar exact data as to the amount of the outputs or sales of gas and of the population at that time renders it impossible to use the reduction from $1.15 to sixty-five cents.

Q. Well, will you take the population as it existed on January 1st, 1900, which is just about the middle of this year during which the sixty-five cent rate prevailed; and then take the fifty-cent reduction from $1.15 to be sixty-five cents which prevailed during that year and tell me how that would mean increase per capita for a cent of reduction?

A. As a mathematical computation for your purposes?

Q. Yes, certainly. It will take only a moment.

A. You desire to have me take the estimated population for 1898 and also the output for the sales of gas for 1898 and subtract——

Q. The increase in the sales of gas which you say was due to the reduction in price. You gave the amount in your direct testimony and stated the increase in sales of gas during those two years was so much and that it was due to a decrease in price.

A. I gave the increase in the sales of gas per capita.

Q. Yes, I mean per capita.

A. At nine hundred and twenty-nine cubic feet? You wish that divided by fifty cents?

The WITNESS: That is about 18.6 cubic feet, one-fiftieth.

Q. Is it not the 929 cubic feet that you divided by 33 to obtain 46.46?

A. Yes.

Q. How can you divide it by 50, which is only half as much more and just less than half of 46 as your quotient?

A. I may have made a mistake.

Q. I cannot see, professor, how you divide 929 by 33 and get your original 46.46 to begin with. According to my figuring, it would be a little less than 30.

2483 A. That was divided by 20, apparently divided in an error by 20. Will you allow me time to look at that carefully and take it up to-morrow or later on with you?

Q. Well, would it take more than a moment if you now divide it by 33 instead of 20, as you did, and just give me that result? Because I would a little prefer to put this consecutively, and then if there is any further correction, you can make it.

A. Mr. Mathewson, there has been a misprint there or a typographical error. It was not 929, it was 1533, which, divided by 33, gives you the required 46.46.

Q. Now you are sure that that is correct, are you, Professor?

A. Well, it appears to be.

Q. Where did you get the 929 which you have testified to?

A. If you multiply it by 20 you get 929.

Q. Is the 1533 which you now give the difference between the per capita consumption in two years, and if so, in what two years?

A. The per capita consumption in 1900 is given as 8,128, and the per capita consumption in 1898 is 6,595.

Q. That is on your chart?

A. On the chart, and the difference between those is 1,533. I will refigure it. It seems to be correct, with the exception that there is a typographical error or a printer's error, presumably a typographical error.

Q. Now, will you use the divisor of 50 in view of the reduction period having been sixty-five cents?

A. It seems to be about 30.6.

Q. About 30.6?

A. That is the result of dividing 1533 by 50.

Q. Now, if you apply that as a factor of increase instead of 46.46 for the year 1905 and 1906 it would show a less output of gas than you have heretofore estimated for 1907, would it not?

A. It would not show anything.

2484 Q. If you applied that factor in the same manner that you did the 46.46 it would produce a lower figure than the 15,000,000,000 and over feet which you have testified as for 1906?

A. As a mathematical calculation.

Q. Now, when you speak of the per capita consumption in 1899 on your chart as 7,363 cubic feet, do you mean for the entire year or at any particular date or an average time in that year?

A. That is an average on the year.

Q. How do you get the average of the year?

A. The estimated average population is 1,809,205, and the total gas sales appear to be 13,325,943,400 cubic feet.

Q. But you have taken the per capita consumption in 1898, and the gas war did not begin until 1899. Now, will you take the year 1899 and the year 1900 per capita consumption each year according to your chart, those being the two years in which the gas war prevailed, and let me know what the increase is between those two years in the per capita consumption?

A. It appears to be 762 cubic feet increase per capital consumption average.

Q. About one-half of what it was if you started with 1898, to wit, your 1,533 feet?

A. It makes 1,524 cubic feet, multiplied by two.

Q. Well, it is just about one-half of 1,533 cubic feet, is it not? Now, if you divide that by 50, what would be the increase per capita. shown for those two years?

A. If I divide 762 by 50?

Q. Yes.

A. If I divide 762 by 50 I obtain 15.2.

Q. Now, your estimate of the sales in 1907, and incidentally your estimate of the revenue of the company from sales in 1907, depends entirely on the accuracy or the justification for your estimate of increase per capita of 46.46 cubic feet for a reduction of one cent in the selling price of gas, doesn't it?

A. Yes, that is the basis.

2485 Q. Now, will you look at your chart, Professor, and tell us what, according to your chart, the increase was from the two years 1901 to 1903 in consumption per capita while the price of gas remained constant at $1.00?

A. The consumption per capita for 1903 appears to be 9,328. The consumption per capita for 1901 appears to be 8,135, and the increase appears to be 1,193 cubic feet.

Q. Pretty nearly 1,200 cubic feet in those two years with no reduction in price.

A. Yes.

Q. Now, in your testimony on page 2313, referring to the period which Mr. Addicks selected at the suggestion of the Gas Commission, that is 1894 to 1899, to compute the expenditures for renewals you say that that was a period in which the old works were tottering to their final collapse. What is your authority for that statement?

A. Mr. Bradley's statement.

Q. Will you point out in the record where Mr. Bradley says that most of the water gas apparatus has been built within the last five years.

A. The testimony of William H. Bradley, page 2018. It does not say here what proceeding that is in. In the middle of the page:

"No, sir, most of the water gas apparatus has been built within the last five years and is just as modern and up-todate as any we could contract for to-day."

Q. Quite right. Now point out the additional rates upon which you base your testimony on page 2313 that, "according to Mr. Bradley's testimony, they did collapse about 1900 and were replaced by the latest type of water gas plants." Where does he say that they did collapse about 1900 or that they were tottering on the verge of collapse in 1900?

A. He did not say so. I said so.

2486 Q. But you say "according to Mr. Bradley's testimony they did collapse about 1900." Now, where is Mr. Bradley's testimony that they did collapse about 1900?

A. Perhaps I did not use the English language as precisely as I would had I known the point would be raised.

Mr. **Burr**: I call attention to the fact that on page 2313 Dr. Marks quoted the exact language of Mr. Bradley as he has read it now, and has said according to Mr. Bradley's testimony that was his inference, that it did collapse about 1900.

The **Master**: That is the point, whether it is his inference or whether it is according to Mr. Bradley's testimony.

Mr. **Mathewson**: Yes.

Mr. **Burr**: The presumption is they would not have been rebuilt if they had not collapsed.

Q. Did Mr. Bradley testify at any point in this record that you can point out that the apparatus of the company or any of it did collapse about 1900?

A. No; that is my own inference from his testimony regarding the rebuilding of the works.

Q. That shows the futility of making such inferences, Professor. Don't you remember Mr. Bradley testifying that what he referred to was the generating apparatus, that some of the generating apparatus in some of the plants was replaced with newer type apparatus, was not that the whole effect of Mr. Bradley's testimony as you understand it?

A. I have just quoted what he said.

Q. Have you quoted all of his testimony? I ask you if you do not remember his testimony that certain of the generating apparatus was replaced in some of the plants about that time?

2487 A. I have a general impression that he made that statement, but I specifically looked up his answer and quoted it here so as to avoid any possibility of impression.

Q. Do you remember his testimony that certain of the apparatus was what was replaced and not the entire working plant, from 1900 on?

A. No, I do not, beyond what I have quoted to you.

Q. Do you think that these plants could have been tottering on the verge of collapse and still deliver gas in the quantities that it is shown that they did deliver in 1900, or up to that time, immediately before they were replaced?

A. As a very young man and engineer I had seen the inside of a good many of these old works and I know that many of them were not in very good condition.

Q. Some of the Consolidated Gas Company's works?

A. If I remember rightly it was the Manhattan at the time.

Q. How long ago was that?

A. Oh, that was 30 years ago, 25 or 30 years ago.

Q. That was a coal gas plant, wasn't it?

A. Yes. at that time.

Q. And that coal gas plant at 18th Street has been taken by the

City and was operating up to the time it was taken, efficiently. You have heard testimony to that effect?

A. I have heard it, yes.

Q. And the other one was 14th Street and it is still operating. You understand that, do you?

A. Yes.

Q. Do you understand that any of the manufacturing plants of the Consolidated Gas Company have been changed from coal gas to water gas since the consolidation in 1884?

A. I have had no opportunity to examine the works or to inquire into their history.

Q. Have you any information to that effect?

A. To what effect?

2488 Q. To the effect that any of them have been changed from coal to water gas since 1884?

A. I am not familiar with the details.

Q. Did you not in making your criticisms upon the repairs and replacements which Mr. Addicks took for the period of 1894 to 1899, inclusive, refer to or have in mind a change from coal gas to water gas plants in your suggestion that the repairs thereafter should be less?

A. I cannot locate Mr. Bradley's testimony. I have an impression on my mind, however, that he did state, and I think if I had time I could find it, that since 1884 there had been a great many alterations in the works, and I am not at all sure that he did not add in the direction of increasing the water gas output rather than the coal gas. I think that was the general impression.

Q. But you do not understand that he decreased the coal gas output at all, do you, since 1884?

A. No, I didn't go that far into it.

Q. Now, as a matter of fact, don't you remember his testifying that some of these water gas apparatuses were not substituted until 1903 and 1904 instead of 1900?

A. Mr. Mathewson this is simply a test of my memory of what Mr. Bradley said——

Q. Yes.

A. If you will kindly indicate to me these points—it has no bearing on the technical evidence which I am supposed to give here.

Q. I rather think it has Professor. I think it is a test both of your memory and of the accuracy of your statements and the basis upon which you criticise the taking of the period for renewals and repairs.

Mr. Burr: Would it not be better and would we not proceed a little more speedily if you called his attention to some specific testimony?

Mr. Mathewson: I do not think so. I have asked the witness if he does not recall Mr. Bradley's testimony that some of the 2489 water gas apparatus was installed in 1903 and 1904 instead of 1900 as the witness himself has stated in his direct testimony.

The Witness: I do not recall making a statement such as you have made. If you will kindly refer me to the point in my own evidence——

Q. I refer to your own evidence "According to Mr. Bradley's testimony they did collapse in 1900 and were replaced by the latest type of water gas plant."

A. Referring to what page?

Q. The same testimony that I quoted your statement that according to Mr. Bradley they did collapse in 1900 and were replaced by the latest type of water gas plant.

A. Page 2313?

Q. It would follow, then, that if they collapsed about 1900 and were not replaced until 1903 and 1904 that the company was without an operating plant during that period to that extent?

A. I said about 1900.

Q. Now, if the water gas apparatus which was installed from 1900 to 1905 was in substitution for other water gas apparatus, repairs would still continue, would they not, at substantially the same rate in the future?

A. Not necessarily.

Q. Unless the new apparatus became worn, and, indeed, at the outset repairs would be required from time to time, would they not?

A. Repairs are always required upon all machinery.

Q. And are the repairs and replacements greater in a coal gas plant than in a water gas plant?

A. That is so general a question it cannot be answered. A specific coal gas plant or a specific water gas plant might be compared, but you cannot generalize.

Q. Well, take water gas plants and coal gas plants in the City of New York operated by the same officials and with the same efficiency and care, is it not a fact that a coal gas plant, as a rule, requires a greater expenditure in repairs than a water gas plant? 2490

A. I have had no opportunity to examine the New York gas plants and therefore cannot answer your question.

Q. Take it in the same locality and under similar conditions, is not that true?

A. No answer can be made in the way of generalization.

Q. Do you mean that you don't know or that it is not possible to state generally that a coal gas plant, as a rule and in similar circumstances, requires more repairs than a water gas plant?

A. I know that it has been very frequently stated by gentlemen who have given evidence here that such is the case.

Q. Have you any doubt of it?

A. Yes.

Q. Then you don't know whether when the Astoria plant is in operation this fall, being a coal gas plant, and when the output of the company shows a larger proportion of coal gas than it has for some time in the past, a greater amount of repairs would naturally be required or not, do you?

A. Using the word "know" in its proper sense, I do not.

Q. Have you any opinion on the subject?

A. I have.

Mr. Burr: There is the testimony of Mr. Bradley in regard to the change (handing book to the witness).

Q. Do you think that the coal gas plant would require more repairs than a water gas plant of the same capacity?

A. Recalling instances that come to my knowledge, I have knowledge where coal gas plants have required more repairs, more costly repairs, than the water gas plants. I don't know whether the reverse may or may not have occurred in other cases.

Q. Now referring to your testimony at page 2308, where you refer to the repairs and renewals, you were asked this question and made this answer:

2491 "Q. What do you deduce from those statements? A. First, that taking an average of repairs from a number of coal gas plants between the years 1884 and 1900, in connection with the repairs to the modern water gas plants from 1900 to 1906, is a very adroit method of padding the apparent cost of gas by using the higher repairs of old-fashioned smaller gas plants for the new and larger water gas plants."

Don't you know that the same coal gas plants are in operation and have been all the time since 1884 to date?

A. Do you mean in the Consolidated Gas Company?

Q. Yes, and that none of the coal gas plants have been substituted with water gas plants?

A. I have been denied all information on that point.

Q. Then what is your basis for the statement to which I have just called your attention on page 2308?

A. Very easily stated. It is a matter of age and old-fashioned works against new and much perfected works.

Q. And repairs, so far as the coal gas plants are concerned, would remain substantially uniform, would they not, having relation to their capacity?

A. In what case do you refer?

Q. I refer to the case of the coal gas plants of the Consolidated Gas Company. Assuming them to have been cared for equally well during the entire period?

A. Without an examination, my opinion on that subject would be of no value.

Q. Then, taking the water gas plants, assuming that there was in existence efficient machinery producing up to the year 1900, and later, water gas in the quantities which are shown in the evidence, would the substitution of other water gas apparatus for the purpose, as Mr. Bradley testified, of being able to use cheaper oil, reduce very largely the amount that would be required for repairs in time to make on the water gas plants? 2492

A. On page 2025 of the testimony, Mr. Bradley makes this statement:

"Q. Since 1904 what improvements have you made in the water gas plants that would enable you to reduce the cost of production?

A. Changed the entire method of production both at 21st Street and 44th Street and 99th Street.

Q. Was that not done prior to your testifying before the Stevens Committee? A. Part of it was."

Q. That doesn't answer my question as to whether repairs, and in general similar repairs, would not be needed upon water gas apparatus of the class which he describes as was required upon water gas apparatus theretofore, assuming that the previous apparatus was working efficiently?

A. It is obvious that repairs are always needed on all manufacturing apparatus used in the gas making business. As to the amount required, it is necessary to make a careful investigation either in person or by those in whose skill you have confidence.

Q. And is it not true that where you substitute machinery for hand labor, for instance, so far as possible in apparatus, that you increase the amount required for repairs, because you have more machinery, but at the same time you reduce the amount required for payroll?

A. That is the object of introducing the machinery.

Q. Now, in reference to Dr. Humphreys' testimony, you have referred to him as "blindly accepting the statements of the company." Did you hear his testimony that he himself tested the accounts of the company and examined items and found that the division between replacements on the one hand and new business on
2493 the other had been very carefully made?

A. I have a general impression that he made such a statement, but I also recall the fact that he stated he had not examined the vouchers or the accounts of the company as to the cost of gas.

Q. But you do recall the statement to which I have called your attention, don't you?

A. I have a general— If you can refer me to it.

Q. I asked you whether you recollected it?

A. I beg your pardon?

Q. I asked you whether you recollected it?

A. I do not specifically recollect the exact language. That was the impression, I think, that he gave.

Q. Let us take up the question of the use of oil. You have presented here a chart purporting to show the average illuminating power shown by the city's tests for the gas of this company for the calendar year 1905, and you show about 24 candles average for the last six months. Have you a record showing the specific examinations upon which your average was made up?

A. That is in the possession of Chief Engineer Charles F. Lacombe, chief of light and power, and was by him furnished to my assistants who made up this statement from the affidavits given day by day or at regular intervals by Chief Gas Examiner E. G. Love.

Q. Did you examine those detailed tests yourself or a record of the tests, individual tests?

A. I did, quite a number of them and explained the method.

Q. Did you not find that at some times even with this average candle power, that the candle power recorded at some point in the city tests would fall in the main to 22 candles or very close to it?

A. I noticed occasional irregularities in the gas, which occur.

Q. Did you not find that the test showed a candle power in some cases of 22 candles or a very small fraction over it?

A. Yes, I think so; I think it is shown there.

2494 Q. Did you find any test in which in spite of this average, the candle power actually fell a trifle under 22 candles?

A. Will you k-ndly let me look at the tabulation, if you please.

(Paper handed witness.)

The WITNESS: You are referring to the last six months of 1905?

Q. Yes.

A. No, I do not in the last six months of 1905.

Q. You did not find any individual case, any average for a month, where the tests of Prof. Love showed little, if any, over 22 candles?

A. There were a few cases which I have already stated. I can get the affidavits from Dr. Love and look the whole matter up if you wish.

Mr. BURR: We shall produce Dr. Love.

Q. You answer so many more questions than I ask that it takes a good deal of time. I am merely asking you whether with this average it is not the fact that in many cases tests by Prof. Love showed that the candle power in the mains had fallen to very close to 22 candles in individual instances?

A. In relatively very few cases has that occurred.

Q. In any case did you find that they fell below 22 candles?

A. If I did, it was very small. There was a very large number of observations there which we had to go through, and it was inconsiderable.

Q. And you understand that there is a thousand dollars penalty fixed by the statute for each time that the candle power in any one of our five stations on any day is found to fall below 22 candles.

Mr. BURR: Objected to as immaterial and irrelevant.

The MASTER: I will allow it.

Mr. BURR: Exception.

2495 A. I have heard it so stated.

Q. Do you know any other city in which so great a penalty as $1,000 for failure to keep up the candle power is fixed for each daily inspection?

A. I do not.

Q. Do you know of any reason why Chief Engineer Bradley should use more oil than he considered necessary to keep the candle power up?

A. I don't know what his instructions are.

Q. No reason occurs to you, does it, Professor, why he should use more oil and the company should spend more money than is necessary to produce their gas?

A. I say I do not know what his instructions are. Anything I might say would be a mere guess.

Q. Do you mean to say without experience in the operation of a gas plant in New York City or in any other metropolitan community in the East that it is possible to maintain an average candle power of only 22½ candles monthly record and at the same time at all times keep the candle power on test by the city a mile from the works above 22 candles?

A. There are certain periods of——

Q. I asked you a direct question. Will you not give me a direct answer for once.

A. Yes.

Q. That is your view, in spite of the testimony of Mr. Bradley or Dr. Humphreys or any one else who has had experience in operating plants constantly?

A. It is.

Q. Have you ever used in your experience the quality of oil which this company uses and requires, 34 standard?

A. Beaumé?

Q. Yes.

A. I have used a good — of oil, I don't know that it was 34 Beaumé.

Q. You have also referred to the price which the company pays for its oil, and you have cited various other gas companies in the State of New York, which you say you took from Brown's 2496 Directory, and have said that the average which they pay for oil is 3.55 cents. Why didn't you take all the municipalities in the State of New York which are producing gas, instead of omitting twelve which appear in Brown's Directory in selecting those which you did take?

A. It is well known in business that anything purchased in wholesale quantities and in gross is expected at a considerably lower price than anything which is purchased in very or relatively small quantities. I picked out fourteen instances in which this obvious violation of well-known precedents had occurred and in which the companies were small relatively as nothing and yet appeared from Brown's Directory to be obtaining their oil at a less price.

Q. If there is but one producer who produces the amount of oil and with the certainty and reliability which this company requires you think they could get their oil cheaper than a company which produces so little oil that it could get it in a half dozen different directions?

A. Certainly if that company gave them a square deal.

Q. It is not a question of a square deal. When one has a product which he desires to sell and a purchaser of that product must deal with that seller alone is not he put at a disadvantage as compared with another man who requires so little of the product that he can get it from many different dealers and reliable dealers? Now I ask you to give me a direct answer to that question.

A. Without a careful investigation taking the quantities into consideration I should say that anybody that paid more than the lowest market price that they could learn was doing very bad business indeed and as for the theoretical condition which you have stated, that remains to be shown whether it does or does not exist.

Q. It has been testified to exist. Assuming, now, that it 2497 does exist, will you answer my question, or have you given the best answer you can?

Mr. **Burr**: Well it is claimed here that the Consolidated Gas Company is at the mercy of the one company that supplies it with oil, the Standard Oil Company.

Mr. **Mathewson**: I shall not characterize it. I call your attention to the testimony, that the Standard Oil Company is the only company that produces the quantity of oil desired by the Consolidated Gas Company, so that it is able to furnish it. We are in that unfortunate position, if you please to put it so.

The **Witness**: That is about the best answer that I can give you.

Q. So that if a company is confined to a single producer, no other producer is able to fulfill its demands, you think they would be still in a better position than a smaller company which required but a small amount and who get that amount from half a dozen other dealers?

A. If fairly treated, yes.

Q. Now, have you read Mr. Addick's affidavit in rebuttal, and did you note his statement that while the municipalities which you chose showed an average of 3.65 cents for oil in the State of New York, those which you had omitted, to wit, Cooperstown, Fort Plain, Grandville, Huntington, Patchogue, Fort Henry, Port Jervis, Sag Harbor, Saratoga, Suffern, Warsaw and Watertown, showed an average price of oil to be 4.12 cents up to 7 cents a gallon or an average of 5.035 cents per gallon?

A. I have.

Q. And have you read his further statement that the average price of oil for all the twenty-six companies, including those you did take and those you did not, was 4.25 as against 4.08 paid by the 2498 Consolidated Gas Company during the same period?

A. I have.

Q. Have you any doubt of the accuracy of that statement, or have you checked it?

A. I have not checked it.

Q. Do you know whether that statement is correct or not?

A. I see no reason to doubt the general accuracy of that statement.

Q. If that statement is correct, then the price paid by the Consolidated Gas Company for oil within that period, 4.08 cents, was considerably less than the average price paid by all the other companies in the State of New York, of 4.25 cents, is not that true?

A. That is true.

Q. Now you have testified that a reserve or insurance fund which is allowed in England and which you have said should be allowed in this country, in your book, should not be allowed to the Consolidated Gas Company for the reason that it has spent its surplus in acquiring control of other companies and establishing a monopoly. That is page 2323 of your testimony. I would like to have you point out any testimony where it appears that the surplus of the Consolidated Gas Company has been invested in the securities of other companies.

A. State's Exhibit B, page 382A, statement of securities and obligations of other companies acquired, par value.

Q. Oh, yes, that is quite right, we have acquired securities of that par value, but point out to me where there is any testimony that our surplus fund has been invested in those securities. Don't you recall the testimony that the securities of the Consolidated Gas Company in the shape of stock were issued for the purpose of acquiring securities of these other companies?

A. I recall such a statement.

2499 Q. Now, will you point out any statement or any evidence here upon which you base your statement that the surplus of the Consolidated Gas Company, earned in its gas business, was invested in acquiring the securities of other companies, for a monopoly or for any other purpose?

A. The word "surplus" was used as indicating the investment of funds not actually required for the operation of their proper gas business.

Q. What funds, funds that they acquired by the issue of new securities for the purpose of purchasing securities of other companies? Do you refer to that as a surplus?

A. I refer more particularly to the apparent value of this exhibit of $100,877,059.56; to the book value of $53,041,134.52, and to a statement of the return on the investment amounting to $1,018,712.28; in addition to which the Astoria Company is charged with $7,135,000 and the National Coal & Coke Company included, and a book value is given of the purchases of the securities as $7,060,000, making a total of all companies of $108,012,059.56 apparent par value and a book charge of $60,101,134.52.

Q. Now, Doctor, let me recall your mind to what we were considering. You have said that a surplus or reserve fund is ordinarily allowed to be accumulated by a gas company in its gas business. You then go on to say in substance that in the case of the Consolidated Gas Company that should not be allowed now on the cost of gas. And you were asked this question, at page 2322:

"Q. Now, Doctor, what have you to say in regard to the item charged here on Exhibit 94 for insurance of reserve funds? Is that a proper charge, or are these proper subjects for special allowance if required or demanded by a company which has confessedly, as in the case of the Consolidated Gas Company, made for a long 2500 term of years the profits that the Consolidated Gas Company has? A. It is obvious that the surplus applicable to both these funds would have been more than ample, had not the Consolidated Gas Company gone out of its province as a gas manufacturer in the endeavor to obtain the monopoly of all forms of lighting in the Island of Manhattan and Greater New York."

And a little later:

"Q. What is the answer? A. It is not under existing conditions.

"Q. Why. A. Because the Consolidated Gas Company appear to have spent their surplus in an endeavor to obtain control of all forms of lighting on the Island of Manhattan."

Now, did you not refer in that answer and did you not understand the question to refer to the surplus which the company was making in the operation of its gas business?

A. I referred to the vast sums——

Q. Can you not give me an answer to that question?

A. I did not.

Q. Then what earthly pertinence did it have to the subject under consideration, which was whether there should be an allowance of five cents per thousand feet or something else on account of a reserve fund for the Consolidated Gas Company in connection with its gas business?

A. I had the knowledge at the time that these sums were in possession and control yielding something over a million dollars, according to their own statement, to the Consolidated Gas Company, outside securities, and the statement was of a value approximating $100,000,000. Why should a company want to go on piling 2501 up a surplus which had such vast profitable resources back of it?

Q. Yes, and did you figure out that the amount that the company received on the securities of other companies, this $1,000,000 or so, was only about two per cent. of the cost of those securities to the company? That would not represent a very large surplus, would it, when you applied — to that investment?

A. I know the real profits of gas and electric works, and particularly of electricity; I know what is being made.

Q. We are not talking about the return that the Consolidated Gas Company received from these other companies, which figure you yourself used. Now I want to know where the surplus of the Consolidated Gas Company, earned in its gas business, which we are treating with here entirely separately from its investment in securities of other companies, was invested in securities of other companies, if it was invested at all. I would like to have you point it out?

A. Taking State's Exhibit B——

Q. You certainly do not mean that the income that the Consolidated Gas Company has received from the securities of other companies is the surplus which is invested in the securities of other companies, do you?

A. Will you repeat the question.

(Question repeated by stenographer.)

Q. You do not refer to that when you say surplus invested in the securities of other companies, do you?

A. I do not understand the first question clearly. May I ask to have it in a somewhat different shape?

Mr. **Burr**: Will the stenographer read it?

(Question read by stenographer.)

The **Witness**: Is the income which is received from the 2502 surplus invested in other companies, is the surplus which is invested in other companies?

Mr. **Burr**: That is about it.

Q. No, it is quite clear, if you will refer to your previous testimony. You have referred to a million dollars which you say was received by the Consolidated Gas Company from its investments in securities of other companies, received from those companies by way of dividend, and I am asking whether you referred to that fund when you spoke of the surplus of the Consolidated Gas Company, which was invested in the securities of other companies?

A. Will you mention the sum, if you please? Is it the $1,018,712.28?

Q. I refer to the sum of about that amount which you yourself introduced a few moments ago.

A. I referred to that sum as being available for the needs of the Consolidated Gas Company, but I meant from my own personal knowledge of the profits of electric lighting and gas, a much larger sum, which is very carefully hidden by some method, which is earned by these various companies on their securities.

By Mr. **Burr**:

Q. By the various electric light companies?
A. By the various electric light companies.

By Mr. **Mathewson**:

Q. Well, then that is not the profits of the Consolidated Gas Company covering a long term of years which is invested in the securities of other companies and to which you referred when you made that kind of a statement, is it?

2503 A. It is impossible to answer questions without access to the books.

Q. I am trying to find out what you mean and what you referred to in your testimony and nothing further. I read from page 2323 as follows:

"By the Master:

"Q. What you mean by that is that the surplus has been expended "in the purchase of securities of other companies? A. Yes, sir."

Now, what surplus did you refer to there which has been invested in the securities of other companies? Didn't you refer to the surplus which the Consolidated Gas Company had made in its gas business, because it had no other business until it invested in the securities of other companies?

A. I referred to its visible possessions, State's Exhibit B, page 382.

Q. I repeat my question. When you replied to the Master's question, "What you mean by that is that the surplus has been expended in the purchase of securities of other companies," and you answered "yes, sir," to what surplus did you refer as having been invested by the Consolidated Gas Company in the securities of other companies?

A. I referred to State's Exhibit B, page 382, given by the Consolidated Gas Company and amounting apparently to something over sixty millions.

Mr. **Mathewson**: I would like to have the Master look at this if he does not know what it is.

The **Master**: I know what it is.

Q. Don't you know that State's Exhibit B., 382A, is not a statement of surplus at all and that those securities shown there were purchased by some other funds?

A. I have not had access to the books.

2504 Q. When you state that those securities had been purchased out of the surplus, as you did in substance in reply to the Master, by the use of what surplus did you understand they were purchased?

A. By a surplus not required for the operation and the legitimate business of the Consolidated Gas Company.

Q. Then you referred to the surplus accumulated by the Consolidated Gas Company in its operations before it purchased these securities, didn't you?

A. Without access to the books I cannot answer that.

Q. What did you refer to?

A. To the visible results given in State's Exhibit B.

Mr. **Mathewson**: Mr. Master, I think the witness should answer that question.

The **Master**: You can answer that question.

Mr. **Mathewson**: Mr. Stenographer, repeat the question.

The **Stenographer** (reading): Q. When you said that those securities had been purchased out of the surplus, as you did in substance in reply to the Master, by the use of what surplus did you understand they were purchased? A. In using the word surplus I referred to the surplus possessions of the Consolidated Gas Company over and above what was required in its legitimate functions as a producer and vendor of gas.

Q. Did you not refer to the surplus which the company had accumulated in its gas business before it purchased these securities when you said that it used its surplus in the purchase of securities of other companies?

Mr. **Burr**: That is the fourth time that question has been asked and he has now given an answer showing exactly what he meant.

2505 Mr. **Mathewson**: And I have been unable to get an answer after asking it four times.

The **Master**: The witness stated very plainly on page 2323: "Because the Consolidated Gas Company appeared to have spent "their surplus in an endeavor to obtain control of all forms of light"ing on the Island of Manhattan."

Now it is a fair question on cross-examination to find out on what he bases that statement. He bases, it according to his answer here now, on this State's Exhibit B, but that does not go to the point. The counsel is entitled to cross examine——

Mr. **Burr**: I have not the slightest objection to the fullest examination, only if he asks the question four times and the answer is given now, he should proceed to another question. But that question has been asked four times.

The **Master**: Either the witness does not understand, else he does not want to answer, else he does not know.

Mr. **Burr**: It is quite apparent here and on the record that the Consolidated Gas Company has acquired the New Amsterdam Company and the electric light companies.

Mr. **Mathewson**: No doubt about that. That is not in dispute.

The **Witness**: Mr. Master, I have answered that just as clear as I am able to. Will you kindly read my last reply.

Mr. **Mathewson**: Read my last question before you read his reply.

The **Stenographer** (reading): Did you not refer to the surplus which the company had accumulated in its gas business before it purchased these securities, when you said that it used its surplus in the purchase of securities of other companies. 2503

The **Witness**: Now will you read my answer?

The **Stenographer** (reading): In using the word "surplus" I referred to the surplus possessions of the Consolidated Gas Company over and above what was required in its legitimate functions as a purchaser and vendor of gas.

The **Witness**: I shall be glad to answer any further questions. I have nothing to keep back. I wish to meet it frankly and fairly.

Mr. **Mathewson**: I repeat the question and ask you to give me a direct answer.

The **Master**: Well, the witness says in effect he cannot answer it any better than he has. That seems to end it. Is that not the case, Doctor.

The **Witness**: That's it.

Q. Well, Doctor, there was a time about 1900, we will assume, when the Consolidated Gas Company owned no securities of other companies. It then proceeded to purchase the securities of other companies and you have testified that it used its surplus to acquire the securities of other companies. Now, not having been in any business except the gas business up to that time, did you not refer to the surplus that the Company had accumulated in the conduct of its gas business since 1884 down to that time when you used the term "surplus."

A. Had the company accumulated a surplus at that time?

Q. I am not on the witness stand. I am asking you to define what you mean, and I have asked a question that I think is susceptible of a fair and direct answer.

2507 A. And my reply is that when I used the word "surplus" I referred to the visible evidence of great and extraordinary possessions outside of the gas business.

Q. No, you said it used its surplus to acquire those securities and interests in other companies. Now, I am asking if the surplus to which you referred was not the surplus that it had accumulated in its gas business before it acquired the securities of other companies? I think I am entitled to a fair answer, and won't you give me that answer; yes or no?

A. I am not aware that it has accumulated or has not accumulated a surplus.

Q. Then you don't know whether it had any surplus or not to expend in securities of other companies.

A. I asked the question and received no reply.

Q. But you did not ask me the question before you testified that it invested its surplus in the securities of other companies.

A. I referred to the Exhibit, State's Exhibit B.

Q. Those are the best answers you can give, are they?

A. That's it.

Q. Now we will take the gas business of this company and forget it owns any securities of other companies, it being conceded that that is not in the issue before this Master at all. We will take the gas business of the Consolidated Gas Company. Did you not say in your book that a company was entitled to a reserve or contingent fund of about 5 per cent. on the value of its assets?

A. I did so say.

Q. And didn't you say that the Consolidated Gas Company was not entitled to that now because it had invested its surplus in the securities of other companies, and if that be true what was the pertinence of your observation if you did not refer to the surplus of the Consolidated Gas Company which was acquired in the conduct of its gas business?

A. I did not say that the Consolidated Gas Company was not entitled to a surplus. I said it was not entitled to an allowance
2508 on the cost of gas of three cents claimed by Addicks or five
cents claimed by Humphreys, or ten cents claimed by everybody.

Q. And if it had not acquired these securities of other companies, would it have been entitled to that five per cent. the same as other gas companies, according to your book?

A. Certainly not. It is simply a case of after paying a proper dividend accrued upon setting aside from profits a contingent or reserve or insurance fund and also a reserve fund for lean years.

Q. But isn't the Consolidated Gas Company entitled to set aside a certain number of cents per thousand or a certain percentage upon its property for a reserve or contingent or final renewal fund if companies in general are so entitled as you state in your book?

A. What is the peculiar situation of the Consolidated Gas Company that deprives it of that right?

A. I have not stated in my book that the companies are entitled to set aside a certain number of cents on every thousand cubic feet of gas. I have not made such a statement.

Q. Haven't you made a statement in substance that they are entitled to a surplus until it amounts to a certain percentage of their capital?

A. I have stated that it is the custom in England to set aside a surplus from the clear profits amounting, if I remember all right, *of* 5 per cent. and in the case of the reserve fund amounting to about 10 per cent. of the capitalization or structural value of the works.

Q. Both 5 per cent. and 10 per cent. for those two purposes?

A. Both 5 per cent. and 10 per cent. I don't know the details. I know it is a reasonable sum.

Q. But you have drawn in the English system and the English accounting as a very desirable thing to be following in America. Now, why is not the Consolidated Gas Company entitled to
2509 set aside a like fund until its surplus fund reaches say 10 per per cent. of its capital?

A. Under proper capitalization I would ardently advocate such an arrangeemnt as to give the Consolidated Gas Company both an insurance and a reserve fund under the English system.

Q. We have nothing to do with the paper capital of these companies. We are determining the value of its assets and the amount which should be allowed for the cost of gas and we are only claiming a return upon that and its investment in the gas business. That being the case, is not the Consolidated Gas Company entitled, like the English companies, to an allowance for a reserve or contingent or final renewal fund of the same amount and up to a certain point?

A. Surely, out of the clear profits.

Q. What would that be? How much should they allow?

A. That would require very careful study any very impartial discussion on the part of all parties at interest.

Q. You do not claim then that the surplus of the Consolidated Gas Company which it now possesses and which is due to the result of the conduct of the gas business, is invested in the securities of other companies, as I understand it?

A. I really do not know.

At 1.05 P. M. a recess is taken until 2.15 P. M.

2510

Afternoon Session.

William D. Marks resumed the stand.

Cross-examination by Mr. Mathewson (continued):

The Witness: May I make a little further explanation in regard to the meaning of the word "surplus" as I used it in my testimony?

The Master: Unless Mr. Mathewson wants it I think you had better wait until Mr. Burr re-examines, unless Mr. Mathewson does not object to its being done now.

Mr. Burr: You will be given an opportunity to explain all things necessary——

The Witness: Well——

Mr. Burr: If there is any misunderstanding with regard to your use of the word "surplus," you might explain it now, if you think there has been a misunderstanding.

The Witness: Shall I go on?

The Master: Yes, there is no objection.

The Witness: In the use of the word "surplus" I may not have stated as clearly as I might have stated, that I meant surplus capital and surplus earnings both.

By Mr. Mathewson:

Q. You said you have been an accountant, Doctor. Is it customary in accounting to refer to moneys or property received in exchange for capital stock issued as surplus?

2511 A. Referring to the accounts of large corporations frequently published you will observe that they state that their surplus is thus and so and frequently invested in stocks, bonds and other securities, frequently enumerating those stocks, bonds and other securities.

Q. I ask you whether when you issue capital stock of a corporation or issue debentures in a corporation and receive therefor cash or value, that is called surplus from an accountant's standpoint or whether it is called capital?

A. The question——

Q. Now, can not you answer yes or no.

A. The question is not distinct. It depends on the use which is made of the cash or capital to which you have referred as to whether it would be called surplus or simply remain as working capital.

Q. Is not surplus in the accountants' view or in their method of treatment the balance of assets beyond outstanding stock and securities?

A. In financial institutions such as banks which have had their stock paid in full an accountant would use the word "surplus" for all the accumulations over and above par value of their stock. For instance, it has become the custom——

Q. I do not care to have you give any illustrations. My question is a fair one and you can answer it directly, I think. I am asking you whether surplus from the standpoint of an accountant is not the balance of assets above capital and securities outstanding?

A. It is, with this qualification, that in the case of many corporations more than the par value of the stock is charged at the outset and that I have known to be carried to surplus at the very beginning.

Q. But that is assets above the par of the stock and securities outstanding, isn't it?

A. You might put it that way, yes.

Q. Well, it is the fact, isn't it, in that case?

A. Yes.

2512 Q. Now, that you say that you include both earnings and funds derived by the companies from other sources in the term "surplus" and without discussing the accuracy of this designation will you point out to me where the surplus, so far as it is earnings of the Consolidated Gas Company, has been invested in the securities of other companies?

A. As before stated I have no access to your accounts.

Q. Then why did you state that?

A. Because my knowledge of the business, both the profits in gas and electricity——

Q. Does the fact that profits are made in gas and electricity prove that the surplus of a company which represents earnings beyond distribution to stockholders, is invested in the securities of other companies?

A. That again is a question which can only be answered in particular cases. There is no generalization possible.

Q. Are you familiar with the exhibits in this case? I think you said you had been over everything, didn't you?

A. I tried to.

Q. Will you look at Exhibit No. 80 and see if it does not appear that the surplus of this company, so far as it comes from earnings, is invested in its gas business and not in the securities of other companies that appear below, if that is a true statement.

A. (No answer.)

Q. You notice the amount invested in the securities of other companies appears to have been derived from the issue of stocks, do you not?

A. I see a statement here that the surplus is placed at $1,546,697.38, Complainant's Exhibit 80, October 31, 1905.

Q. And so far as that exhibit shows, or if that exhibit is correct, then the surplus is invested not in securities of other companies which are tabulated at the foot, but in its gas business, isn't it?

2513 A. Wait a minute. This does not appear to be a transcript from the book of a precise nature but is a statement of assets and liabilities in a more concise form, showing an exact two millions, and an exact one million, as the result of the subtraction of two accounts, which is a very unusual and extraordinary thing in accountants' results.

Q. Whether it is new or extraordinary or not, it is testified to be correct, and if it is correct, the surplus is not invested in the securities of other companies, is it?

A. Apparently not in that case of the $1,546,697.38.

Q. Now, when you speak of English allowances of both an insurance fund and reserve fund, isn't it true that the companies are allowed to charge for gas enough to cover the standard dividend and also the operating cost of gas and also the amount properly chargeable to these two funds?

A. There is a standard rate of dividend fixed—I may be wrong in this matter—by a commission which, I think, is drawn from a Board of Trade——

Q. (Interrupting.) I do not think that is important——

A. (Interrupting.) I don't know that this Commission takes into consideration the surplus for either the insurance fund or the reserve except in a general way as providing a margin on which all business has to come and go according to the vicissitudes that occur from year to year.

Q. But the point I am asking is this: Is it not the fact that this reserve fund and insurance fund are not taken out of the standard rate of dividend allowed but a price is permitted to be charged for the gas large enough to cover the operating cost of gas, to cover the amount properly chargeable to these two funds, and an amount sufficient to pay the dividend beyond. That is a fair statement, isn't it?

A. Both of these funds are limited in their amount not to a term of years, and therefore no arrangement can be made which would in perpetuity allow a constant surplus for the purpose of creating these——

2514 Q. Of course not, and I therefore use the "amount properly applicable" to these two funds but the amount allowed to be charged for gas is sufficient to cover the operating cost of making and distributing the gas, plus the amount properly allowable for the two funds in any year, plus an amount sufficient to pay the standard dividend of the company, isn't that so?

A. The sliding scale is attached to the standard rate of dividend and in the sliding scale, recalling roughly, every ¼ of a one per cent. dividend is added for every penny or two cents reduction in the price of gas, at least in the case of some of the companies; and the reverse is true where the price of gas is raised, the standard rate of dividend is reduced in the case of some companies; and therefore the question of the surplus necessary for the insurance fund and for the reserve fund is left largely in the hands of the managers and directors of the English companies.

Q. Precisely. So that the point is this: A company may pay more than the standard dividend if it reduces the price of gas below the rate which may be called the standard rate fixed?

A. Yes.

Q. And whatever it does within the discretion of the company it may charge for gas a sufficient amount to cover the operating cost of the gas, an amount to cover the proper sum chargeable or allowable to these funds in any year, and an amount sufficient to pay the dividends to which they are entitled under the terms of the statute?

A. If it so desires.

Q. Yes, exactly.

A. Under the sliding scale.

Q. In other words the amount of the insurance and reserve fund does not come out of the dividend which is allowed under the statute, but is in addition to it and included in the price of gas in addition to it?

A. That would be true unless the price of gas was raised
2515 and the dividend reduced for the purpose of creation of surplus funds for the insurance fund and for the reserve fund.

Q. Yes, but in the ordinary case my statement is accurate, is it not?

A. That I cannot answer.

Q. Now, in reference to the cost of plant, cost of operation and your method of deduction, I want to ask you whether this is a correct quotation from your books:

"**Practical figures required.** No mere theory as to the cost of the plant and of its operation is of any value. The actual figures, deduced from the cash costs of an operative plant of sufficient size to produce light and power in quantity required for a city's use, must be obtained."

A. That is written with regard to electrical stations if I remember all right, and is accurately true.

Q. And isn't it equally true of gas stations?

A. I should say it was.

Q. And throughout your work, without calling your attention to many instances, do you not recognize, or is it not based upon the right to compute 15 per cent. or thereabouts to cover dividend and what you may call reserve or depreciation, 15 per cent. computed on the structural value of the entire plant?

A. In the case of both gas, electricity and electric railways, of which I have made a careful study I should say that in a rude way adaptable to the uses of an active manager—for such individuals the book was written—that if you take the actual cash cost of raw material and of productive labor in producing whatever is produced, whether it be 1,000 cubic feet of gas, a kilowatt of electricity or a car mile of railway, that taking 15 per cent. of the investment required for that and adding it to the cash cost already obtained 2516 should produce a safe profit covering everything outside of ordinary small repairs, the reserve, the vicissitudes of the business, and in addition to that a dividend. The difficulty most aimed at in that 15 per cent. is one very common particularly among the smaller enterprises of a quasi-public nature in the United States which almost invariably forget and overlook the necessity of a proper reserve for the future.

Q. Of course, when you speak of the operating cost of the product to which this 15 per cent. on investment is to be added, you include what may be called the general expenses of a corporation like the office expenses and the salaries and the taxes and whatever——

A. Whatever is required, yes, in cash.

Q. And I also find in a communication in this book signed by you and addressed to the committee of the City Council——

Mr. Burr: What city?

Mr. Mathewson: I don't know, it doesn't say.

The Witness: It is regarding the cost of electric light. The City Council of Fostoria, Ohio.

Q. On page 137.

"If we can obtain money at 4 per cent. on bonds or mortgages, which have no risk whatever attendant upon them, we surely ought to allow to the average business man a profit of 8 per cent."

Is that a correct quotation?

A. Those are my sentiments, yes.

Q. And as though to anticipate your view, I find on page 160 your statement that

"Fifteen per cent. annual profit on the cash investment in a 120,000 light plant costing $2,000,000 should be a liberal 2517 allowance to a monopoly as covering a fair dividend, and allowing for deterioration."

So you would not make any distinction between a monopoly and an ordinary corporation engaged in this business?

A. A fairly conducted corporation.

Q. And I find that you also state on page 170:

"The writer may be pardoned, he trusts, for saying that a corporation capitalized only to the extent of its cash investment, restricted to a fair dividend of about 8 per cent. and a reserve of 7 per cent. for large renewals and repairs, is a beneficent institution."

A. That is right.

Q. And do I quote correctly from your book on page 213, where you say

"As the population of towns increase the price of gas appears to approximate more and more closely to the one dollar per thousand, and the cash surplus, over cost of manufacturing and distributing and fixed expenses, appears to be somewhere between 25 cents and 30 cents a thousand. At $1.00 for gas the price appears to have reached a practical minimum and the profit becomes dependent upon the reduction in investment per annual one thousand produced.

It should be remembered in a general way that one dollar in the price of each long ton of coal gas means about ten cents per thousand in the cost of gas, and that one cent per gallon in the price of oil used in carbureted water gas means about five cents per one thousand in the cost of gas. These latter three factors then, 2518 should control any attempt to go below the price of one dollar per thousand feet for gas."

A. That is entirely correct, sir.

Q. And then follows your statement that,

"It must not be assumed that in every instance reduction in price will assure increased consumption per capita, as might at first appear to be the case."

A. The word instances referring to the cities of Massachusetts.

Q. You refer to the possibility that the Consolidated Gas Company might make some additional profit by distributing gas in the Boroughs of Queens and others outside of Manhattan. That would require additional plant of course to produce the gas to be so distributed and with that we are not concerned. More than that have you any information that the Consolidated Gas Company has franchises that would permit it to operate or deliver gas outside of Manhattan? You know there are gas companies over there now in operation that have franchises in that territory, do you not?

A. I know there are companies which claim to have franchises there.

Q. Have you any information that the Consolidated Gas Company has franchises there which would legally enable it to distribute it if it chose to do so?

A. I have chanced in my investigation of the Brooklyn Gas Companies upon the names of the controlling syndicates and they are identical in many instances with the controlling syndicate of the Consolidated Gas Company.

Mr. Mathewson: I move to strike that out.

Motion denied. Exception.

2519 Mr. Burr: I think it is fair to state on the record that there is no evidence here that the Consolidated Gas Company has any right to operate outside of the Borough of Manhattan, nor is there any evidence here that the Astoria Light Company has a franchise to operate in the Borough of Manhattan.

Mr. Mathewson: I don't know that there is any evidence that the Astoria Light Company intends to operate in the Borough of Manhattan.

Mr. Burr: I think that is the only reason for its existence.

Mr. Mathewson: No, I guess not.

Q. When you spoke of the figures in the transcripts of accounts which have been submitted being unverified, did you refer to the fact that they had not been verified by you and Mr. Willoughby only, or did you refer to a supposed fact that no opportunity had been given anybody to verify them——

A. I presume that I should state——

Q. Well, what did you mean, that is what I want to know.

A. I mean that nobody with whom I was associated or acquainted in the present matter, had to my knowledge made such an examination, or, making such, had given me the information, and that I certainly had none myself nor had I been advised by the Corporation Counsel that anything of the nature of an investigation that was adequate had been obtained.

Q. If you have been here every day as you have testified, you certainly do know that the accountants for the defendant were invited to go to the office of the company and verify certain statements, do you not?

A. Referring to whom, may I ask?

2520 Q. Oh, referring to Mr. Cuthbert or Mr. Heyward, if you wish names, or anyone appointed by the defendants.

A. Mr. Cuthbert I have never known or spoken to.

Q. And if he checked accounts and vouchers wherever he asked for them and if he took away copies of certain vouchers that he asked for to display to counsel, that is something you don't know anything about, is it?

A. I certainly never had any of Mr. Cuthbert's accounts or statements in my hands. Mr. Heyward did make, I understood, an investigation of some sort at the outset, an incomplete and impartial one, giving me a few sundry memoranda. He afterwards told me that he had met Mr. Carter, the secretary, and had decided to defer further investigation until the State's accountants were through. This is as near as I can recall.

Q. Was that the last you heard of it?

A. The last I heard of it.

Q. Now you stated yesterday or the day before that in view of the enormous output of the Consolidated Gas Company, you thought the production should be at a low operating cost. Having read the testimony before the Gas Commission, do you not recall Professor Bemis' statement that after a company gets an output of some seven hundred million feet per annum that there is virtually no reduction in the operating cost beyond that because of the greater——

A. On what page was that?

Q. I cannot give you the page. I merely asked if you do not remember that. You say you examined the record with care. I will refer you to the page at the next session if you wish it?

A. I wish it, if you please.

D. Do you remember any such testimony?

A. I have the general impression that such testimony has been given.

Q. Have you any doubt of the truth of that testimony if it was given by Prof. Bemis?

2521 A. My point of view is the point of view of an individual who has been actively engaged in the actual work of distributing light and——

Q. Gas or electricity?

A. Electricity more particularly, and gas in a smaller way, and I have been impressed by the fact that in neither can one afford to generalize. The only way is to take up any locality that is presented for that purpose and with thorough care for the details to make a very careful and accurate investigation, placing the limitations either of electricity or of gas or of any other enterprise and finding, from a vast number of averages which I have collected, running into the thousands, that there is nothing so dangerous or so unreliable as an average statement where the factors deduced from averages are not produced in other analogous or almost similar circumstances to the proposition to which you wish to apply them.

Q. Then if your testimony is understood as generalizing on this subject you wish to withdraw it, do you?

A. I said nothing of the sort.

Q. But you say it is dangerous to generalize?

A. With certain qualifications.

Q. Did you not generalize when you expressed the view that the cost ought to be reduced because of the increasing output in New York?

A. With the qualification you have omitted from my statement.

Q. What is that?

A. Unless the factors which are deduced in averages are deduced from similar propositions.

Q. Well, assuming that the cost of gas from the year 1900 to 1904, 5 years, computed on the same basis as reported by Mr. Teal to the Stevens Committee, stood at sixty-one cents almost exactly for the 5 years and that for 1905 it was 60.75 cents as reported by the Gas Commission, that would not indicate any considerable decrease in 2522 the cost of production of gas in New York City by reason of the increase from year to year of its output, would it?

A. As a pro rata matter it would not appear to do so.

Q. And if I understand you correctly, you stated that gas could be produced in New York City perhaps as low as 45 cents because of the report of some accountants in Chicago that such was the result of their examination in Chicago, is that right?

A. No, I thought that the probabilities were that with management of an economical character it might be even a little lower.

Q. Than Chicago?

A. Than the 45½ cents found in Chicago. I am referring now to the cash cost of raw or crude material and of productive labor and also of office organization, etc.

Q. Do you know whether the 45 cents which the accountants reported in Chicago included anything for taxes?

A. The accountant's statement was that it did.

Q. That it included taxes?

A. Yes, and renewals.

Q. Do you know what proportion of the streets of Chicago are covered with asphalt or block pavement on concrete, or other new pavement of the expensive character which we have to go under in New York in attending to our distributing system?

A. That would affect the services only and I know that in Chicago they have continually increasing pavement of a better character going on, that is all I know about Chicago.

Q. Don't you know that the proportion of what may be called new pavement in Chicago is very small as compared with 90 per cent. and over in New York?

A. No, I do not know that.

Q. Don't you remember Professor Bemis saying that the cost of distribution in Chicago, would be affected in the way of reduction as compared with New York on account of the character of their
2523 streets which he described as very poorly paved?

A. I do not recall that fact.

Q. Do you know what they pay for oil in Chicago?

A. I don't know.

Q. Don't you remember that Professor Bemis' testimony was that they were able to get it there, nearer the fileds, for about three cents per gallon as against 4.08 cents which we pay here on the average?

A. I recall the fact that he mentioned three cents per gallon.

Q. Well, if that be true and that would be a difference of one cent per gallon in the cost of oil and over, that, according to your book which I have quoted, would mean a difference of about five cents in the cost of gas in favor of Chicago as against New York on the score of oil, wouldn't it?

A. In speaking of the possibility in the reduction of the cost of gas in New York to the figures given by the accountants for Chicago I did not assume that the management of the New York companies would differ very largely or the prices differ very largely from those obtained in Chicago. For instance the——

Q. Well, I am not going into that, if you will permit me. I don't care to waste time on that, but I ask you a question which I think is susceptible of an easy answer.

Mr. Mathewson: Mr. Stenographer, read the question.

The Stenographer (reading): Well, if that be true and that would be a difference of one cent per gallon in the cost of oil, that, according to your book which I have quoted, would mean a difference of about five cents in the cost of gas in the favor of Chicago as against New York on the score of oil, wouldn't it?

Mr. Mathewson: So far as the oil is concerned.

2524 A. I assume th[illegible]he oil could by proper management be procured at the same price in New York as it is in Chicago.

Q. Well, please assume the facts.

A. I have stated in my book that one cent in the price of oil will very nearly increase or decrease the cost of gas about five cents, which is true.

Q. Now, do you know whether Marwick, Mitchell & Company, these accountants who made the examination, were experts in the gas business or had any practical knowledge of the gas business?

Mr. Burr: That we went over yesterday.

Mr. **Mathewson**: Oh, no, we did not.

A. I have been told that they had had considerable experience in the gas business.

Q. In operating gas works?

A. In accounting gas works.

Q. Didn't you say the other day that the reports of accountants unless they were practically familiar with the gas business would give no idea as to what the cost of gas was or give any exact figure as to the cost of gas?

Mr. **Burr**: Objected to, because the testimony that was given yesterday was that accountants who had no special knowledge of the gas business unless advised by a gas engineer who had could not bring about the results that should be obtained.

Mr. **Mathewson**: They were not advised.

Mr. **Burr**: You evidently know all about it.

Mr. **Mathewson**: I do, a good deal more, I think, than you do, Mr. Burr.

Mr. **Burr**: There is his testimony yesterday though. You can refer to it.

The **Master**: I will allow him to answer the question.

2525 A. I said, referring to my testimony of yesterday: "A. Unless directed by someone familiar with the gas business."

Q. Have you any knowledge that these accountants were directed by any one familiar with the gas business, and if so by whom?

A. I was told that they themselves were familiar with the gas business.

Q. In what way?

A. As accountants.

Q. Any practical knowledge of gas operations?

A. Practical knowledge of the ordinary methods of gas accounting.

Q. Yes, but with the operations of gas companies, practically familiar?

A. I so inferred from what was stated to me.

Q. Did you understand that they had ever operated gas works or had been, as operators of gas works, concerned with the distributions of items to capital and operating cost?

Mr. **Burr**: Objected to as incompetent, irrelevant and immaterial. His understanding of what their capability or knowledge was, has nothing whatever to do with it.

Objection overruled; exception.

A. It was only a general knowledge.

Q. Will you point out to me in the report of these experts where they say they included taxes?

A. Report of the Committee of Gas, Oil and Electricity to the general council of the City of Chicago, January 29, 1906, page 8.

Q. That is not the report, I think, that statement of Mr. Cowdery, of St. Louis.

A. This is the report of the committee, you know.

Q. Oh, no.

A. Page 8, of the report of the committee.

2526 Q. No, that is the statement. I am talking now of the report of the accountants.

Mr. Burr: He is reading from the official report of the committee.

Mr. Mathewson: He has stated that they included taxes in their 45 cents and I ask where it is stated.

The Witness: I am reading from the report.

Q. The report of the accountants I refer to. Do you find any such statement in the report of the accountants?

A. I do not. I find it in the report of the committee.

Mr. Burr: On what page?

The Witness: On page 8.

Q. That is in the statement of Prof. Edward W. Bemis, quoted in this pamphlet, is it not?

A. As is also the report of the accountants.

Q. Precisely, but is there any statement in the report of the accountants that they included taxes?

A. I have answered that question.

Q. Is there?

A. I have answered that question by saying that they did not.

Q. Very good. Will you look on page 40 of this pamphlet and see if there is not a communication from Marwick, Mitchell & Company to the Hon. Lynn H. Young, chairman of the Committee of Gas, Oil & Electric Light of the Common Council of the City of Chicago, dated New York January 22, 1906, in which they say "no allowance is however included in either statement for the wear and tear which is usually conceded to occur in excess of what is covered by renewals." That statement appears, does it not, as I have quoted it?

A. I see that, yes.

Q. So that if there was wear and tear generally conceded in excess of the renewals actually paid out, that would mean an addition to the 45.45 cents, would it not, assuming the first amount to be correct? 2527

A. That is what I refer to in my various statements in my book covering in a general way all of those matters; the cost given by Marwick, Mitchell & Company is the cash cost to which I make continual reference in all I have testified in regard to gas.

Q. Now, while you have quoted from Prof. Bemis on page 8 of this pamphlet, have you observed that his final estimate of the amount chargeable for gas as appears at page 3 at the bottom is 51.96 cents, in round figures 52 cents?

A. I have observed it at the outset.

Q. And Mr. Cowdery of St. Louis, was 53.75 cents?

A. Yes.

Q. And Dr. Humphreys was 53 cents?

A. Yes.

Q. Who is Mr. Cowdery?

A. Manager of the Laclede Gas Works.

Q. A man of very large experience in the gas business, is he not?

A. A man of experience.

Q. And large experience, isn't he?

A. As to what extent it goes, I don't know.

Q. And these figures that I have given you are without allowance for reserve, which appears at the top of page 4, or accruing depreciation or reserve for contingencies or allowance for extraordinary depreciation as appeared at the top of said page 4 and also without any allowance for bond interest and dividends, which Prof. Bemis states to be 19.2 cents, Mr. Cowdery to be 34.92 cents and Dr. Humphreys to be about 32 cents; is that right?

A. All of whom were entitled to their own opinion.

Q. Certainly.

A. I have none regarding it.

Q. But the figures 51.96 for Bemis, 53.75 for Cowdery, and 53 for Humphreys were exclusive of these other items, which I have mentioned.

A. Apparently.

2528 Q. And the total including those for Prof. Bemis was 74.16 cents, Mr. Cowdery 98.67, and Dr. Humphreys 95 cents.

A. Yes.

Mr. Burr: Are you reading from the official report of the Chicago Committee of Gas, Oil and Electricity?

Mr. Mathewson: Yes, from this same pamphlet respecting which you have questioned the witness.

Q. Do you know how the cost of coal in Chicago compares to the cost in New York.

A. That depends upon whether it is anthracite or bituminous coal.

Q. Have you made any investigation as to the rate of wages payable in Chicago as compared with New York?

A. I have made none.

Q. Referring to your supposititious cost of $2.00 or less per thousand feet for the establishment of a gas plant, do you observe in this same pamphlet that Prof. Bemis estimates for the establishment of a plant, $3.20 per thousand cubic feet?

A. What page is that, is it page 19?

Q. Yes—pages 18 and 19.

A. I have read that and I presume that he did not use the capacity factor in estimating the value.

Q. No, but he does say, "I do not know of any gas company that was successfully floated, on a basis of 6 per cent. of its structural value with the exception of Cleveland. I do not know of any company that has started in with an entirely new plant on a basis of $3.20 per thousand output that was floated on a 6 per cent. basis." Is that correctly quoted?

A. On what page, if you please.

Q. Page 18, I believe, second column about the middle.

A. That seems correct.

—. And Prof. Bemis took $3.20 on the next page "as the 2529 approximate cost of structural value," did he not, in making his computations and discussions?

A. Apparently.

Q. Now you say you have read all the testimony before the Gas Commission. Do you remember Prof. Bemis' testimony that in Chicago there was practically no rock as there is in New York?

A. I do not, but I know that is a fact.

Q. So that the installation of a distributing system in the City of Chicago per mile of mains would be less expensive than in New York where there is a considerable amount of rock work to do, would it not?

A. I do not know how considerable the rock work is in New York, as I have not had an opportunity to examine the maps.

Q. You know there is considerable rock work from your own observation in going about town?

A. I have seen rock in New York.

Q. And that would tend to increase cost of the distributive system?

A. If the distributive system is in the rock.

Q So, too, as to the valuation of land, is not the situation in Chicago such that you can go to a greater distance from the centre of population to establish your plants than you are able to in the Island of Manhattan which is surrounded by water.

A. Appaently not, in the case of Astoria.

Q. Will you please answer my question?

A. No.

Mr. Mathewson: Well, I ask that the question be repeated and I ask that the witness answer it.

(Question read by stenographer.)

Q. We are dealing here with the plants which are established in this present valuation largely?

A. My answer is no.

Q. You think the land then in the outskirts of Chicago would be as valuable as land in the City of New York, where the gas 2530 plants of this Company are established, do you?

A. Positively, I am not a land expert.

Q. No, that is a fair answer. Would you expect the cost of plants constructed from time to time as the plants of the Consolidated Gas Company have been to be greater or less than the cost under similar conditions of an entire plant covering the whole capacity constructed at one time?

A. That would depend altogether on the scale of economy which was adopted in the construction of the new plant and largely on the ability of the engineer in design and in the capacity and shrewdness of the business manager and purchaser. There are a great many factors entering in——

Q. Oh, yes, but assuming those things to be equal, is it not a fact in your judgment if a plant were to be built to cover the entire capacity with everything before the engineer designing it, and the job to be done wholesale, so to speak, with full knowledge of what was required, that he could produce the plant for less money than would be invested in plants which were built for sixty or seventy years, to meet the requirement of consumption as it appeared?

A. That would depend largely on the scale of prices, whether it had or had not remained constant during the sixty or seventy years.

Q. Well, supposing those things to have remained constant?

A. That is a theory which is never true——

Q. Oh, of course.

A. But assuming such to be the case it would be easier to build, providing properly designed and cared for, a single station up to a large capacity, than to build a large number of small stations, and the result I think would be quite favorable in economy of installation and in economy of operation, subsequently.

2531 Q. Is it not your experience that products of iron, such as pipe, say, in the 70's, were very much more expensive than now, going as high as $50 or $60 a ton?

A. Even higher than that in the 70's.

Q. Now, in respect to Philadelphia, do you intend to assert that the Philadelphia Gas Company sells gas to anybody at 78 cents, and if so, to whom?

A. No. I have asserted that the average price received by the United Gas Improvement Company of Philadelphia for the gas that it sells or gives away to the city is about 78.1 cents during the past eight years.

Q. We will see whether it gives away any. As a matter of fact all the gas that the company sells so far as you know and for which it receives returns from the consumers of gas in Philadelphia aside from the city, is sold at $1.00, is it not?

A. It is.

Q. And am I right in the impression that some time ago an ordinance to reduce the price to 90 cents was defeated or vetoed by the Mayor?

A. It was vetoed by the Mayor.

Q. Now, the Philadelphia Gas Company as a matter of fact or the United Gas Improvement Company leases from the city a great part of the plant which it operates, the plant having originally belonged to the city, doesn't it?

A. It still belongs to the city.

Q. Certainly, it still belongs to the city and is merely leased by the gas company.

A. Yes.

Q. Now, whatever gas the company delivers to the city is delivered, is it not, in whole or in part, as compensation or rental for the property or plant of the city which the company is allowed to use, and it is not given to the city at all, except as consideration for the use of the property, is it not?

A. Well, I don't think that is specifically stated. I wonder if I have the lease here. No, I haven't the lease here; I have it at my office.

2532 Q. Well, is it not your recollection that the gas is delivered to the city as compensation for the use by the company of the property of the city which the company uses?

A. I know the gas is delivered to the city free of charge. I don't know——

Q. Pursuant to the contract under which the company uses the city's plant to manufacture gas?

A. Yes.

Q. Your 78.1 is obtained by dividing the amount received by the company from private consumers to which it sells gas at $1.00 by the gas delivered to private consumers plus the gas delivered to the city under this contract, is that not right?

A. My first affidavit, page 22. The United Gas Improvement Company, in return for the use of the gas works, Article 4, binds itself to spend not less than $15,000,000 for enlargements and improvements in thirty years. Article 5, the United Gas Improvement Company agrees to pay the City of Philadelphia $10,000 each year for salaries of inspectors of meters and gas, and to furnish at its own expense proper stations for testing the candle-power of gas located at a distance not less than one mile from each point of manufacture and to fully equip them.

Article 7. The United Gas Improvement Company agrees to supply without charge such amounts of gas as may be required for illuminating Philadelphia's public buildings.

Article 8. The United Gas Imporvement Company agrees to supply without charge all gas for the city's street lamps and lamps in public squares and to add at its own expense, 300 lamps each year to the existing number in 1897.

Article 9. The United Gas Improvement Company agrees, at its own cost and expense, to run all services, make all connections between street lamps and its distributing pipes or mains, to furnish all burners required on street lamps and light, clean, extinguish
2533 and repair lamps and lanterns and keep in repair all lampposts, lamps and lanterns in use during the term of this lease.

Article 10. Until otherwise provided by ordinances of Council to charge all consumers except the City $1.00 per thousand cubic feet retaining on this charge until December 31, 1907, 90 cents per thousand cubic feet; then until December 31, 1912, 85 cents per thousand cubic feet; then until December 31, 1917, 80 cents per thousand cubic feet; then until December 31, 1927, 75 cents per thousand cubic feet, and pay all surplus collected into the City Treasury.

During the present period the City is at liberty to retain about 10 cents for each one thousand cubic feet sold or, if the City Council so wish, to put the price of gas at 90 cents, leaving nothing for the City Treasury. To recapitulate, since 1897, a period of 8 years, the United Gas Improvement Company has collected of citizens $1.00 for every 1,000 cubic feet of 22 c. p. gas, and it has paid into the City Treasury about 10 cents per one thousand cubic feet of gas, and furnished free of charge all the gas required for street lights and public buildings in Philadelphia, and has at its own expense, lighted, extinguished, cleaned, repaired and connected lamp-posts and street lamps, furnished test inspection stations and paid $10,000 per year for salaries of such inspectors.

Mr. **Mathewson**: Now, will you read the question?

(Question read by Stenographer as follows):

Q. Your 78.1 cent- is obtained by dividing the amount received by the company from private consumers to which it sells gas at $1.00 by the gas delivered to private consumers plus the gas delivered to the City under this contract, is that not right?

2534 A. Is that the question?

Q. Yes, simply how you get 78.1?

A. Taking this statement and embodying the figures required——

Mr. Mathewson: Will you read the question?

Question repeated.

Q. Is that right?

A. Taking the figures arising under this contract, we find the net balance of the United Gas Improvement Company to be $35,085,479.40 which is divided by the sum of 40,243,341,550 cubic feet plus 4,639,899,816 cubic feet, and gives an average of 78.1 cents.

Mr. Burr: As what?

The Witness: As the actual price per thousand cubic feet received by the United Gas Improvement Company of Philadelphia during the eight years.

Q. But if you charge one dollar to private citizens of Philadelphia, that is to everybody for gas, how is it possible to get the amount received for that gas on the part of the company down to 78 cents?

A. By the method explained just immediately before this; the figures are given.

Q. That 78 cents does not include anything for taxes, does it, on the plant of the City which it leased to the company?

A. It is the price, not the cost of gas I am giving.

Q. Well, I suppose the price at which a product may be sold depends upon the expenditures that the producer has to make. You do not understand that the U. G. I. Company has to pay anything for taxes on the city's plant which it is using, do you?

A. I know that city property is not taxed. I don't know whether the U. G. I. is or is not taxed on any portion of it.

2535 Q. Well, if you assume taxes to be on their plant, about 7 cents per thousand, as the testimony is they are in New York, and add that to 78 cents, that would make 85 cents, would it not?

A. 78 and 7 cents, 85 cents.

Q. As a matter of fact the U. G. I. Company do not have to earn and pay dividends on the value of the city plant which they use, and which a private company would be obliged to establish and earn upon, does it?

A. No, I think not.

Q. That would make a difference also in the calculation of a price at which gas would be fairly produced and sold, would it not?

A. They are very secretive about the question of their actual expenditures and their stock issues and their bonds. In fact there has been a good deal of public quarreling about them.

Q. Well, but as a matter of fact, if you do not have to earn and pay a dividend upon a capital that would naturally result in the ability to sell the product lower?

A. They claim that they have already expended the equivalent of $2.15 per annual thousand.

Q. Yes, I will come to that in a moment. But does the 40,243,341,550 cubic feet of gas which you specify in the table at page 29 include the gas which was delivered to the city or city buildings or lamps?

A. Column 3, you will observe gives you the free gas, 4,639,899,816.

Q. Yes, I understand that, but is that included in the forty billion?

A. Is what included in the forty billion?

Q. The 4,689,899,816?

A. No, not at all.

Q. If you will turn to page 33 of your affidavit it appears that in addition to the works belonging to the city of Philadelphia which the U. G. I. Company operates under lease it has added according to your statement additional plant which belongs to the Com-
2536 pany amounting to $16,018,192.22. Is that correct?

A. That is correct as the public statement made by them and printed in a Philadelphia newspaper.

Q. And that amounts to $2.15 annual thousand sales, doesn't it?

A. Yes, per annual thousand cubic feet of gas.

Q. Yes, which standing alone and excluding entirely the city plants which they lease and which they operate amounts to more than the $2.00 which you assumed as the structural value of a gas plant?

A. Yes, sir, it does.

Q. Now, as a matter of fact, is it not stipulated in the contract that if the lease is terminated the city of Philadelphia shall take over this plant which the Company has established and which amounts to $16,018,192.22, paying therefor the cost with 6 per cent.?

A. Yes.

Q. Now, are you familiar with a report of the Mayor of Philadelphia to the Special Senate Committee of Pennsylvania in or about May, 1895, in which Mayor Warwick estimates the value of the gas works belonging to the city at $30,000,000?

A. No, I am not familiar with that report. I was well acquainted with Mayor Warwick, though.

Q. Well, I am shown an extract from the report of the Special Senate Committee of May 8th, 1895, in which this appears. If it be true that the value of the Philadelphia city's plant which is used by the U. G. I. Company, is $30,000,000 and the value of the additional plants of the U. G. I. is $16,000,000 and over, that would make the total value of plant in Philadelphia upwards of $46,000,000, would it not?

A. If those statements were correct, yes.

Q. So instead of $2.15 as the structural value of the Philadelphia gas works, it would be something nearly three times that or about $6.00 per thousand cubic feet of output?

2537 A. That is true, and all of it is absolutely worthless from an engineering point of view, both the statement——

Q. Well, it was considered the fact, that the Company's addition to plant, which the city is to buy if it terminates the lease, amounts to $16,000,000 and more. You considered that of sufficient probability so you have included it in your affidavit on this motion, have you not? You covered quite a large amount of your affidavit with the discussion of the subject at Philadelphia?

A. Referring to what?

Q. Referring to the structural value or cost of the plant which the U. G. I. has established in Philadelphia in addition to the plants of the city which the U. G. I. Co. leases and operates in the production of its gas?

A. What page?

Q. Page 33.

A. On page 33, I occupied one paragraph, making this statement:

"In his annual report of the U. G. I. Co., the statement is made that its investments in the Philadelphia Gas Works for building, apparatus, machinery, mains, pipes, services, connections, meters, appliances and appurtenances of the Philadelphia Gas Works, together with simple interest at 6 per cent., amounted to $16,018,192.22, which divided by the gas sold or given away during 1905 amounting to 7,434,524,760 cubic feet, gives $2.15 per annual one thousand cubic feet of gas."

Mr. Burr: What report did you refer to there in your affidavit, to the annual report?

The Witness: In this annual report of the United Gas Improvement Company.

Mr. Burr: You are not referring to the report to which Mr. Mathewson has just called your attention, by Mayor Warwick.

The Witness: Oh, no.

2538 Q. Well, there is one point which I am not quite clear upon. Referring to your total on page 29, in order to get 78.1 what divisor did you use?

A. 40,243,341,550 plus 4,639,899,816, I think it is. I think there is a misprint there.

Q. So, as a matter of fact, you did divide the amount received by the United Gas Improvement Company by private consumers for gas delivered to them by the amount of gas delivered to private consumers plus the amount of gas delivered to the city?

A. I so stated in my affidavit.

Q. I did not understand whether that was so or not.

A. Yes.

Q. You have referred to the report of J. Yalden, accountant for the Committee of 1886, and quoted from him a cost of $20,942,000 to the original companies of the plants as they existed in 1884. Did that 20,000,000——

A. At what page of my affidavit?

Q. I cannot tell you the page of your affidavit. It is down here, page 776, I think.

A. $20,942,632.85. I do not recall making such a statement or making out that figure.

Q. My recollection is that you did, but if I am mistaken——

A. I think Mr. Burr made use of that figure.

Q. My recollection is that you did, but if I am mistaken——

A. I think Mr. Burr made use of that figure but not myself.

Q. Did you not make use of the figure or the details or analysis of that figure in your testimony?

A. In my testimony I used a large number of fragmentary figures for the various divisions, but not the lump sum.

Q. Purporting to show the cost in those cases to the original companies of the property with which you were dealing?

A. Yes.

2539 Q. Now, that figure of $20,942,000 does not include, does it, any accounts receivable or any cash or other working capital, nor even materials and supplies?

A. Well, as I stated to you before, I had not investigated that in my testimony. That was brought out by Mr. Burr, but not for myself. I could look that up, if you wish, between now and to-morrow.

Q. Very good. You say that you read the testimony before that Commission. Is it not the fact that Mr. Yalden's report so far as you have examined it merely gave the figures at which the various items of property were carried on the books of the constituent companies?

Mr. Burr: Well, the report, I would suggest, is in evidence and speaks for itself.

Mr. Mathewson: The testimony is not in evidence and he says he has read all the testimony. I am merely asking him for his information in this regard, whether that shows anything more than the figures at which the various items of *of* property were carried on the books of the constituent companies.

The Witness: On page 636 J. Yalden makes the statement as follows:

"To show these results I have compiled separate tables for each company, assimilated as near as practicable, giving the analysis of the Profit and Loss accounts, an account showing the capital used in their business, the investments on account of real estate, mains, meters, services, etc., the particulars of the sales to the Consolidated Gas Company, an account showing the dividends paid to the stockholders and a calculation thereon giving the difference between 10 per cent. on the capital stock as paid up and the actual sum 2540 divided. This is followed by a consideration in detail of the books of each of the six companies incorporated."

Q. Yes, but so far as your investigation goes, are not the figures of Mr. Yalden merely the figures at which the various items appeared on the books of the companies in their capital account or asset account?

A. In some cases, yes; in others, these figures are followed by notes elucidating the real meaning of the figures.

Q. That is quite true, but the figures themselves as relating to the different items are merely figures at which those items appear on the books of the company, is not that correct?

A. He appears to be a most excellent accountant and the figures are given accurately and annotated where he thinks they need further lucidation.

Q. But with that exception you would answer my question in the affirmative, or rather, with that explanation?

A. Yes.

Q. In examining the testimony there did you find any evidence at all introduced as to what was the actual cost to the constituent companies of the various items of property or any record of examination of vouchers or otherwise to determine whether the figures at which they were carried on the books of the company really represented their original cost or whether they represented the cost as charged down or charged off?

A. Yes; for instance, take the Manhattan Gas Light Company, price of sale to the Consolidated Gas Company, November 11, 1884, page 671. Account to Real Estate and also to plant——

Q. To plant, how much?

A. On page 672 the following note occurs. The plant given in detail is put at $64,247.49 and then the further explanation of real estate is: "Real Estate, additions and improvements, North
2541 River, $1,774,919.38; Real Estate, additions and improve-
ments, East River, $1,486,607.42; Real Estate, additions and improvements, Irving Plaec, $90.203,94; making a total of $3,251,730.74."

Q. That is not my question, Professor. I do not think you quite had in hand what I meant.

A. That is where I——

Q. You say you have gone over the testimony and read the testimony given before that Commission, and I want to know whether you found any testimony before that Commission of any witness, that the original cost of any item of assets of these six constituent companies was actually the figure at which that item was carried on the books of the company.

A. No, unless Mr. Yalden is a witness.

Q. No, he simply took the figures, that is the point.

Mr. Burr: The report refers to the situation in that regard.

Mr. Mathewson: Yes, so it does, and I will call attention to the report.

Mr. Burr: And so did Mr. Gawtry in his testimony.

Mr. Mathewson: Well, I will not ask the witness regarding this, and in view of Mr. Burr's statement this report which is in evidence, if the Master please, is that the majority of the Commission did not determine the original cost, stating that they did not consider it necessary, in view of the fact that the Act of 1884 authorized the consolidation upon the basis of the then value of the property.

Mr. Burr: I have not characterized what the report is, but I see that the report speaks of the situation as they found it in that regard.

Mr. Mathewson: Yes, and the majority of the Commis-
2542 sion, as the Master will observe, stated that there was no evi-
dence that they were valued higher than they were worth, except the evidence that they seem to have been valued higher than they appeared to have been charged on the company's books.

Q. Now, you said that at the time of the consolidation, or at the time of the formation of the Consolidated Gas Company nothing was sold and nothing was paid for.

A. On what page, please?

Q. I cannot tell you. But am I not correct in substance in quoting your statement, or don't you remember what you did say?

Mr. **Burr**: If you have his testimony before you, refer him to some specific statement, as it would be much easier.

Mr. **Mathewson**: That was yesterday's testimony, and I only received it as I came in this morning, and I have not had time to annotate it.

Mr. **Burr**: I do not think it was yesterday.

The **Master**: I think it was the first day.

Mr. **Mathewson**: Perhaps so.

The **Master**: Well, is it important as to the language?

The **Witness**: Whatever the printed matter may show, I recall that I said that so far as the stockholders were concerned, nothing was sold and nothing was paid for in money. Of course the minor matters of——

Mr. **Mathewson**: Page 2346, the middle of the page.

Mr. **Burr**: Well, you quoted it from memory almost exactly.

2543 The **Witness**: So far as the stockholders were concerned.

Q. Does your statement apply only to the tangible assets appraised at $29,994,000 in 1884 and the franchises appraised at $7,781,000, making a total of $37,7[illegible],000?

A. Only to stockholders, and what they gave and what they received.

Q. Does it apply only to those two amounts which I have specified, or the property which was covered by those two valuations?

A. Well, so far as the stockholders were concerned.

Q. You do know, don't you, that from the constituent companies immediately following the consolidation there were obtained further assets of one kind and another for which the Consolidated Gas Company paid to the constituent companies something like $600,000 or perhaps more?

A. Yes, I spoke only of the stockholders and what the stockholders did.

Q. And of the property included in the original appraisement to which I have referred?

A. And to the property which at that time was transferred from the six companies to the Consolidated Gas Company.

Mr. **Burr**: I think there is a word omitted in this statement: "The stockholders of the six companies received in exchange for their stock certificates in this company an average of about what was their face value in the stock of the Consolidated Gas Company." See page 2347. Was it not double?

The **Witness**: About twice their face value.

Mr. **Burr**: So that correction is to be noted there.

Q. You do not understand, do you, that the $20,942,000 2544 to which reference has been made included the franchises of the constituent companies?

A. I have never looked into that total. I will do so, if you like, between now and to-morrow.

Mr. **Mathewson**: Is it claimed that that did include franchises, or that there was any item of franchises going to make up that amount of $20,294,000 which you say the property of the constituent companies was carried at on their books?

Mr. **Burr**: I would not say at this moment.

Mr. **Mathewson**: My information is that it does not, and I wish to have it clear if I am right or wrong.

Q. You know that the constituent companies, some of them, were very prosperous and were paying very large dividends prior to the consolidation, don't you?

A. I do.

Q. And is it not your general experience that companies in that situation are liable to pay construction out of operating cost or to charge down very liberally for depreciation of plant or otherwise?

A. I would not like to say from so limited a general experience as I have had that this applies exactly to gas companies, but I should say that the American is very apt to be lavish when he has plenty of money.

Q. Yes, and so you have known a great many instances where the book value of assets does not represent what the investment therein was, have you not?

A. I have; and the reverse also.

Q. And do you observe in the report of the committee of 1886, a statement that $39,078,000 which included franchises at $7,781,000 and tangible property at $29,994,000 and $1,103,000 for working capital, was only the market value of the securities of the
2545 constituent companies outstanding at the time of the consolidation?

A. I understand that the very basis of the whole consolidation was an attempt to take the existing stocks, add to them their premiums and to increase the stock of the Consolidated Gas Company for distribution to a point which was equivalent to the par value plus a premium on the stock of the original six companies.

Q. That is to the market values of the six constituent companies?

A. Whatever that was.

Q. On certain computations to which I shall call attention in a few moments, you said you were compelled to take the company's figures as to the sales of gas for the last year or two. Don't you know that the company's sales and their amount was checked over by the accountant for one — the defendants?

A. May I ask the name?

Mr. **Mathewson**: Mr. Cuthbert wasn't it?

Mr. **Carter**: Yes.

Q. By Mr. Cuthbert, for the express purpose of verifying the sales as they were presented in the exhibit.

A. Nothing coming from Mr. Cuthbert has been handed me by any of the defendants.

Q. And you have not been informed by Mr. Hayward of the truth of those figures?

A. Mr. Hayward seemed to be very enthusiastic with regard to the skill and ability displayed in their bookkeeping, but did not go into details.

Q. You made certain deductions as to the structural cost of plants in Massachusetts in the cities of Cambridge, Fall River, Lowell and Worcester, showing that their structural values as carried on the books of those four companies averaged $3.20 per thousand feet of sales. And you then computed what the capitalization per thousand feet of sales would be, provided the sales of the company equalled what you assumed to be the full capacity of the plants. Do
2546 you remember what that latter figure was per thousand feet of sales? $1.75 appears at page 2351 of the record, if that is right?

A. Page 2351, structural cost per annual thousand, divisor——

Q. No matter about the divisor, I am merely asking the figure which you obtained as the structural cost per thousand?

A. $1.78.

Q. That was on the assumption that each one of these plants produced the daily capacity evidenced in the fourth column, was it not?

A. You mean the year through?

Q. No, that that is the daily maximum capacity, as you might call it, or a maximum capacity for a day?

A. It is the daily capacity returned by the company's managers to the Massachusetts Gas and Electricity Commission.

Q. Does the company return to the Massachusetts Gas an- Electricity Commission a statement of its annual capacity?

A. Yes.

Q. Or of its daily maximum capacity?

A. It has given its daily maximum capacity in cubic feet.

Q. You did not obtain this by dividing the annual capacity by 200?

A. No, it is from the book as referred to here.

Q. Will you show me the book and the column, I refer to the Massachusetts report from which you have been quoting in that testimony?

A. Yes.

Q. Just give me the page and column of that report?

A. Page 114, report for the calendar year 1905.

Q. Now, taking the last one of the four cities, Worcester, I find on page 115 of this report for 1905 of the Massachusetts Gas Commission the greatest output on any one day was 2,019,000 feet, is that correct?

A. That is correct.

Q. Now, the 4,200,000 which you have placed in the fourth column under the head of daily capacity appears on the left
2547 on page 115 of this report and is under what heading?

A. Daily capacity of works.

Q. Yes. Do you understand works to mean the distributing system of the company and they could distribute 4,200,000 feet of gas daily as their distributing plant now stands, including meters, services, mains, etc.?

A. Well, I presume that under pressure, as far as the mains are concerned, if they could get out that much out of the works, that they could also get it through their mains and to consumers.

Q. But let us take the conditions which you understand to prevail generally in Worcester and such places. Do you think that the Company could more than double their output without the requirement of more meters and more services to furnish their consumers? Would not that increased output mean more meters, services and a larger plant and distributing system naturally and also almost inevitably according to your experience?

A. Yes, that is the reason why I made an extra allowance of about five million dollars for the gas sales of purchased gas in the case of the Consolidated Gas Company.

Q. No, I am speaking now of the Worcester Gas Company. Would you not expect if and when their output became 4,200,000 feet that their distributing plant would be larger and a greater investment in it than when their output is only 2,019,000 feet per day.

A. Well, without a careful local investigation I could not express an opinion on that.

Q. Taking your general understanding of the gas business, would you not expect that when the daily output of Worcester more than doubled beyond the present two million feet that that would mean more consumers, and more meters and more services and a greater distributing plant than exists to-day?

2548 A. That is a generalization in which I would add to the facts actually stated by the managers on their reports to the Massachusetts State Gas and Electricity Commission, and I have taken as what they have stated as being in round figures and approximately correct.

Q. But this document here is headed "Daily Capacity of Works?"

A. Yes.

Q. You do not understand it to include the distributing system of the company, do you?

A. I understood this much that the distributing system was probably quite equal to any demands that came upon it, and with a very large surplus.

Q. But is it not your experience that if the demand comes for double the amount of gas which they now sell, it would — more consumers, and therefore more meters and more services than at present existing?

A. Naturally, yes. Increased demand means increased meters and services.

Q. Then if that be the case the amount of your structural assets when you name to your maximum output would probably be greater than the structural assets as they appear to-day, would they not?

A. No, that would be *pro rata* less per annual thousand of sales.

Q. Yes, but you have already taken the full capacity of 4,200,000 feet per day and anticipated that increase in dividing——

A. Well, I also call your attention to the fact that under existing circumstances of actual output that the actual structural cost amounted to $3.20 and that the capacity factor amounted to $111.3.

Q. But let me call your attention to this, you have taken the amount of structural assets of the Company as you assume them to appear upon the books to-day and have divided those structural assets not by the output as it is to-day, that is 2,000,000 feet, but by more than twice that or 4,200,000 feet, in the case of Worcester, 2549 which would give a lower quotient than would result had you divided the structural assets as they will exist when the Company has an output of 4,200,000 by 4,200,000. That is the point, and if there would be an increase in the structural assets at the time that the daily capacity of 4,200,000 is reached then your $1.78 would be too low a quotient, would it not?

A. That is a little too long to answer directly. I have assumed this, that the daily capacity of any works multiplied by a capacity factor of 200, which factor has been fixed by Mr. Bradley, Chief Engineer, and who is well known to most gas engineers.

Mr. MATHEWSON: We accept that.

The WITNESS (continuing): And that is not 365 days which would be necessary to make good your statement that every day the works would be run to a capacity of 4,200,000 cubic feet.

Q. I do not make any such statement and I do not make any such ridiculous claim. I should rebut it if you made it. My point is this, you have obtained $1.78 by dividing the value of the structural assets as they are carried on these books now; by an output more than double the present output; in other words by an output equal to the capacity of the works.

A. Not quite, less than double, if you please.

Q. Well, call it that, it is more anyway than the present output. Now, in the case of Worcester, the daily capacity is stated at 4,200,000 and the gross output is stated at 2,019,000, so that in that case the estimated capacity is greater than the present output as I have stated. But is not this a fact, that if the structural assets should be greater when this daily capacity is reached and that greater amount of gas is put out than now then your figure of $1.78 would be too low.

2550 A. The figure given for Worcester under which you are speaking with a capacity factor of 200 is not $1.78 but $1.54 which is a much lower sum.

Q. Oh, do not take one case, take any case or all the cases. I think you understand what my question is, don't you, Professor, and is it difficult to answer it?

A. No, but you took an average of four cases, and then you took a single case, Worcester, and you mixed them up.

Q. No, I didn't mix them up at all. I am sorry I mixed you up for I didn't intend to. But confining ourselves to Worcester for the moment and we will assume the quotient is $1.54. Now, if the assets at Worcester when the output reaches 4,200,000 feet for the maximum daily capacity, which would mean an annual capacity of 200 times that, shall exceed the structural assets $1,296,571.04, then your quotient would be somewhat greater than $1.54, wouldn't it, for the value of the structural assets at that time?

A. Not necessarily. It could not be decided except by a careful inspection of the Worcester works whether that would or would not.

Q. Oh, well, these are figures which you assumed, I did not assume them. We are assuming that the value of the structural assets is now $1,296,571.04 for Worcester, and I say that if the structural assets were greater than that at the time when the maximum capacity was reached, which is more than twice the present output, then the structural cost per annual thousand would not be $1.54 but would be something greater than that, wouldn't it?

A. Well, if you increase the structural assets without increasing the capacity, the daily capacity then, of course, using a capacity factor of 200 then your average of $1.54 per annual thousand might be increased to any amount, dependent entirely on how
2551 much you swell the sum of $1,296,571.04 without increasing thereby the capacity of the works and mains.

Q. Precisely. Now, did you make any examination of the Worcester works at all to see whether their full capacity was actually 4,200,000 cubic feet, even at the works, all parts of the works, or whether it is simply applied to the generating part?

A. I have visited Worcester lately a couple of times in connection with my engineering work and merely casually looked at the works. Of course I have to take these figures from the report of the Gas and Electric Light Commissioners, but they appeared to me to be exceedingly neat and well managed so far as I was able to go, as a mere stranger.

Q. Well, now do you understand that the purifying apparatus at the works is sufficient to take care of 4,200,000?

A. The book so states——

Q. The book states that the purifying apparatus has a capacity of 4,200,000 cubic feet per day, are you sure about that?

A. The book states so.

Q. What books?

A. The book—the report which is before you of 1905.

Q. Of the Massachusetts Gas Commission?

A. Of the Massachusetts Gas Commission.

Q. You do not mean to say that the books of the Worcester Gas Company show that they have a purifying capacity——

A. I know nothing about that. I am referring to the book in my own possession here.

Q. If I am informed and if I am correct that the purifying capacity is not much if any over 3,000,000 feet per day, and that the generating capacity is 4,200,000 feet, that would make an additional amount to be charged to structural assets beyond any increase in distribution system if you were to have an output of 4,200,000 feet per day, wouldn't it?

A. Possibly.

2552 Q. So that all of these deductions depend upon investigations which you have not personally made as to the capacity of the various parts of the plant, is that so?

Mr. Burr: That is hardly a fair assumption.

A. Hardly. I am taking a statement of the Commission which has long been known as careful and accurate in all its statements.

Q. But it is not your own investigation at all except as you took it from reports of the Commission, is it?

A. No.

Mr. **Burr**: It is after half past four and I suggest that we take a recess now.

Mr. **Mathewson**: It will take me some time to finish with this subject.

At 4.30 P. M. adjourned to October 5, 1906, at 11 A. M.

Last Exhibits:

Complainant's 255,
State's W,
City's 54.

2553 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; **William Travers Jerome**, as District Attorney of New York County; **Frederick E. Gunnison**, **John C. Davies**, and **Lucian L. Shedden**, Constituting the New York State Commission of Gas and Electricity, and **The City of New York**, Defendants.

Before Arthur H. Masten, Special Master.

New York, Friday, *October 5th*, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr.

2554 **William D. Marks** resumes the stand.

Cross-examination continued by Mr. **Mathewson**:

Q. Have you ever operated a well-established gas works which has been in operation for many years in which the sales were subsequently doubled without increasing the investment in works or the distribution system, or both?

A. First of all, I have never operated a gas works for a number of years consecutively. My work has been the building of them to such an extent as they have gone and the inauguration of them.

Q. I merely asked you as to your experience. You gave your views yesterday. Do you know, and if so will you name any engineer or any corporation that has established or proceeded with the establishment of a gas plant in the East upon a basis of $1.78 per thousand feet to cover land, plant, mains and all other investment, including working capital?

A. Including working capital, do you say?

Q. Yes, including the whole investment which the company requires for its gas business?

A. Referring to the four Massachusetts gas companies, the $1.78 of which you speak was derived entirely as actual structural cost, and does not include the working capital.

Q. Well, exclude working capital, but I ask you the same question, if you will give me the name of any engineer who has taken the formula of $1.78, or any smaller amount, and proceeded under that formula for the construction of a gas works in the East, including all the investment required, including land, except working capital?

A. Those are my own figures, and I cannot give you the figures of other engineers.

2555 Q. Now, do I understand in this computation that you accepted blindly, to use your own word, the figures in the report which these companies made to the Massachusetts Gas Commission, without even an examination of the individuals who made them for explanation or verification?

A. I took the figures as given by the report of the Massachusetts Gas and Electricity Commission in their report for 1905.

Q. Now let us take the four companies, Cambridge, Fall River, Lowell and Worcester, to which you have testified on page 2351 and following. You say those four stations in Massachusetts, or cities, were chosen as resembling New York. Will you state in what respects they resemble New York?

A. As being a group of stations, similar, as nearly as could be found, to the group of stations owned by the Consolidated Gas Company.

Q. You don't claim that the cities themselves particularly resemble New York, do you?

A. I was very careful to state their population.

Q. In other respects except population?

A. A great deal could be said, but I will say that they are all of them a much poorer field for gas sales than New York City. I can add to that to any extent that you may desire.

Q. Well, we were speaking now of the structural cost of the plants of the company, not of the field for sales. You spoke about holders. Do you know whether these companies in Massachusetts have any greater proportion of small holders than the Consolidated Gas Company has?

A. I have not the details as to the holders of these companies. Their daily capacity being small as compared with the New York capacity and output, they would require smaller holders.

Q. Would they necessarily require smaller holders, or a smaller holder capacity? Which do you mean?

A. Both.

2556 Q. Don't you know that the Consolidated Gas Company has quite a large number of small holders which have been established to meet the requirements of consumption in the past?

A. I do, relatively speaking.

Q. Did you make any investigation in Massachusetts of these four companies to show to what extent, if at all, they had increased their plants, being prosperous companies, without charging the increase adequately in either to share capital or to construction cost in their books?

A. I confined myself to actual figures given in the books and in the sworn report of the Massachusetts State Gas and Electricity Commission.

Q. Don't you know that it is well understood among gas engineers in the East that the Massachusetts companies put money largely into additional construction without charge in their books to additional capital account?

A. I presume instances of that sort have occurred. I don't believe it to be general.

Q. You haven't any personal information on the subject, have you?

A. I have heard the matter discussed.

Q. Have you seen the sworn report of these companies or is your information taken wholly from the report of the Gas Commission in which they are quoted?

A. My information is taken from the report of the Massachusetts State Gas and Electricity Commission for 1905.

Q. Do I understand you to say that the cost of land in New York to the Consolidated Gas Company or to the six constituent companies which forms it was less than the cost of land to the gas companies in these four cities in Massachusetts to which you refer?

A. You did not. I stated distinctly I am not a land expert.

2557 Q. You stated that subsequently. What did you say? Didn't you say in substance in your direct testimony that land cost the original companies in your opinion in New York no more than it cost the four Boston gas companies?

A. At what page?

Q. I ask you if you did not so testify?

A. I do not recall.

Q. I have a note to that effect and you either so testified or I misunderstood you.

A. I do not recall it, but——

Q. If you did so testify, do you wish to modify it?

A. If you will allow me. I do not recall making such a statement, but as nearly every bit of the land of the Consolidated Gas Company was purchased anterior to 1884 and some of it as far back as 1823 and 1824 it is probable that the average cost of land is somewhat akin to the average cost of the land in these smaller cities.

Q. Do you say that as a real estate expert or on your general judgment as a man?

A. On my general judgment. I am not a real estate expert.

Q. Now, Doctor, how long has the Lowell Gas Company been in existence and when did they buy their land?

A. I could not state without reference to the figures.

Q. Do you know what the population of Lowell was or is now as compared with the population of New York even in 1823?

A. The population of Lowell now is given as 94,889.

Q. Was not the population of New York even in 1823 a great deal more than that?

A. I could tell if I had reference to the census.

Q. Well, what do you think? Have you any doubt about it without looking at the census?

A. I recollect visiting New York as a boy in 1865 and I recollect that the buildings became rather thin back of the Astor House
2558 up Broadway, and that at 42nd Street there was termination
of all travel, showing it to be quite a small city as compared to what it is now.

Q. Oh, yes; no doubt about that; but have you any doubt that in 1823 it was a larger city than Lowell is to-day?

A. I cannot give you any opinion on that point.

Q. Do you know when the Cambridge Gas Company bought its land?

A. I do not. I can look it up if you wish.

Q. Do you know when the Fall River Company bought its land?

A. I don't know when any of these companies bought their land nor did I look it up.

Q. Well, then have you any special basis for saying that you think the cost of land to these companies in the smaller Massachusetts cities, whenever it was bought, which you don't know, was no greater than the cost of land to the six constituent companies of the Consolidated Gas Company, which land was bought from 1823 up to 1884 or such a matter?

A. Yes, I looked over J. Yalden's report of the stated cost of the real estate anterior to 1884, so far as he could get it from the books.

Q. But you did not find in J. Yalden's report any report of the cost of land in Worcester, Lowell, Fall River or Cambridge, did you?

A. It was the cost of land in New York apparently.

Q. Have you any basis for stating that, in your judgment, the cost of land in New York to the constituent companies of the Consolidated Gas Company was no greater than it was to the four companies which you have named and, if so, state the foundation for that conclusion?

A. Careful study of the cost first made out from the original six books by Mr. Yalden and a subsequent study of such fragmentary information as was furnished in the testimony showing that
2559 sales at very good prices of considerable amounts of real estate
had been made by the Consolidated Gas Company, enabling me to draw a rough inference that the total cost of the land was something less than three million—I mean the actual cost—how much less I do not know.

Q. The cost of the land now used you say by the Consolidated Gas Company in its business?

A. Yes, that is what I mean.

Q. Now, won't you go a step further and tell me the foundation of your belief or conclusion that the Massachusetts gas companies, to which you have referred, paid as much for their land as the New York companies did for theirs?

A. Simply the question of the population of the cities and my general knowledge of the growth of cities, as I was very careful to state in my investigation that it was only a rude approximation and necessarily would be until I had more accurate information.

Q. But if you know neither the dates when either one of these companies purchased its land and do not know the population of those cities when the land was purchased, and do not even know the population of the City of New York when the New York companies purchased their lands, how does that give you any basis for that conclusion, in figuring upon the population?

A. Nothing more than a rude approximation was attempted or asserted.

By Mr. BURR:

Q. As to the value of the land?

A. As to the value of the land.

Q. In Massachusetts?

A. In Massachusetts or in New York.

By Mr. MATHEWSON:

2560 Q. Well, the cost of land is a very substantial element, isn't it, of the cost of a gas works and plant?

A. Sometimes, yes.

Q. And if the cost of land in New York City were substantially greater than the cost of land in Cambridge, Fall River, Lowell and Worcester, that fact would substantially affect any comparison which you chose to make on the basis of structural cost to these four Massachusetts companies per thousand feet of output or capacity, wouldn't it?

A. So far as the real estate was concerned, yes.

Q. Now, isn't it true that the average capital in the United States in gas undertakings per thousand feet is about $8.47 per thousand?

A. So the United States census is asserted to have said, but that includes a vast number of other small companies.

Q. Naturally. And isn't it true that by the same census it appears that the structural value of the plants of the gas companies in the United States, taken together, averages $7.23 per thousand feet?

A. Per thousand feet of what?

Q. Sales.

A. Thousand feet of sales?

Q. Yes.

A. Was there no capacity factor used?

Q. Well, I am asking you, Doctor. I think you referred in your affidavit to the showing of the United States census.

A. To state that it must be incorrect, I did.

Q. What is that?

A. To state that it must be incorrect, I did.

Q. Well, that is your conclusion, but I am asking you what the census shows?

A. The census shows what it shows, and you can refer to it.

Q. Well, will you state or can you state what that $7.23 represents or purports to represent in the United States census?

A. On page 11 of my first affidavit I have made the statement,

"It can hardly be claimed that a valuation fixed in this manner by inexpert legislators and lawyers can be accepted as a standard
2561 for the valuation of other works, nor would it be just to accept
an average capital per thousand feet sold of $8.47 taken from the United States census as a basis on which to compute the proper capital employed in the gas works of the Island of Manhattan, since this average is obtained from an immense number of small gas works distributed all over the United States"——

Q. We understand that if it includes all the gas works in the United States it must include small as well as large companies. I am asking you what you understand this $7.23 in the United States census given as the structural value per thousand feet of all gas companies represents?

A. I am trying to find it. I do not recall that I have stated that figure.

Q. Well you are familiar with it, are you not?

A. I have heard it.

Q. And what do you understand that represents, $7.23 per what—thousands of sales or thousands of capacity?

A. I have not studied it specifically.

Q. But your recollection is that it is one or the other, is it not?

A. I will look the thing up, if you like, and tell you what I find out, but at the present time——

Q. No, you need not bother if you do not recall it, but I thought you had it in mind probably, having quoted the other. Now, let us take your testimony at page 2355. For instance, the Fall River Gas Company, Consumers' Deposits $429.85. You stated that all these things were carefully checked by you. I would like to have you point out to me in the report of the Massachusetts Gas Commission this item of $429.85.

See page 2357.

Mr. Burr: By the way, while he is looking for that, I want to call attention to a mistake on page 2357. The word on the fifth line, "liability," should be "variation."

2562 The Witness: That should be changed from "Consumers' Deposits" to "Interest Accrued But Not Due."

Q. Well, but you have not any item for any of these companies, "interest accrued and not due."

A. No, but I say in that case it should be.

Q. What are consumers' deposits, then?

A. Shall I read the whole of the liabilities to you?

Q. Oh, no, I merely said that I could not find consumers' deposits, $429.85. Now that was an error, wasn't it?

A. It was, I suppose, a stenographic error.

Q. Well, it was an error, no matter what kind of an error. What are consumers' deposits?

A. They do not appear in this. Apparently there are none.

Q. What about $2,193 next above in the Massachusetts report, deposits, $2,193?

A. On what page?

Q. Page 52, Roman lettering, of the Massachusetts Gas Report.

You say there are no consumers' deposits. Don't you find on page 52 of the Massachusetts Gas Report, under the head of Fall River Gas Company, deposits $2,193?

A. Yes. That should have been added. That, however, is an allowance which I should have had and did not get in.

Q. Well, whatever it is, that is another proposition. The fact is that $429.85 is an error and it should have read $2,193.00, (see statement p. 2355) is it not?

A. Yes, it is so much against my figures.

Q. That is all argument, Doctor. If you will just answer the questions and not argue each one, I think we will get along faster. What is the difference in your mind between floating and fixed liabilities?

A. Well, that is one that is not very clearly defined. A floating liability is in the nature of something which may be called up at any time for payment or within a very short time for payment, while a fixed liability is a liability under the form of a bond which has a definite time of payment and perhaps very long-term notes or something of that sort. 2563

Q. Well, you know that railroad companies and gas companies and other companies do raise capital that they use in their business by the use of notes, don't you, sometimes short term and sometimes long term notes?

A. Yes.

Q. Which are subsequently paid off or are funded into bonds, or what you might call fixed indebtedness of that character. That is quite common, is it not?

A. Recently it has become quite popular.

Q. Now, don't you know it may be called a regular practice pursued by the Massachusetts gas companies, or many of them, to issue notes to procure capital that they require, and subsequently to apply to the Gas Commission for leave to put them into the shape of bonds or stock?

A. That is not an unusual practice anywhere. I am not familiar particularly with Massachusetts.

Q. But under the Massachusetts statutes, bonds or stocks may be issued, may they not, only by consent of the Gas Commission?

A. Fortunately, yes.

Q. So that it is a common practice there, is it not, for companies to issue notes for capital that they require and run the liability in that shape, and subsequently fund it into bonds or stock by consent of the Commission?

A. I have no reason to differ with you.

Q. Now you have said in your testimony that the total amount of the Consumers' Deposits, Notes Payable and Unpaid Bills of these four companies in Massachusetts was $852,249.94. And you have subtracted from this floating liability $637,165.66, leaving only $215,084.28, which you have considered working capital?

A. Pardon me, the active capital.

2564 Q. Active capital?

A. Furnished by the stockholders.

Q. Well, I understand; it is furnished by the stockholders, we will say. But is not capital which is procured on notes in the market for the purpose of the operations of the company and used in the business of the company working capital just as much as though stock was issued and the money was put in by the stockholders?

A. It is undoubtedly a working capital required by the business, but it differs in its characteristics from the permanent active capital furnished by the stockholders who are not in a position at any time to demand its return.

Q. That may well be. But assume that a company requires a million dollars in cash working capital and instead of issuing a million dollars in stock and taking the money from the purchasers of the stock, it issues a million dollars in notes and borrows that money from banks on the open market. Is not that working capital equally as much, whether it came from one source or the other, so long as the company retains it and uses it in its business?

A. It is money used for working capital, but not money invested by the stockholders as active capital for the purposes of the company.

Q. But it is money invested in such a way that the company is entitled to a return upon it, is it not, because the company has to pay for the use of the money that is procured, whether it procures it from the stockholders or a bank?

A. I have but related the facts as shown in the accounts of these companies given to the Massachusetts State Commission, and to me it appears to be money borrowed, rather than money invested.

Q. But, Doctor, you have gone further than that and have made these deductions and have taken the $215,084.28 which is left and have said that that represents only 13 cents per thousand feet
2565 of active capital, and have then taken that as a basis upon which you have allowed the Consolidated Gas Company $1,726,000.00 of cash active capital beyond its plant, instead of the $4,000,00 which Dr. Humphreys testified was correct. Now I am asking you whether these deductions are proper, and for that purpose I am asking you whether the money which is borrowed on notes payable and which the company has to pay for and which money is used in its business, is not active or working capital or asset, whichever you please to call it, just as much as though the stockholders themselves had furnished that money and stock had been issued for it? Now, won't you give me an answer to that directly? Is it not?

A. It is, from my point of view and as related in the accounts, money borrowed.

Q. Yes, it is money borrowed as related in the accounts, but that is not the question. Won't you be good enough to answer my question?

A. The question should more properly be answered by the officials of these companies as to the point of view from which they regarded this money borrowed. Anything on my part would be a theory.

Q. It is not the officials of the company who have deducted those notes payable from the total of $852,249.94. You have deducted that upon some theory. I do not care what the theory of the officials of the company is. I want to ask you whether that is not just as truly active working capital, when it is furnished by a bank and borrowed on notes and is actually used in the business of the company, as though it had been furnished by stockholders and stock issued for it? Now, won't you answer that, either yes or no, is it not capable of such an answer?

A. No. I can explain, if you wish me to qualify it.

Q. Is your answer no?

A. With a qualification, which is at your service if you desire it.

2566 Q. Very good, go ahead if you will, Doctor, and explain.

A. In taking up the Massachusetts companies I have related but the fact as to what the Massachusetts gas companies spoken of have found necessary in the form of active capital subscribed by themselves to conduct their business, and that amount is $215,084.28, slightly less, I presume, by about $2,000, owing to an oversight in the Fall River Gas Company, making in round figures $213,000.

Mr. **Burr**: When you refer to the oversight in the Fall River Gas Company, you mean the item of $429.95 which should be $2,193, of Consumers' Deposit?

A. I do. That is what is demanded by the necessities of the case, and what these gentlemen, knowing their business thoroughly and undoubtedly working it to the uttermost profit that they can reach, have been forced to put up.

Q. I will ask you again, Doctor, assuming that a company has a plant ready to operate or in operation and that it requires a million dollars of cash in addition as a working capital, and it issues its notes payable and procures that one million dollars from banks or on the market, for which it pays, is not that working or active capital employed in the business of the company, assuming those facts to be true?

A. It is impossible to answer a question that is a generalization. I can answer it specifically and have done so.

Q. I am putting a hypothetical question and will ask you to answer the hypothetical question. We will assume that a gas company in the town of A has a plant that is in operation, that it has no cash on hand sufficient for working capital; that it requires a million dollars reasonably for that purpose and that it borrows one 2567 million dollars by its notes payable and runs those notes payable along from time to time as it pleases, and that it pays interest on that million dollars, and that it uses the million dollars necessarily in the operation of its plant as working capital; is not that million dollars, then, working or active capital upon which the company is entitled to earn a return?

A. That, of course, is purely an academic discussion of a theory which is not realized in practice, as shown in the case of these Massachusetts gas companies; but, I presume, being answered as a baseless theory, it might be called a theoretical working capital.

Q. Now, Doctor, is it not the use that is made of money in the business of a gas company or the question whether it is necessarily or reasonably used in the business of a gas company, which makes that working or active capital, and not the source from which the money is derived?

Mr. Burr: Do you refer to consumers' deposits?

Mr. Mathewson: I have asked him a question which I think is perfectly clear.

A. Will you kindly read that question over?

(Question read by stenographer.)

Q. Is not the governing factor, in other words, the use that is made of the money, and not the source from which it comes, which determines whether it is active capital or not?

A. In the case of an individual——

Q. Will you not answer in the case of a gas company? That is what I am talking about.

A. Or as differing from the case of a corporation, it might be called working capital; but the thought evidently conveyed by working capital in the case of a corporation is the amount of
2568 money found necessary to be raised through stocks or bonds
for the general uses of its business.

Q. I am not talking about the paper or the form of the paper that is issued as evidence of the money received; I am talking about the money as an asset. Is not the question of whether the money is an asset upon which the company is entitled to earn determined by the use which is made of the money received or its necessity to the company, and not by the source from which money is received?

A. The company is justly entitled to earn upon the balance which occurs between the money that it obtains from the sources shown on page 2355 and the amount that it appears to have obtained in the form of cash by other means. The company is not——

Q. Well, if it requires to use then the amount, and does use its consumers' deposits, the amount received from notes payable and the amount represented by unpaid bills in its business necessarily, then they are part of the assets of the company upon which it is entitled to earn, is that not correct?

A. Kindly read that question.

(Question read by the stenographer.)

The Witness: Kindly read that again.

(Question read by the stenographer.)

The Witness: No.

By the Master:

Q. Now that is what I want to know. Why not?

A. If a company can defer the payment of a bill for meters for an indefinite length of time, and it very frequently is done where its credit is very good, it certainly is not entitled to earn a profit on money which it has not paid, even though the amount of the
2569 meters appears on the books, as it naturally would be put
there on the receipt of the invoice.

By Mr. Mathewson:

Q. Well, we will eliminate unpaid bills, which amount to a trifling part of this $852,249.94, to wit, $13,580.92 plus $8,270, and I ask you the same question as to consumers' deposits and the moneys received from notes payable?

A. Referring particularly to consumers' deposits, this is of the nature of an insurance fund of very great value indeed to the company, particularly where there is, as in some cases, a very large amount of unreliable consumers. It is this insurance which they get from it that should more than compensate them for any interest which they may pay on it.

Q. In other words, they ought to pay interest on consumers' deposits, and not be permitted to earn on the deposits that they hold. Is that your theory?

A. Well, it may not be—in a general way, I should say yes.

Q. Then if the amount of money which the company received from the consumers as deposits is used by it as working capital the company is not entitled to earn anything on those consumers' deposits, although it would have been entitled to earn, if it had procured the same amount of money upon its notes from a bank or the same amount of money from the stockholders by the issue of stock and used it in the same manner; is that your theory?

A. We have not had the opinion of an insurance man, an accident insurance man, for instance. The question of the payment of interest, say of six per cent., would depend entirely, taking for instance the case of the Consolidated Gas Company, on what amount,
if you had no consumers' deposits, some solid insurance com-
2570 pany would insure you against loss from all of your doubtful
consumers.

Q. That has nothing to do with the point. I say if you have a certain fund, we will say one million dollars in cash, which has been received by the company as consumers' deposits, and the company uses that one million dollars in cash as necessary working capital, is it your contention that the company is not entitled to earn anything on that one million dollars which it uses as working capital because it came from consumers' deposits, whereas they would have been entitled to earn upon one million dollars used in exactly the same way if it had been borrowed by the company at a bank or had been furnished by the stockholders of the company and stock issued for it? Now, that is a fair question and I think it is clear, and I will ask you if you will not answer it directly.

A. I will answer it very briefly. I regard it as an insurance fund and the interest on it as a premium.

Q. Then the company would not be entitled to earn in that event on the money that it used as working capital merely because it was really a fund which was constituted by consumers' deposits, is that right?

A. I could give you a concrete case, in the case of the Consolidated Gas Company, if you like.

Q. No, I don't want a concrete case. I am asking you what your opinion is, because it bears directly upon your testimony given here.

Mr. Burr: He has expressed his view as to that.

Mr. Mathewson: I think the Master will rule that I am entitled to an answer.

Mr. Burr: He already stated how he regards consumers' deposits in practice——

The Master: He may answer it.

2571 Mr. Burr: Will you read the previous question and answer?

(Question and answer read.)

Mr. Burr: That is a complete answer.

The Master: I think he can answer that question. It is a perfectly simply question.

A. Would you kindly ask me any question you please, Mr. Master? I am anxious to answer it.

Mr. Mathewson: I have asked a question of Dr. Marks.

The Master: The question that Mr. Mathewson has asked is perfectly plain, I think.

The Witness: It seems to me exactly the same question I answered before. That is the trouble with it.

Mr. Mathewson: It is a question calling for an answer yes or no.

The Master: It puts you face to face with the result of your previous answer, that is all.

The Witness: Will you repeat the question?

(Question read by stenographer.)

Mr. Burr: Insurance fund, you mean?

Mr. Mathewson: I did not say insurance fund. I said a fund.

The Witness: The company which should——

Q. Can you not give me an answer yes or no to that?

A. No.

Q. You cannot answer that?

A. It is not entitled to earn. Is that what you want?

Q. Yes. It is not entitled to earn?

A. It is not entitled to earn.

2572 Q. Then the company is bound to pay six per cent. to consumers and is entitled to earn nothing with which to pay that six per cent. Is that right?

A. Do you mean in this case?

Q. I mean in the case of the Massachusetts companies.

A. I don't know that they pay six per cent.

Q. Well, assuming that they do, what then?

A. It is not necessary for me to assume that they do.

Q. Yes, I think I am entitled to ask you, assuming that they pay interest on consumers' deposits, do I understand that they are not entitled to earn anything on that?

A. I should wish to know how much interest they have to pay on consumers' deposits before I answered that question.

Q. Assuming that they pay interest on consumers' deposits in Massachusetts, do I understand it to be your opinion that these four companies would be entitled to earn nothing on the deposits which they hold?

A. I had assumed that they did not pay interest, and if they did pay interest of a very considerable amount I presume some proper allowance ought to be made in the way of earnings.

Q. But if they use the fund as working capital, which working capital they would be obliged to procure from another source if they did not receive it from consumers' deposits, they would not be entitled in your view to earn on that working capital, is that right?

A. The question of earning——

Q. Can you not answer that question and say either yes or no to it, or in substance that? I want to get an answer and I am wholly unable to.

Mr. Burr: If you cannot say yes or no, explain it.

The Witness: Will you read that question, please?

(Question read.)

The Witness: Can you give me some concrete case?

2573 Q. No, I am asking you a question to test your theory. I am trying to find what your theory is about this?

A. I have no theory.

Q. You put one into execution in making your deductions here and I am testing it.

A. My deductions were for the purpose of obtaining the active working capital required.

Q. I think the Master will instruct you that I am entitled to ask a hypothetical question of that kind. If I am wrong, he will correct me and if I am right I will ask you if you will not answer the question over again?

Question read as follows:

"Q. But if they use the fund as working capital, which working capital they would be obliged to procure from another source if they did not receive it from the consumers' deposits, they would not be entitled in your view to earn on that capital, is that right?"

The Witness: What fund do you refer to?

Q. Does the question not indicate sufficiently? Will you read it again?

(Question read.)

Q. I refer to the fund constituted by the consumers' deposits that we have been talking about all the time?

A. Will you kindly read that question again?

(Question read.)

A. No.

Q. Well, would they be entitled to earn if they used it as working capital?

A. My answer was no.

Q. Then your view sums up as follows, if I understand you, that if a company receives consumers' deposits and pays interest

2574 upon them, it is probably entitled to earn something on the consumers' deposits to meet the interest, except that if it uses the consumers' deposits as working capital, in that event, it is not entitled to earn anything on the consumers' deposits to pay the interest, is that correct?

A. No, you have mixed that up very badly.

Q. I have.

A. Yes.

Q. I am inclined to think you have mixed it, because I have quoted you directly from what you said, that if the company received consumers' deposits and paid interest on them, that it would be probably entitled to earn something on them in order to meet the interest payable to consumers, *did* you not say that in substance a few moments ago?

A. What I undertook to say——

Q. Didn't you say that in substance?

A. What I undertook to say, and add to it, was that if it did not receive interest, it was entitled to consideration.

Q. We are assuming that it did receive interest, and you did say that then. Now, you say they are not entitled to earn anything on it, however, if it is used as working capital?

A. I beg your pardon. If there is no interest paid on consumers' deposits. I may not have made myself sufficiently clear.

Q. No, I don't think you did, if that is your explanation.

A. It is difficult to follow your questions.

Q. I am sorry. Then your view now is that if interest is paid on consumers' deposits, you are entitled to earn on the deposits by the use of the funds even as working capital, if the company requires capital, and is able to use the fund in that way, is that correct?

A. If you will give me any concrete instance and figures which I have stated, I will be glad to answer.

Q. No, I will not give you a concrete case, *will* you be good enough to answer the question? 2575

A. Will you read the question?

(Question read.)

The WITNESS: Where interest is paid on consumers' deposits, it should have consideration in the matter of earning.

Q. Well, the Consolidated Gas Company, it is in evidence, does pay six per cent. on consumers' deposits. Then so far as the consumers' deposits of the Consolidated Gas Company are concerned, it is entitled to earn on consumers' deposits, is it not?

A. Something less than the interest paid on account of the insurance effected.

Q. I will touch on that later, but it is entitled to earn on consumers' deposits whether it uses the consumers' deposits as working capital or uses them in some other way to produce an earning on such deposits, is not that right?

A. Apparently.

Q. Then, so long as the Consolidated Gas Company does have to pay, in making your computation as to the amount allowed to the Massachusetts Gas Companies per thousand, for working capital, which computation you made for purposes of application to the case of the Consolidated Gas Company of New York, ought you not to have included consumers' deposits instead of excluding them?

A. I made the comparison for the sake of the capitalization, confining myself solely to that matter of the capitalization, and not to the question of earning.

Q. You made your computation for the purpose of showing the amount of working capital beyond plant to which the Consolidated Gas Company was entitled, didn't you?

A. Exactly.

Q. And if it appears that part of the Consolidated Gas Company's working capital is consumers' deposits, then you should have 2576 included consumers' deposits in making the comparison in computing as to these four Massachusetts companies, should you not?

A. In the case of these companies?

Q. Yes.

A. Not necessarily, because I was relating the facts as to capitalization, and not as to earnings.

Q. But it does appear, does it not, and you state here that from the working capital, $852,249.94, you deduct floating liabilities amounting to $337,165.66?

A. You should add about $2,000 to that.

Q. And you define the total sum $852,249.94 as working capital?

A. Yes, but not the active working capital furnished by the stockholders.

Q. No, not furnished by stockholders, but working capital. I make no distinction in that regard, and don't think any is to be drawn. Now, as to your insurance fund, as a matter of fact you have made no question that the amount of bad debts of the Consolidated Gas Company is a proper charge against the operating cost of gas, have you?

A. The bad debts?

Q. Yes. You allow them as a proper charge against the cost of gas?

A. I have allowed those as all other accounts, as a doubtful matter.

Q. Oh, have you heretofore specified that the amount of bad debts is a doubtful matter to be allowed in estimating the cost of gas?

A. All of the items of Exhibit 94 are clearly classified, first, as those obviously to be rejected, and secondly, as those doubtful.

Q. All the rest are doubtful?

A. Yes.

Q. I see. Now, assuming that it is established that the bad debts did amount to the sum specified, and assuming that to be the fact, as shown on Exhibit 94, then you do not question the proposition that the bad debts of a company which it incurs in the pru- 2577 dent conduct of its business, is a charge against its operating cost, do you?

A. I presume if thoroughly satisfied of the proper and vigorous management of the company in the matter of debts, that any small residue of bad debts ought to be allowed to them.

Q. Don't you know, if you have read the testimony before the Stevens Committee and before the Gas Commission, that no witness, not even Professor Bemis, questioned the propriety of charging the amount of bad debts to operating cost of gas?

A. Under the conditions stated by me, I would do the same.

Q. Then, if the Consolidated Gas Company, or any other gas company, did not receive consumers' deposits or exact consumers' deposits, it would be quite likely, would it not, to increase the amount of bad debts which would be uncollectible?

A. I presume so.

Q. And in that event it would increase the cost of gas by the amount of those additional bad debts which would thus be produced, would it not?

A. I presume that there would be increased bad debts.

Q. Then this insurance fund, as you call it, that is the consumers' deposits, is as much to the advantage of the consumers of gas, in order to reduce its cost, as it is to the company; in fact, more so, if the amount of bad debts is to go into the cost of gas and the company is to be entitled to earn a fair return upon the cost of gas. Is not that a fair proposition?

A. Well, yes, it certainly is advantageous to insure themselves in every way, not only in the matter of bad debts, but also in the matter of buildings, and against all the accidents that occur.

Q. And any payment for insurance, in whatever form the corporation makes it, is a proper charge in the operating cost of its product, is it not?

A. Well, that depends entirely upon what the insurance is for.

2578 Q. Is there any question that the amount that the company pays for the insurance of its buildings is a proper charge in the operating cost of gas?

A. I recall an item of about $52,000 of insurance in Exhibit 94, unless I am very much mistaken, which appears to me to be an enormous sum of money for insurance.

Mr. Burr: And you remember that we called for the policies and they were never produced?

The Witness: Yes.

Q. We are assuming that the amount paid by the company for insuring its buildings is a proper and reasonable amount. Is there any question that it is entitled to include that payment under those circumstances in the price of gas?

A. It would appear proper in a properly managed company, carefully insured.

Q. Furthermore, is it not also true that if the company did exact consumers' deposits that not only would the bad debts be increased, as you have admitted, but that the cost of collection would probably be considerably increased as to the amount which the company did collect?

A. Of course one has to know—the difficulty which I have in answering you and I wish to answer you clearly—lies in the fact that you are putting hypothetical and not concrete cases. Taking the consumers' deposits here in Massachusetts you will find that they are all relatively very small apparently little difficulty arising from the collection of bills. And it may be and possibly it is true that in the $904,000 of the Consolidated Gas Company a sum is exacted out of all proportion to the doubtful and irresponsible consumers.

Q. That may or may not be true, but I do not think that affects
the proposition that we are now directing our attention to.
2579 Will you now tell me how the Gas Commission of the State
of Massachusetts regards notes payable such as you have speci-
fied for Cambridge, Fall River, Lowell and Worcester gas companies,
as part of the capital or not?

A. I don't know.

Q. Let us see if we cannot find out. Have you a copy of the report from which you have been quoting, and, if so, will you turn to page 116? There is a table from which you have taken the sales of gas which you have used in your computation, is there not?

A. Yes.

Q. Now, will you take the Cambridge Gas Company? What is stated under the heading: "Capital per thousand sales, including bonds"?

A. $2.52.

Q. Now, will you turn to the page of that report which shows the capital stock of the Cambridge Gas Company?

A. Will you give me the page?

Q. Page xxvi.

A. I have it.

Q. What is the capital stock of the Cambridge Gas Company?

A. It appears to be $880,000.

Q. Will you then add to that the amount of the notes payable of the Cambridge Gas Company which you name at page 2355 of the present record to wit, $225,000, and now will you tell me what the total of those two amounts is?

A. $1,105,000.

Q. Now will you divide $1,105,000 into the amount of sales for Cambridge, to wit, 439,162,251 feet shown on the table at page 116 of the report and see whether that does not give the $2.52 with which we started?

A. I am perfectly willing to accept those figures as their statement of gas sales.

Q. Yes, but I am asking you if you won't divide the amount of sales by the $1,105,000 which includes both the capital stock and the notes and see if the result is not $2.52 with which we started?

A. The total gas bill is given as 439,162,000, is that it?
2580 Q. Yes, 439,162,152 feet, to be exact. I ask you to divide
the total amount of $1,105,000 by the sales?

A. It appears to be about $2.51 here.

Q. Well, $2.52 about.

A. Yes, $2.51 and something over.

Q. If you want to compute it over again and see if it is $2.52; please do so.

A. Well, it is near enough that way.

Q. All right. Then it appears that the Massachusetts Gas Commission must have included this $225,000 of notes payable of the Cambridge Gas Company that you state at page 2355 as part of the capital of the company in order to get the result $2.52 per thousand feet of gas sold at Cambridge, does it not?

A. It would appear as if they called the notes payable bonds drawing interest, from that computation.

Q. In other words, they would include it under the title, "Capital including bonds"; that would be it, wouldn't it, because $2.52 appears under the caption, "Capital per thousand sold including bonds"?

A. Of course, they have made an error in their statement here and there maye be—I have not had a chance to look into the figures thoroughly—and there may be an error on their part in figures as well as in words.

Q. Oh, but this is the Gas Commission's report from which you have been making all your computations? You do not assume that is error, do you?

A. Indeed, they are very fallible.

Q. Then it is too bad you use it and compel us to take all this time.

A. It is the best I could get.

Q. Now, take the Fall River Company under the head of "Capital per thousand sold, including bonds," at page 116 of the Massachusetts report, and you find, do you not, $2.54?

A. $2.54; yes.

Q. Now, look at page 52, Roman, in this report, and state what the capital stock of the Fall River Company is.

A. $635,000.

2581 Q. Will you now add to that $635,000 the amount of notes payable which you have specified for the Fall River Company at page 2355 of the present record, to wit, $180,000, and say what total that gives?

A. $815,000.

Q. Will you now be good enough to divide the $815,000 by the gas sales which appear at page 116 of this report, and which you have used, to wit, 321,119,341 feet, and see if it does not give $2.54 as a quotient, being the figure with which we started?

A. It would appear to me in both of those cases of the Fall River and the Cambridge Gas Companies that the Massachusetts Gas and Electric Light Commission or the statistician had included notes payable without so saying under the tabulation on page 116. Now it does not necessarily follow that that is any more than their opinion or the opinion of the statistician.

Q. It purports to be the 21st annual report of the Board of Gas and Electric Commissioners of the Commonwealth of Massachusetts, doesn't it?

A. Yes.

Q. You don't find anything there about it being the report or opinion of the statistician, do you?

A. No, but I happen to be aware of that fact.

Q. Have you any reason to suppose that that method of computation and the inclusion of these notes as part of the capital of these companies is not the judgment of the Commission?

A. I take it for granted that it would not call notes payable bonds if they were aware of that fact.

Q. You think, then, that for years and years they have pursued this course, having been deceived by their statistician, and have computed year by year the amount of capital per thousand feet sold without ever having discovered that the notes payable were included as part of the capital of the company in making that computation, is that what you suppose? 2582

A. I have no opportunity to form an opinion on that elaborate statement of yours.

Q. You formed an opinion a moment ago, when you said you thought that it could not be aware that the notes payable were included in the capital. Now, do you really mean to say that you think the Gas Commission of Massachusetts are not aware that the notes payable are included in the capital of the company by them?

A. I have no basis on which to form an opinion.

Q. Well, then, I would not express one to the contrary. Now, by taking the Lowell Company and the Worcester Company in exactly the same manner, I have made a computation which discloses that $75,000 of notes payable of the Lowell Company shown at page 2355 and the $95,000 of notes payable of the Worcester Company shown at page 2355 of the present record are also included under the capital of the company, pursuing exactly the same method. Do you wish to compute that, or are you willing to take my statement of it and verify it?

A. For the present it is not worth while losing time; it is obvious in two cases that that has been done.

Q. Well, I state I have made a computation in exactly the same way, and find in exactly the same manner that those notes payable have been included in the capital by the Commission, as relating to the Lowell and Worcester companies.

A. Yes, I will look it up later, at some other time.

Q. And if you do not hear to the contrary, you will accept our statement as a fact, will you?

A. Why, yes; certainly, if I don't find anything further.

Q. Now, we will disregard the question of consumers' deposits and unpaid bills for these four companies, and I will ask you how much of the $852,249.94 remains as working capital after deducting consumers' deposits and unpaid bills and leaving only the notes payable? In other words, the same result would be obtained by adding to the $215,084.28, which you found to be the balance—— 2583

A. Would it be satisfactory to you to add together the notes payable?

Q. Yes, any way you please. Add those, and add that to the $215,084.28. That is a short way of getting it.

A. That seems to be about $575,000.

Q. Well, will you now add that to the $215,084.28 active capital that you specified on page 2355 of the present record, in which you did not include these notes payable?

A. That appears to be $790,084.28.

Q. Now, will you be good enough to divide this total of $790,-

084.28, which appears to be the active capital recognized by the Boston Gas Commission, by the total annual sales of 1,653,012,000 feet of these four companies?

A. Would $0.48 be near enough for you?

Q. Yes, that is near enough; it is a trifle below $0.48. Now, if you include these notes payable, as the Massachusetts Commission does, would it show an active capital not of thirteen cents per thousand, but of forty-eight cents per thousand? And will you multiply those forty-eight cents by the output of the Consolidated Gas Company, 13,283,164,000 feet, and say what working capital it would produce for the Consolidated on that basis?

A. Do you mean working capital or capitalization?

Q. Whichever you meant when you applied the thirteen cents the other day?

A. I meant the capitalization allowable.

Q. Very good.

A. Do these figures coincide with those—$6,375,918?

Q. My figures on this are a little less than that. It is about $6,350,000. I think you had better perhaps make your——

A. I took——

Q. The total is $6,375,918.52 as you figure it?

A. Yes, sir.

2584 Q. Was that including the notes payable which you denominated at page 2356 of the present record as "Active Capital Furnished, or Quick Assets" would be $6,375,918.52 in place of $1,726,811.32, upon that basis, is that right?

A. No, it would be that the working capital to correspond *pro rata* with the views of the Massachusetts Gas and Electric Commission would be $6,375,918.52, and not the active capital furnished by stockholders.

Q. Well, whichever you please, I don't suppose you know, Doctor, whether these notes payable represent monies advanced by stockholders or monies advanced by other people?

A. Banks.

Q. But you have no information in this regard particularly?

A. Only casual information in regard to the banks. I have heard the remark made that banks are very glad to furnish money to gas companies.

Q. Oh, they always are if they get good security, even to the Consolidated Gas Company; but as the Massachusetts Gas Commission permits the issue of stocks and bonds only for established expenditures or expenses which have been or can be certainly computed, you know, do you not, that the companies there get their money on notes payable very largely, and then apply to the Commission after they have determined the amount required and have obtained it to put it into the shape of stocks and bonds, and in that event it would be more probable, would it not, that the stockholders would advance the money than it would be if they did not expect to convert it into stocks and bonds later by consent of the Commission? If you are indulging in assumptions, wouldn't that be a fair one?

Mr. **Burr**: I do not think that is an assumption worth while wasting time on. I think it is the merest kind of guessing.

2585 Mr. **Mathewson**: I don't know that I shall dispute it. I don't know that it makes the slightest difference.

Q. Now, in your original affidavit on the motion here you included in a somewhat similar computation not only these four Massachusetts companies but also the Brookline company, which is one of the Boston or Metropolitan Gas Companies, did you not?

A. Referring to my first affidavit?

Q. Yes.

A. On page 16?

Q. I merely ask you whether you did?

A. I included the Brookline Gas Company.

Q. I suppose you have read the rebutting affidavit of Mr. Addicks?

A. I have.

Q. In that affidavit, at page 44, he called attention to the fact that in the case of the Brookline Company you had entirely omitted part of the capital, to wit, outstanding bonds and other capital obligations amounting to over $2,000,000, exclusive of capital invested in the electric plant belonging to the company, and that the capitalization of the Brookline Company, which is one of the five companies that you mentioned operating in the City of Boston, under metropolitan conditions, was equal to $4.60 per thousand feet of sales instead of $2.18, as stated by you. Did you make an examination and discover that $2,000,000 to which he referred?

A. It was a case in which I was discussing the dividends on capital stock regardless of other matters, and the result of taking their capital stock and dividing it by the annual gas sales in cubic feet was $2.18. It was for the purpose of considering dividends only on stock and average rates of dividends in Massachusetts.

2586 Q. But didn't you in that computation omit any consideration of this $2,000,000 to which he calls attention?

A. Do you mean the $2,000,000 in bonds?

Q. Yes.

A. I purposely omitted that. It had nothing to do with dividends on stock.

Q. Doesn't it have something to do with the amount left for dividends whether you pay interest on bonds or not?

A. I was simply citing facts as precedents in Massachusetts.

Q. Have you a copy of the 1905 report of the Massachusetts Gas Commission?

A. Yes, but I think those figures are from 1904, if you wish that.

Q. You did not include in the capitalization in determining how much per thousand feet that represented in the case of the Brookline Company, then the two million dollars which the Massachusetts Gas Commission apparently includes in the capital?

A. No, I did not.

Q. Have you any doubt, if that were included, the result would be $4.60, as specified by Mr. Addicks, or haven't you computed that?

A. I did not compute that, because Mr. Addicks misunderstood the object of my figures I found, and it was merely to take the amount of capital stock and show the dividends, rate of dividends on it, which in this case happens to be ten per cent.

Q. Was your purpose then merely to show in this table at page 16 of your affidavit the amount of assets per thousand feet which was represented simply by share capital, excluding entirely bonds and other forms of capital?

A. On page 24 of the appendix, Roman numerals, for 1905, Massachusetts Gas and Electric Light Commissioners, under the head of liabilities, is "Capital stock, two million dollars." This is reported by the company themselves.

Q. Oh, yes, capital stock; that means share stock, you understand it?

A. That is what I was seeking, the term.

2587 Q. Now, considering the fact that some gas companies have outstanding perhaps all capital stock and no bonds, and other companies have outstanding a small amount of bonds and a larger amount of capital stock, and still others may have outstanding a substantial amount of bonds and a small capital stock, the securities in each case representing the assets of the companies, do you think it is valuable to show how many dollars per thousand feet of cost is represented by capital stock only as distinguished from all capital obligations such as stocks, bonds and notes payable?

A. When ten per cent. dividends are under discussion, which was the case here, that was the object.

Q. That was the sole object, then, of this table?

A. It was the principal object.

Q. It would make a great difference, would it, if half of the capital of the company were in the shape of bonds and one-half in the shape of stock, as to the amount of earnings that the company would be permitted to make upon its assets as compared with a company all of whose assets were represented by the capital stock?

A. You mean the rate of dividend?

Q. I said the earnings of the company.

A. Will you repeat the question?

The STENOGRAPHER (reading): "It would make a great difference, would it not, if half of the capital of the company were in the shape of bonds and one-half in the shape of stock as to the amount of earnings that the company would be permitted to make upon its assets, as compared with a company all of whose assets were represented by capital stock?"

A. Permitted by whom?

2588 Q. Oh, permitted by the Legislature, or by the Commission, or whoever might have it in charge. In other words, assuming that a company has assets or investment of a certain amount, or that two companies have investments of exactly the same amount in the gas business, are you going to determine the amount of earnings that the company is going to be permitted to make on its investment, by seeing how much of those assets are represented by capital stock and how much by bonds in each case?

A. Were I to determine the earnings or profits of a company, I should pay no attention to either the stock or bonds. I would find out the actual structural cost, and put a fair profit on that.

Q. Precisely. Then, we have no dispute on this, that the actual value or actual structural cost of whatever may be the proper basis to proceed upon is what we have got to take in determining the return which a company is entitled to, and not the amount of paper it has outstanding or the shape of that paper?

At this point, 1:00 p. m., a recess is declared to 2:15 p. m.

2589 After Recess.

William D. Marks resumes the stand.

Cross-examination by Mr. **Mathewson** (continued):

Q. Doctor, in getting your $2.18 per thousand feet for the capitalization of the Brookline Gas Light Company, in your affidavit you say you took merely the share capital stock for a divisor. Do you know that part of the property of the Brookline Gas Light Company was an electric plant, which appears by the report of the Gas Commission to amount to six hundred thousand or seven hundred thousand dollars?

A. Not only did I know that, but I also knew the fact that it largely produces gas, and for that reason left out the dividend per thousand, not including it in the computation.

Q. Yes, but in getting your $2.18 you divided by the entire share capital stock and not by a portion of it, didn't you? I am simply talking of the share stock capital, whether you did not divide by the entire amount of the outstanding share capital of the Brookline Company, to get even your $2.18 you divide by two million dollars, that was the entire outstanding capital?

A. Yes. I did so and then made no further use of it, as you will observe, because I had not given the dividend per thousand cubic feet, except that afterwards in adding up, $2.18 being the largest, with the exception of the Lowell Gas Light Company, I added it in to give good measure in the average.

Q. You did not give any data as to capitalization per thousand of sales or capitalization or assets per thousand of capacity relating to the Boston Consolidated Gas Company did you?

A. I did not.

2590 Q. Do you remember the testimony of Professor Bemis before the Gas Commission that the conditions in Boston were more nearly like those in New York than any other large city?

A. Are you referring to the Boston printed testimony?

Q. I am referring to the testimony before the Gas Commission which you say you read?

A. In Boston?

Q. No, the Gas Commission in New York. Don't you recall my asking him that question and his replying in substance as I have stated?

A. I would not answer definitely on that point because I probably would not really be much affected by a general statement of that sort, a statement made by anybody.

Q. But you do know that Professor Bemis testified in 1905 and 1906 in the Boston Investigation and that he testified there previously, and that he made a careful study of Boston conditions, do you not?

A. I have been so informed.

Q. And wouldn't you consider that his statement if it was made to the effect that the conditions there were more similar to New York than conditions in any other large city with which he is familiar would be entitled to some weight?

A. Why, yes.

Q. Now, as a matter of fact, the Boston Consolidated Gas Company has several plants or stations representing their original companies, hasn't it?

A. Yes.

Q. In that respect it is very similar to New York, is it not?

A. Well, I cannot say because I have made no study of it.

Q. Don't you think that would be more nearly a similar condition to New York than it would be to take four widely separated companies like Cambridge, Fall River, Worcester and Lowell?

A. As to what?

Q. As a comparison with New York?

A. As to what particular?

2591 Q. As to the comparisons which you made?

A. You mean in actual structural cost?

Q. Yes, in comparisons which you made.

A. In the actual structural cost where accessible I would have been very glad to have taken the matter up if I had had the time.

Q. But you say you read the testimony before the Gas Commission of New York and all those figures as to the cost appear there, do they not?

A. No, not in such detail as given by the Massachusetts Commission.

Q. Well, you know the Corporation Counsel of the City of New York, with whom you are conferring, has the entire record of the testimony in Boston before the Gas Commission there, as well as in relation to the Boston situation, do you not?

A. I do.

Q. Do you know that an appraisal of the property of the Boston companies was made about 1904 or 1905 by experts, the city having a representative present, as Professor Bemis testified?

A. By what expert, may I ask?

Q. I didn't say. I said by experts.

A. I do not.

Q. You didn't know that any appraisal of the property of those companies was made preliminary to the consolidation which the legislature authorized?

A. I knew that an appraisal was made.

Q. Isn't it a fact that the appraisal referred to the valuation of property, the amount running to something like twenty-four millions for the Boston companies?

A. Appraised by whom?

Q. The appraisal to which I have referred in 1904 and 1905 preliminary to the consolidation—there was only one that I know of.

A. I should like to know who made it.

Q. Well, I cannot gratify you at the moment. I merely ask you the question.

2592 By the MASTER:

Q. It is not a question whether or not that was a correct appraisal. It is simply whether or not you knew an appraisal was made at or about that amount.

A. An appraisal was made or claimed to be made in Boston.

By Mr. MATHEWSON:

Q. And don't you recall or isn't it your information that the amount of that appraisal was about twenty-four million or twenty-five million dollars?

A. Am I at liberty to ask by whom?

The MASTER: It does not make any difference; that is not the question. It might have been made by me or anybody.

A. Not the accepted appraisal.

Q. Will you answer my question?

A. There was no appraisal accepted by the parties interested giving a value at twenty-four million or twenty-five million dollars.

Q. Will you look in the report of the Massachusetts State Board of Gas and Electric Light Commissioners at page 20, Roman, and see whether the total assets as per the books of the company do not appear there at $24,366,520.14 exclusive of a profit and loss balance of $79,053.11?

A. I see the following paragraph:

"Total assets as per books of the Company $24,366,520.14."

Q. That is the same kind of an account, isn't it, and presented in the same sort of a form as the statement of assets of these other companies, Cambridge, Fall River, Lowell and Worcester.
2593 respecting which you have testified from this same book?

A. Apparently.

Q. Well, now it appears that there are a few electric items there, which you will observe. Altogether they do not amount, do they, to more than a few hundred thousand dollars, if you will run your eye down them, certainly of less than a million dollars? My calculation is that deducting that the balance is $23,501,113; is that substantially correct?

A. That would appear about it.

Q. Now do you know what the sales of the Boston Consolidated Gas Company or of the constituent companies of which it is composed were at the time of the consolidation?

A. I could not give those without referring to the statement made of the investigation.

Q. Isn't it your recollection of the examination of the testimony before the Gas Commission and from Professor Bemis' statement that the sales were about three billion feet at that time?

A. I have a very clear recollection of Mr. Addicks making that statement, that is was three billion feet.

Q. If that be true, then this $23,501,000 would represent assets of nearly $8 per thousand cubic feet of sales, would it not?

A. Yes, I should say about that.

Q. And will you look now at page 114 of the Massachusetts Commissioners and say what the daily capacity of the works of the Boston Consolidated is stated to be?

A. 28,000,000.

Q. I think, Professor, that that includes the capacity of the New England Coal & Coke Company which does not put out any gas, but waiving that for the time being and assuming that capacity to exist would it be indicated as to assets per thousand feet of capacity upon the same basis as you testified as to the four other Massachusetts companies?

2594 A. That is, to divide by sales of gas, do you mean?

Q. Well, the same way you have computed with reference to the other four companies. You have the same data in reference to the Boston Company exactly as you have with regard to the other four companies.

A. I have not got the structural assets for the Boston Company out. I refer to page 2,351.

Q. Well, what do you include in the term "structural assets," if I understand correctly?

A. For instance, on page 2,349, real estate, machinery and manufacturing appliances, street mains, meters and office furniture.

Q. I see.

A. I can work that out if you give me all the time that is required.

Mr. Burr: Work it out.

The Witness: I have run it through and make it $22,632,663.09. I have taken one-half of the office furniture and one-half of the printing plant as justly chargeable to the gas as well as to the electric plants.

Q. I think that is a little excessive, in view of the fact that the electric assets are a mere fraction of the total business, but go ahead on that basis and we will see where we come out.

A. Making the computation as you request, the result is as follows:

Real estate for gas	$6,750,000.00
Mach. & Mfg. Apparatus	4,430,790.52
Street mains, gas	9,003,050.77
Services	1,250,210.59
Meters	1,177,210.17
Office Furniture (½)	17,897.85
Printing Plant (½)	3,503.19
Total	$22,632,663.09
Daily capacity stated	28,000,000.00

2595 Dividing this 28,000,000 into $22,632,653.09 you obtain $808.31. The apparent result from these figures, cost per thousand daily capacity $808.31, dividing by the capacity factor of apparent cost per annual cost, is $4.04.

Q. If you divide by all the gas assets instead of only by those which you have taken, I figure the capitalization per thousand of gas assets including horses and wagons and cash on hand and other items to be $4.20. Would that be pretty close to the facts, or do you wish to compute that?

A. I can compute that if you wish.

Q. Well, just as you please. You can verify it if you wish. You have already figured out the amount deducting the——

A. I am trying now to figure for you the active capital.

Q. Yes. Deducting the electric items.

A.—

Due for gas	$41,599.29
Gas Coal on hand	53,045.87
Coke on hand	4,901.27
Tar on hand	17,803.49
Enrichers	39,540.74
Purifying Material	16,892.75

Q. The next item, Other Gas and Electric Materials includes both, but I know of no other way than to take the proportion of that item which electric assets bear to the total assets or to gas assets?

A. Well, the amount of electric material on hand in an average station unless very well cared for amounts to considerable.

Q. Yes, but you must remember these are very small stations compared to the gas. You can assume any proportion you wish.

A. Have you any idea of the horse-power of the station?

Q. The capacity is 1,950 kilowatts.

A. Well, about $25,000 worth of material would be a proper allowance for about 2,500 horse-power.

2596 Q. Supposing you take $200,000 for the gas material. That will leave you $26,773.38 for the electric.

A. Stoves on hand $270,000. Horses, wagons, etc., would practically all be for the Gas Company I think.

Q. Yes, I think so.

A. $24,004. Total rated horse-power of the boilers is about 1,375 and engines 3,150; $26,000 is as near as you can guess, with the loose material lying around. Horses, wagons, etc., $24,004.

Q. You have given that.

A. I put all those down, but there may be a horse or wagon or two for the electric company. Sundry accounts due the company, how would you divide those?

Q. Well, the operating expenses for gas during that period were $92,000 and for electricity $3,900. It is only thirteen days, you see. What do you assume that to be?

A. Sundry accounts due the company.

Q. Yes.

A. I left you to figure on that. I put down about $17,500.

Q. Very good. Just say, assumed $17,500.

A. Out of about $20,000 is it not?

Q. I should think that would be possibly about fair.

A. Now, with regard to cash on hand.

Q. Well, that would be the same basis as the accounts due probably, one-eighth you took of the accounts due, substantially. Suppose you take one-eighth of the cash on hand for the electric.

A. That would leave about $110,000.

Q. Yes, I should think so.

A. Insurance. I have taken all the insurance since I left it out of the other one—I beg your pardon, I had no right to put in the office furniture at all. We are talking now about the active assets. We have no right to put in the horses and wagons.

2597 Q. Oh, yes. My question contemplated those if they are used in the gas business. You are proceeding on exactly the basis my question contemplated.

A. Well, the office furniture ought not to have gone in?

Q. Yes.

A. No, it went in in this case, you will observe, in the fixed or structural assets.

Q. Oh, yes. Very good. You put in the office furniture then at one-half of the amount. That amounts to it finally, doesn't it?

A. Well, that goes up against the electric plant, if we choose to take that up. Cash on hand $110,000, leaving $15,000 for the electric plants. Insurance, I don't know how to treat that, I don't know what to make out of that exactly.

Q. Well, omit it entirely. Omit the insurance entirely and put in the whole either of the printing plant or the furniture for the gas, and that will probably adjust it.

A. The printing plant I had already inserted, you will observe, one-half, as a fixed asset, so I suppose we had better omit that and foot this up.

Q. Very good.

A. I may be wrong but I have added it once and it appears to be $795,287.41.

Q. Added to the $22,632,663.09 would give you how much?

A. Do you wish me to treat this in the same way you did those?

Q. Yes. In other words, you figured $4.04 on the capacity, taking certain items. Now, will you take all the gas assets and say how much it is. It will be something over $4.04?

A. You wanted me to add that in?

Q. I understand, in the case of the other four companies, your computation simply took in as assets the real estate, machinery, manufacturing apparatus, street mains, meters and office furniture and works in process.

A. Do my figures check yours, $795,287.41?

Q. Yes.

A. Carrying that out, which is merely checking your computation, apparently $4.18.

2598 Q. Referring to your computations at page 2,351 relating to the other four Masaschusetts companies, of course, if you had included in the assets there, the cash on hand, horses and carts and other items of assets which you excluded, the assets per thousand feet of sales or capacity would have been somewhat larger than you specified at page 2,351 of this record, would they not?

A. Yes. You are referring now to Cambridge, Fall River, Lowell and Worcester.

Q. Yes.

A. Yes.

Q. Now, you have referred to the Boston appraisal not being accepted, which leads me to ask you whether you do not understand that the consolidation of the Boston Gas Companies was made on the basis so far as the statute was concerned, allowing the consolidation of the outstanding stock and bonds amounting to $15,124,600.

A. All that I know about it I have seen in the printed copy that was handed to me through the kindness of the Corporation Counsel.

Mr. Mathewson: In this connection, I offer in evidence Exhibit 169 before the Gas Commission, being the Act of the Massachusetts Legislature permitting the consolidation of the Boston Gas Company, Chapter 421 of the Acts of 1905, showing exactly the terms of the consolidation.

Received in evidence and marked Complainant's Exhibit 256.

Mr. Mathewson: In passing, I call the attention of the Master to the capitalization fixed stated to be the face value of the outstanding notes and bonds or certificates of indebtedness as of October 31, 1904, to wit: $15,124,600 which was the authorized capital of the new company, and the following provisions:

2599 "The Boston Consolidated Gas Company shall not, by the acceptance of the capitalization herein authorized, be deemed to have admitted for any purpose that the par value of the capitalization is equal to the value of its property or to the value of the property necessary for the proper conduct of its business."

Q. Now, assuming Prof. Bemis' testimony before the New York Gas Commission at page 1,441 to be correct when he states that the output of the Boston Consolidated Companies for the year ending June 30, 1904, was about three billion feet of sales, that would indicate even under the capitalization fixed by the Act something more than $5.00 per thousand on sales, would it not?

A. If you wish me to make the computation——

Q. Well, merely in your head?

A. It is about 3,000 M. divided into 15,000,000 gives about $5.00. Of course I am merely serving you as a computer in all these instances. It is not my opinion.

Q. I understand, and I am much obliged to you for your courtesy in computing. Not being a land expert, I suppose you don't know whether land in Boston is as expensive as in New York or not?

A. I do not.

Q. In answer to one of my questions on page 2,448 of the present record, you stated, according to the record, the net profits of the New York Consolidated Gas Company would be greater in 1907 than in 1905 on the basis of a price of $1.00 per thousand cubic feet in 1905 and one of 80 cents in 1907. Is this statement correct, even under your estimate of sales in 1907?

A. If you assume the same cost in 1905 and also in 1907 you will have the same net profit on each thousand feet if the price is kept constant. If, however, you differ in the price by 20 cents the net profit will be cut by this amount in 1907 as against 1905.
2600 There would be some compensation in the reduced cost of distribution, and it appears to me in the possible reduced cost of manufacture, but I am inclined to adhere to my statement on page 2,448 as about right.

Q. Well, then will you look at page 2375 of the present record and say whether you did not state the net earnings for 1905 to be $6,175,342.94 according to your computation or method of treatment and did not state the estimated net earnings for 1907 to be $4,065,895.00 or more than $2,000,000 less?

A. Under the conditions placed there, using the English accountants' methods for computing the cost of gas and the unverified and doubtful items on complainant's exhibit 94, summary of operations for calendar year 1905, given apparent cost of gas found to be 53.51 cents per thousand you will obtain the amount stated, $6,175,342.92 as against the figures obtained from Exhibit 96 given by the Consolidated Gas Company, which figures are $4,587,995.99 and are unverified and doubtful to me.

Q. Well, you say all the items in Exhibt 94 are doubtful, which go to expenses?

A. This is Exhibit 96.

Q. I know, but you have referred to Exhibit 94, showing the cost for 1905, and you stated that all those items are doubtful because you have not verified them. If then you exclude the doubtful items as you say you do, you would exclude all items of expense, would you not, and do you get any amount to allow as operating expenses?

A. I think that you perfectly well understand in this wholly extraordinary method of making out the cost of gas that has been pursued for years, the difficulties under which I am laboring and the difficulties under which any man accustomed to ordinary
2601 business labors. It is accepting simply what you choose to hand out and nothing more than that.

Q. I will see about that in a minute. Meanwhile do I quote you correctly from page 2375 where you say "under the English accountants' methods for computing the cost of gas and the unverified and doubtful items of Complainant's Exhibit 94, summary of operations for the calendar year of 1905, the apparent cash cost of gas is found to be 53.51 cents per thousand of gas sold, and the total net earnings $6,175,342.94" and a little below; "with the price of gas at 80 cents and its cost at 53½ cents, the net earnings for 1907 will be $4,065,895.00." Have I quoted you correctly so far as I read, or have I quoted correctly what you have said?

A. Apparently, yes.

Q. Then, even upon your statements, and with gas computed in each case at 53½ cents, the net earnings for 1907 would be something more than $2,000,000 less than in 1905, would they not, if those statements of yours are correct?

A. You have given that partially and incompletely, for I have added, in handling this subject, that that seems to be something near right. I have added this, on the figures derived from Chicago, that the profits will be $5,293,335.

Q. I am taking the cost of gas there as the same in 1907 and in 1905 in the computation, as you did at this point. Now on that basis the net profits from gas would, as you state at page 2375, be more than two million dollars less in 1907 than in 1905 upon your basis of computation. Is that correct? Let me have a direct answer, please.

A. Subtracting the one from the other and acting as your computer in this matter, $2,109,447.94.

Q. Now, referring to your previous statement which you
2602 said a few minutes ago you stood by, on page 2448, that the
net profits in 1907 on your computation would be greater than they were in 1905, will you not say, whether if gas in 1907 costs the Consolidated Gas Company to produce only forty-five cents as against the 53½ cents that you accept for 1905——

A. Would you mind dividing up that question?

Q. I cannot very well. Would not the net profits in 1907 still be less than in 1905?

A. Will you kindly give me the first statement that I said I stood by?

Q. Page 2448, the first question I asked you on page 2375 you said it would apparently be $2,109,000 less than it would be in 1905. Now I ask you if we were able to manufacture gas for forty-five cents in 1907 and we took the cost of gas in 1905 as 53½ cents, if the net profits in 1907 would not still be less than they are in 1905?

A. Bringing my reply down to a few concrete figures to you, my statement was that the probabilities were that the profits in 1907 would be $5,293,335.00, more or less and that you or the Consolidated Gas Company had claimed that in 1905, Exhibit 96, your profits were $4,587,995.99. That clears that situation up completely and is all that I meant or intended. I cannot answer the question that you put to me beyond that.

Q. Taking the cost of gas for the year 1905 at 53½ cents, will you look at page 2375 of the testimony and say if the total net earnings according to your statement should not be $6,175,342.94 for the year 1905?

A. That is what I believed your profits to have been exactly, although the Consolidated Gas Company stated that it was $4,587,995.99.

Q. Now, if we assume that in 1907 the Consolidated Gas Company
would manufacture gas at 45½ cents, you state on the same
2603 page that their net earnings would be $5,293,335.00?

A. More or less approximately.

Q. Well, of course. Which would be, would it not, nearly a million dollars less than the $6,175,342.94 which you compute to be the profits of the Consolidated Gas Company for the year 1905?

A. But which you state to be $4,000,000——

Mr. Mathewson: I move to strike that out.

The Master: Strike it out. Answer the question and it will save all of us time. We understand what you claim about this, you have made yourself clear, and the main thing to do now is to answer these questions as they are asked.

The Witness: Yes.

Q. You have referred again to what you say was the inability to get information, and I propose to ask you one or two more questions on that subject. Is it not true that on or about September 19, you called at the office of the Consolidated Gas Company and saw Mr. Carter and asked to be shown the Real Estate Account from 1884 to date. Is that right?

A. I called at the office about that date as near as I can recall and asked for that and a great deal more besides.

Q. That may be. Your answer to my question is yes, then, is it?

A. No.

Q. Is your answer no?

A. It is not necessary for me in an ordinary matter of business to answer unqualifiedly. I am not in a matter that cannot be treated in a rational way.

Q. Did you ask him to be shown the real estate accounts from 1884 to date?

A. I did so, and other matters.

2604 Q. And he told you that as this account was not in evidence for that period it could not be shown to you by him, is that right in substance?

A. It was not shown to me by him.

Q. Did he not state that as the account was not in evidence for that period it could not be shown to you by him, or didn't he say that in substance to you?

A. I related all of that as well as I could in a letter which I can find——

Q. Oh, well, that letter we have all seen. Now, Doctor, I will ask you to answer my question if you will be good enough. You brought this subject up yourself repeatedly, and I am going to find out about it. Now, will you answer the question?

A. I will offer you the letter or read it to you in reply to your question.

Q. No, I decline to have you read from it.

The Master: The letter is in evidence.

(Question repeated as follows):

"Did he not state that as the account was not in evidence for that period it could not be shown to you by him or did he say that in substance to you?"

Mr. Burr: If he needs the letter to refresh his recollection as to what occurred, I suppose he may use it.

Mr. Mathewson: I have no objection.

A. The interview at that time was rather indefinite and definite replies——

Q. Can you not answer that question?

A. I do not recall whether he did or not at that meeting.

Q. Do you mean to tell me that you cannot remember so far back as September 19 in respect to a matter upon which you have placed so much and so repeated stress in your examination?

A. I can state the exact fraction to you where they are definite from this letter, if you wish it.

2605 Q. You don't remember whether he said that or not, you say?

A. He did not show me the account.

Q. Didn't you comment on the exhibits which had been presented, showing the cost of gas and state that there had been no adequate audit of them to determine whether the charges in the various operating accounts had been made or whether items of expenditure properly chargeable to construction had not been charged in the operating expense account, or didn't you make statements in substance as I have recited?

A. I was very much dissatisfied with what I had obtained and expressed that dissatisfaction to Mr. Carter, asking for further information. I do not recall any commentary.

Q. Did not Mr. Carter in reply to your statement say he would be very glad to have you satisfy yourself on these points by as complete and elaborate an audit of the operating accounts for 1905 as you might choose to make, including original vouchers and payrolls, and that he would place at your disposition as large a corps of clerks as you might require to assist you in making such an examination. Did he say that to you or say that in substance?

A. He deferred definite reply on all matters until after a consultation, which consultation was reported to me as to the results, over the telephone, I think, the next day.

Q. Didn't he say in substance to you what I have just recited?

A. At that time?

Q. O, yes.

A. There was no definite promise that I——

Q. Didn't he say so the next day after the telephone conversation?

A. Exactly what I related in my letter, he made a verbal statement that he would furnish facilities required for the examination of the operating ledgers in evidence and a comparison of the vouchers and subsidiary books and payrolls.

2606 Q. Now, didn't you ask him to put that in writing and didn't he subsequently tell you that he would not put it in writing, but that the accounts were open to your inspection as he had offered? Now, just *just* give me an answer, please, to that, Doctor. And didn't he tell you so within twenty-four hours after that first conversation?

A. At four-thirty on the afternoon of the following day he stated amongst other things——

Mr. Burr: Is this over the telephone?

The Witness: Over the telephone, verbally, that he would not reply to it in writing but was willing to furnish me with all the facilities required for the examination of operating ledgers in evidence and a comparison with the vouchers and subsidiary books and payrolls, refusing all else that I had asked.

Q. Did you go after that to the office of the company and make any examination such as he offered, or did you go off and write the letter to which you are now referring and which has been offered in evidence?

A. I conferred with the Corporation Counsel, stating to him at the time that such an examination would be merely a partial and incomplete one, of one portion of the works and the last phrase of this letter was suggested by the Corporation Counsel himself.

Q. No matter about that. I don't think that is necessary.

The **Master**: That does not answer either of the questions you were asked. The question was whether you went there and made the examination or whether you wrote that letter?

The **Witness**: I did not go there and I wrote the letter.

2607 Q. Then you did not avail yourself and have not since availed yourself of the offer at all which Mr. Carter made you to submit to you these vouchers, payrolls and records?

A. I was unable to do so on account of being engaged in getting evidence or in giving it.

Q. Then I hope we shall not hear any more about no information being granted to you and no examination of the records of the company possible, because they were refused.

By Mr. **Burr**:

Q. You stated your reasons in the letter why you did not accept the offer?

A. I did.

The **Master**: You can bring that all out, Mr. Burr; and, besides, he is now pretty clear on that, I think.

By Mr. **Mathewson**:

Q. Now, you have said a great deal about the methods of the English accountants and I would like to ask you some questions in that regard; when you say that reports can be obtained for a shilling by anybody, you simply mean, do you not, that anyone who sends a shilling can get a copy of the regular report which is submitted in Great Britain the same as anyone sending a dollar to Washington for a copy of a patent that has been issued can get a copy of the patent. Do you mean they can get anything more than that?

Mr. **Burr**: The law is in evidence and a copy of the account which the tax payer or consumer is entitled to is also in evidence in an exhibit offered by the city.

Q. Is the report referred to anything more than the ordinary report of the company which is available to everybody, the regular annual report?

2608 Mr. **Burr**: If the Master likes to see the kind of a report they are entitled to, there it is.

Mr. **Mathewson**: They are bound by law to print it in manifold.

Mr. Burr: You cannot get such a comprehensive report as that from the Consolidated Gas Company or any other company here.

Mr. Mathewson: Perhaps not.

Mr. Burr: I submit that the copy of the report and the law providing for its delivery to the person paying the shilling is in evidence and speaks for itself, and a copy of which the Master now has in his hands.

The Master: That is true, but in view of the witness's statement on direct examination I think it is proper to ask the question on cross-examination.

A. Referring to Reeson's *Complete Gas and Water Gas,* 1817 to 1902, with full index, accountants, appointment of, to examine affairs of undertaker, Gas Works Clauses Act, S. 35, page 47; also page 219 under the heading of "Accounts," Gas Works Clauses, 1871:

"The undertaker shall fill up and forward to the local authority of every district within the limits of the special act on or before the 25th day of March in each year, an annual statement of accountants made up to the 31st day of December then next proceeding as near as may be in form and containing the particulars specified in Schedule B to this Act annexed."

Q. My question merely is whether there is anything more that you can get for a shilling than a copy of that regular annual
2609 report, that is the whole question.

A. I have told you all that can be gotten here. If you allow me to finish——

Q. I do not really think it is necessary.

A. I am not a lawyer. I can read you the Acts of Parliament and that is as near as I can give you the information you are asking for.

By Mr. Burr:

Q. Just refer to the schedules and give the headings of what, contained in the schedules, they are obliged to give; contained in the accounting that they are obliged to give.

A. The schedules are on page 224:

"Form of annual accountants, statement of share capital, statement of loan capital, statement of capital account, revenue account for year ending, profit and loss account."—

Q. All in detail?

A. All in detail.

"The reserve fund account, statement of coals, statement of residual products, general balance sheet," following one after another.

Q. Doesn't it also provide that regular accounts must be given for depreciation fund for works on leaseholds, if any?

A. It does.

Mr. Mathewson: Now, I repeat my question.

By Mr. Mathewson:

Q. When you referred to the report which could be obtained for a

shilling by any shareholder it was simply a copy of its regular annual report that you had in mind?
A. That was all that was intended.

2610 By Mr. **Burr**:

Q. In addition it contains a general balance sheet, does it not?
A. Yes, that I have stated here.

Mr. **Mathewson**: That all is shown in what was previously in evidence. My question could have been answered in three words, or one in fact.

Q. Now, you have testified that the system of accounts employed by the English companies is superior to that employed by the Consolidated Gas Company, as I recollect your testimony. Do you know whether all English and British companies employ the same systems of accounts?
A. I do not.
Q. To what system of accounts do you refer then?
A. Those I just read over.
Q. Do the British companies employ the same system as that employed in the case of gas works owned and operated by municipalities in England?
A. System of what?
Q. System of accounts, of course.

Mr. **Burr**: The same system of keeping accounts or publishing them.
Mr. **Mathewson**: The same system of accounts. The witness has repeatedly referred to the system of accounting in Great Britain. Will the Stenographer repeat the question.
The **Stenographer** (reading): Do the British companies employ the same system as that employed in the case of gas works owned and operated by municipalities in England?

A. I have received accounts from a municipal plant and I have models of other accounts and I have looked it up and found out how much——
2611 Q. Don't you know from recollection on that?
A. They might differ by one word.
Q. That is the best answer you can make without looking it up?
A. Yes.
Q. Now, referring to the English system of accounts as commended by you, will you take Field's Analysis for 1905 and point out wherein the system there employed differs from that of the Consolidated Gas Company?
A. I didn't know that the Consolidated Gas Company had any definitely stated system.
Q. Oh, you didn't know they had a system of accounts?
A. No.
Q. I thought you said Mr. Heyward told you it was one of the best system- of accounts he had ever seen?
A. Oh, no, he was lost in admiration of the accuracy of the additions and subtract-ons.

Q. Then as far as your own information goes, you are not able to point out from Field's Analysis that there is any difference between the Consolidated system of accounts and the British system of accounts, do you?

A. I took very great pains, referring to page 2338, segregation of Exhibit 94, to make as close an approximation as I could to the heads under which British costs of gas are frequently found.

Q. Now, you understand that in the State of New York companies are forbidden to charge meter rental and that the price which they receive for gas covers both the gas delivered and the use of the meter which belongs to the company, do you not?

A. I am not posted on that.

Q. Do you not know that the companies here are not permitted to charge a meter rental?

A. I do not.

Q. Well, then, I see that in taking the price charged by the British companies, you took merely the price paid by the consumer
2612 for gas but did not take the amount paid by the consumer, for meter rental according to Field's Analysis, was that right?

A. Referring to what?

Q. Referring to your statement of the price at which gas was sold in London by the three Metropolitan companies. If you include the amount received by the London companies as meter rentals and as shown in Field's Analysis?

A. I presume you refer to page 54 of my affidavit?

Q. Yes, which you have quoted in your testimony here. Where you state the average is sixty-two cents for all Metropolitan companies.

A. Meter rental, stove rental and miscellaneous receipts were deducted from the net cost of coal and working expenses instead of being added to the price of gas to obtain the profit on capital employed.

Q. Yes, but in the price which you said was received by the company per thousand cubic feet you did not include the amount received by the companies as meter rentals, did you?

A. I did not.

Mr. Burr: Are you speaking of the English companies?

Mr. Mathewson: Yes.

Q. Now, if the London companies receive a certain amount for gas and a certain amount for meter rentals these two sums should be added together in comparing the price of gas with New York city, should they not, if it be true that the companies in New York cannot charge meter rentals, but the use of the meter as well as the gas furnished is covered by the amount received from the consumers in New York?

A. Referring to Field's Analysis for 1904——

Q. I do not think that will answer the question.

A. If the English companies do receive meter rentals in such cases in comparing the gross revenue of an English company
2613 with that of a New York company it would be proper to take cognizance of the meter rentals.

Q. Should not the meter rental in that case be added to the price of gas, as you have stated it for the three London companies, before comparing with the price received by the Consolidated Company in New York?

A. In the case of two of the companies, yes.

Q. Two of which companies, the London companies?

A. The Commercial and the South Metropolitan Company receive a meter rental. In the case of the Gas Light & Coke Company, not receiving any meter rental, it probably could not be.

Q. Will you state what the meter rental is stated at in Field's Analysis for each of these companies?

A. For the year 1904?

Q. For the same year with which you are dealing when you stated the selling price at page 54 of your affidavit as averaging sixty-two cents?

A. Meter rental, folio 3, Field's Analysis 1904, the Gas Light Company, nothing at all; the Commercial, per one thousand sold, 1.63 English pence.

Q. About how many cents would that be?

A. There are 2.03 cents to each English penny; that would make about 3.3 cents, I should judge.

Q. And that added to the figure of fifty-eight cents at page 54 of your affidavit would give 61⅜ cents?

A. Something of that sort. In the South Metropolitan Company 1.21 pence, which multiplied by 2.03 will give you about 2.4 to 2.5 cents which, added to forty-nine cents will give you 51.5 cents.

Q. Of course, you know that the cost of the production of gas in Great Britain is very much less than it is in New York or in America generally, do you not?

A. That claim is made.

Q. You never have operated a gas plant there yourself?

A. Never.

2614 Q. Isn't it a fact that every one of the British companies shown in Field's Analysis of the London companies, the suburban as well as the city, do charge meter rental except the Gas Light Company of London, according to the statement in Field's Analysis?

A. It would so appear from Field's Analysis.

Mr. Burr: I suppose it will be conceded that the Gas Light Company of London is the largest company there?

Mr. Mathewson: Yes, I think that is right. The largest company in London and they charge the highest price for gas, according to the Doctor's statement, which is undoubtedly so.

Mr. Burr: You mean by "Doctor," Dr. Humphrey's statement?

Mr. Mathewson: Oh, no, according to Doctor Marks' statement.

The Witness: I beg your pardon, I am not a doctor. Just plain "Mr."

Q. Now, let us look at your affidavit further on the subject of London companies—you state in your affidavit, do you not, that the profit on capital employed, amounts to 8.39 per cent. in the case of the Gas Light Company?

A. So it reads.

Q. And for the Commercial the profit per cent. on capital employed is 8.72 cents?

A. Yes.

Q. And the South Metropolitan is 7.58 cents, at page 54?

A. Correct.

Q. Or an average for the three Metropolitan companies of 8.24 cents profit on the aggregate capital employed?

A. "Profit on capital employed," is the heading.

Q. Now, you also said that the per cent. of profit on stock,
2615 share and premium capital excluding premium on debenture
stock is for the Gas Light Company 9.35 per cent., for the
Commercial Company 10.86 per cent., for the South Metropolitan Company 8.85 per cent., and the average for three Metropolitan companies is 9.32 per cent.; is that correct? You so state in your affidavit on page 54?

A. Yes. It is a valuation from a statement in Field's Analysis.

Q. And you believe it to be true, of course?

A. Yes.

Q. And you also state that the average profit realized on all the capital employed by all the Metropolitan companies of London appears to be 8.25 per cent.?

A. Yes.

Q. Now, isn't it the fact, Doctor, according to your information that the London companies were paying as high as 10 per cent. and the South Metropolitan, indeed, as high as 12 per cent. about twenty years ago and that they were permitted substantially to double their stock, paying upon the double stock about as much per cent. in dividend or something like that?

A. Yes, that was related in my direct evidence.

Q. Yes, so I understood. In other words, the lower rate of interest or return now paid on the share capital is upon double the amount of the original capital?

A. Yes, that was the first issue, and some others that were joined to that.

Q. Referring to electrolysis, isn't it possible to tell the pitting due to an electric current from the pitting that occurs in iron pipes by reason of disintegration from other causes?

A. Well, electrolysis consisting of a carbon and iron battery with an alkaline solution in contact with it does not differ in its general appearance from electrolysis occasioned in any other way. In other
words, you cannot tell if the electrolysis occurred—and it oc-
2616 curred fifty years ago, in many cases before we ever heard of
any wandering currents. You cannot tell by looking at it
just what it might be laid to.

Q. But is it all pitting due to electrolysis of one kind or another?

A. Is it all pitting?

Q. Yes.

A. Oh, no, I cannot say that.

Q. Then my question is whether you cannot detect the pitting due to electrolysis in iron pipes form pitting due to other causes?

A. In using the word electrolysis, you mean electrolysis due from possible wandering currents or electrolysis due to the action——

Q. I used the term exactly as you did a moment ago, where you said it was all electrolysis where electricity was concerned——

A. Did I?

Q. I thought so, yes. Now, my question is whether you cannot detect pitting due to electrolysis in an iron pipe, whether due to this spontaneous battery to which you have referred or to stray currents, from pitting in iron pipes due to other causes than electrolysis?

A. No.

Mr. BURR: There are only two causes given, stray currents and the electricity in the earth itself.

Mr. MATHEWSON: That is all electrolysis and Dr. Marks says there is pitting in iron pipes which is not due to electrolysis. My question is whether you cannot determine by inspection whether pittings are due to electrolysis or due to other causes.

The WITNESS: Electrolysis is like medicine. You cannot tell what would have happened if you had not given it.

Q. Of course, but I think that does not quite answer my question. You say that the pitting is due to electrolysis in some cases and that in other cases pitting occurs without the existence of electrolysis.

A. Unknown causes.

2617 Q. My question is, cannot an expert determine by the character of the pittings whether they are due to electrolysis or whether they are due to some other cause?

A. I should think the only way would be to use electrical instruments to determine whether or not there was electricity there.

Q. Even if mains may rest in an ashy or alkaline soil and therefore there will be some electrolysis from this natural battery, is it not true that additional or stray currents of electricity will greatly augment the pitting?

A. There is no doubt that there is such a possibility, but it depends so largely on conditions outside of mere existence of the currents that you cannot say.

Q. Is it true even where mains are not laid in any ashy *of* alkaline soil and where consequently there is no natural battery set up as you have mentioned the pipes will still be affected by electrolysis where stray currents of electricity come in contact with them?

A. Of course my experience in that matter is very limited, but I never found where there was very great agitation for about nine or ten years——

By Mr. BURR:

Q. Agitation of what?

A. Of the subject of electrolysis; but for nine or ten years there was a continuous discussion in the way of suggestions and accusations against the Philadelphia Edison Electric Light Company of which I was engineer and president, and which had a ground neutral, carrying that all the time. There never was any case where it could be definitely said that the damage had been done by electrolysis by reason of the grounded neutral.

2618 Q. Do you not know that the subject is considered of such importance by the American Light Association that they have appointed a special committee of most competent experts to consider the subject and to report how it can be guarded against and treated with?

Mr. Burr: I do not object to the question if he leaves out "most competent experts." I don't know whether the professor knows anything about it or not.

Mr. Mathewson: If he does not, he can say so. I suppose he knows who they are.

A. I know that such a commission has been appointed.

Q. And don't you know that the Water Pipe Association—I am not sure of their name exactly—have appointed a similar committee in view of the danger to their pipes?

A. You mean of what locality is the water pipe?

Q. Well, it is the Water Works Association of America—Doctor Humphreys gives me the exact title.

A. That is my first information. I have not paid much attention to water works.

Q. Didn't you testify substantially that an electric current in passing is in strength inversely as to resistence?

A. That is Ohm's law. The quantity of the current is inverse to its resistence, indirectly as to electromotive force.

Q. If that is true, will there not necessarily be some current straying from the return conductor, provided the conductor is not completely insulated?

A. Referring to any form of conductor that is true. Insulation can hardly be made absolute and perfect.

Q. And it is true then that unless the return conductor, no matter how large it may be, is completely insulated, there will be some current straying therefrom which would involve possible
2619 electrolysis in a neighboring pipe?

A. Unless picked up by large masses of iron before it got there.

Q. Now the surface roads in New York City—the underground trolley surface roads, have as you knew, I suppose, return conductors?

A. Yes.

Q. And you would not expect that that would have much effect, if any, in electrolytic action on the neighboring pipe, would you?

A. I should think not.

Q. Now taking the elevated structure, the road there having no such return conductors as the surface roads, as I understand it, do you contend that on account of the large mass of iron in the elevated railroad structure there can be no stray currents or conductors except the elevated structure itself?

A. In electricity everything is relative, and Ohm's law obtains everywhere. It would appear to me that the iron is so much greater in the elevated structure that the chances are very small indeed of any currents ever getting off it, even with bad rail connection, appreciable currents.

Q. When you say any currents getting off from it, isn't it true that electric currents even passing through conductors from the point of generation to a distant point where employed as a motive force suffer some loss in that way?

A. I say appreciable currents.

Q. Don't you think that the current on the elevated railway can pass into the street from the foot of the columns, even if those columns may be insulated by concrete settings?

A. No doubt it can. Electricity will find its way out by the easiest passage that presents itself at any and all times.

Q. You said in your testimony, if I understood you, that Doctor Humphreys did not limit the accumulation of a reserve fund to any sum and you subsequently corrected that by saying that 2620 he did limit the five cents per thousand which he claimed to some amount equal perhaps to ten per cent. of the capital, but that he did not do this at first. You know that Doctor Humphreys was called only once before the Gas Commission and once before the Master here. What do you mean by saying that he did not at first limit——

Mr. Burr: Are you referring to any particular page?

Mr. Mathewson: The testimony of the witness, which I suppose he has in mind.

A. In regard to this matter, page 2390, I would say that my memory was not very good, nor even now very distinct on that point. I said that lately President Humphreys had agreed to the reserve fund of ten per cent. on the capital. Whether that referred—I heard President Humphrey's testimony before the Gas and Electricity Commission. I also heard it here and it is quite impossible and I presume unimportant, for me to find out whether it referred to the Gas and Electricity Commission or to this evidence.
